Within the past year, the Radio Section has cooperated in the preparation or production of radio and transcription material with the following agencies and offices: Navy Department, War Department, Coordinator of Inter-American Affairs, the Public Health Service, the Office of Education, Bonneville Power Administration, Bureau of Reclamation, National Capitol Parks Service, Petroleum Adminis-

tration for War, Solid Fuels Administration for War, Federal Coal Mines Administration, War Manpower Commission, Office of War Information, Department of Agriculture, Office of Strategic Services, State Department, Labor Department, Federal Securities Agency, Office of Civilian Defense, and the U. S. Maritime Commission.

PHOTOGRAPHIC SECTION

The photographic laboratories furnished a considerable number of documentary photographs to the various offices and bureaus of the Department, thereby creating a savings of thousands of words of descriptive matter in official reports and scores of work-hours on the part of Interior employees. Illustrations and pictures produced in the laboratories proved to be of great value from a documentary standpoint before congressional committees, in conducting investigations, in promoting morale, in keeping the public informed of the progress of Departmental war projects, and in many other ways.

The personnel of the photographic unit, in addition to their work for the Department, cooperated with outside Government agencies in the production of material involved in their war programs. Photographic work turned out during the 12 months included educational pictures for textbooks, guidebooks, pamphlets and travel literature requested by scientific, trade, and general circulation magazines and publishing organizations.

PUBLICATIONS SECTION

The functions of the Publications Section have been so realigned that it may operate more logically as part of the Division of Information. The Section now takes part in the issuance of publications as an editorial consultant and publisher, instead of functioning, as it formerly did, mainly as a liaison office between the Department and the Government Printing Office. The result is that a unit of the Division of Information now concentrates upon the essential parts of our publications, (the material and the manner of presentation) instead of mere physical appearance.

Interior Department Museum

H. L. RAUL, Museum Curator

THE Interior Department Museum illustrates graphically to the public the accomplishments of all of the Bureaus of the Department. Its exhibits are continually in process of change or modification so that bureau activities and progress will be reflected. The museum visualizes and explains the history and organization, as well as the current activities of the Department, and serves in maintaining contact with the public through a progressive program which is carried out in cooperation with the bureaus and by direct contact with the public.

Approximately 50,000 persons visited the museum during the past year. The Visitors' Register recorded visitors from every State in the Union, and from Alaska, Hawaii, Puerto Rico, Argentina, Australia, Canada, Chile, China, Colombia, Cyprus, Egypt, England, Guatemala, Mexico, Peru, Uruguay, and Venezuela.

With the assistance of the Bureau of Reclamation, the Reclamation exhibit gallery has been extensively redesigned and the installations have been completed. Included are a large mural painting of more than 12 feet in length by Kathryne C. Dimmitt representing Grand Coulee Dam, together with a scale-model of Grand Coulee Dam. Another new scale-model shows a typical concrete cooling system.

The museum during the past year has, upon request, cooperated with numerous agencies, including the National Archives, Smithsonian Institution, The Boston Art Museum, Junior Board of Commerce of Washington, and The American Society of Civil Engineers. Assistance has been rendered to school organizations and other groups in preparing study courses relating to Conservation, the National Parks, Reclamation, and other subjects in which the Department is engaged.

An animated diorama recently installed in the Bureau of Mines gallery illustrates Bureau of Mines inspectors at work in a mine. A silhouette, which is 6 feet in length and which depicts the methods employed in early surveys of the public lands, was designed in the museum and installed in the General Land Office gallery.

New books which have been added to the museum collection, include *The Biography of William Howard Butler, 1856-1934*, painter of the full-length portrait of Gen. Hugh Lenox Scott, now in the possession of the Department, and the recently issued *Catalog of the Type Specimens of Mammals in the United States*, by Arthur J. Poole and Viola S. Schantz of the Fish and Wildlife Service. A conversion lens extension for the sound-motion picture equipment has been supplied by the Bureau of Mines for the special showing of educational films of the Bureau.

A quantity of exhibit material has been received from the Division of Territories and Island Possessions and from the National Park Service.

The special exhibits displayed during the year included a panel containing the text of the Atlantic Charter; panel exhibits showing the flags of the United Nations, and the flags and coats-of-arms of the American Republics. Another special exhibit of general interest featured the Seal of the Department of the Interior together with stamps relating to the Department and events in the history of the United States. A retrospective special exhibit was designed to include a group of historic prints made from original photographic negatives taken by the late William Henry Jackson (1843-1942), official photographer of the United States Geological Survey, and member of the historic Hayden expeditions of 1871-72. The early Jackson photographs, made with cumbersome wetplate cameras carried on muleback, were largely instrumental in influencing the act of Congress which established Yellowstone National Park, the first park of the great National Park System of the United States. Also among the special exhibits shown during the year was a rare cormorant and wolverine parka, made by Eskimos at Mekoryuk village on Nunivak Island, Alaska. Another timely exhibit, included an elaborate display in three exhibit cases in the Geological Survey gallery showing specimens of strategic minerals from which are produced the metals required for the construction of war implements. Many relatively rare minerals shown are of vital importance in the production of essential war materials.

The specimens displayed were indicative of results obtained in the intensive search for additional sources of these minerals in the United States, Alaska, and Latin America.

Conducted tours of the museum galleries were held throughout the year for teacher groups, and public and private school classes.

Since its establishment by the Secretary, on March 8, 1938, as a new instrument in the field of Government-public relations, the museum has been a focal point of educational interest in the Nation's Capital. It has grown in usefulness to the Department and in popularity with the public.

Civilian Conservation Corps

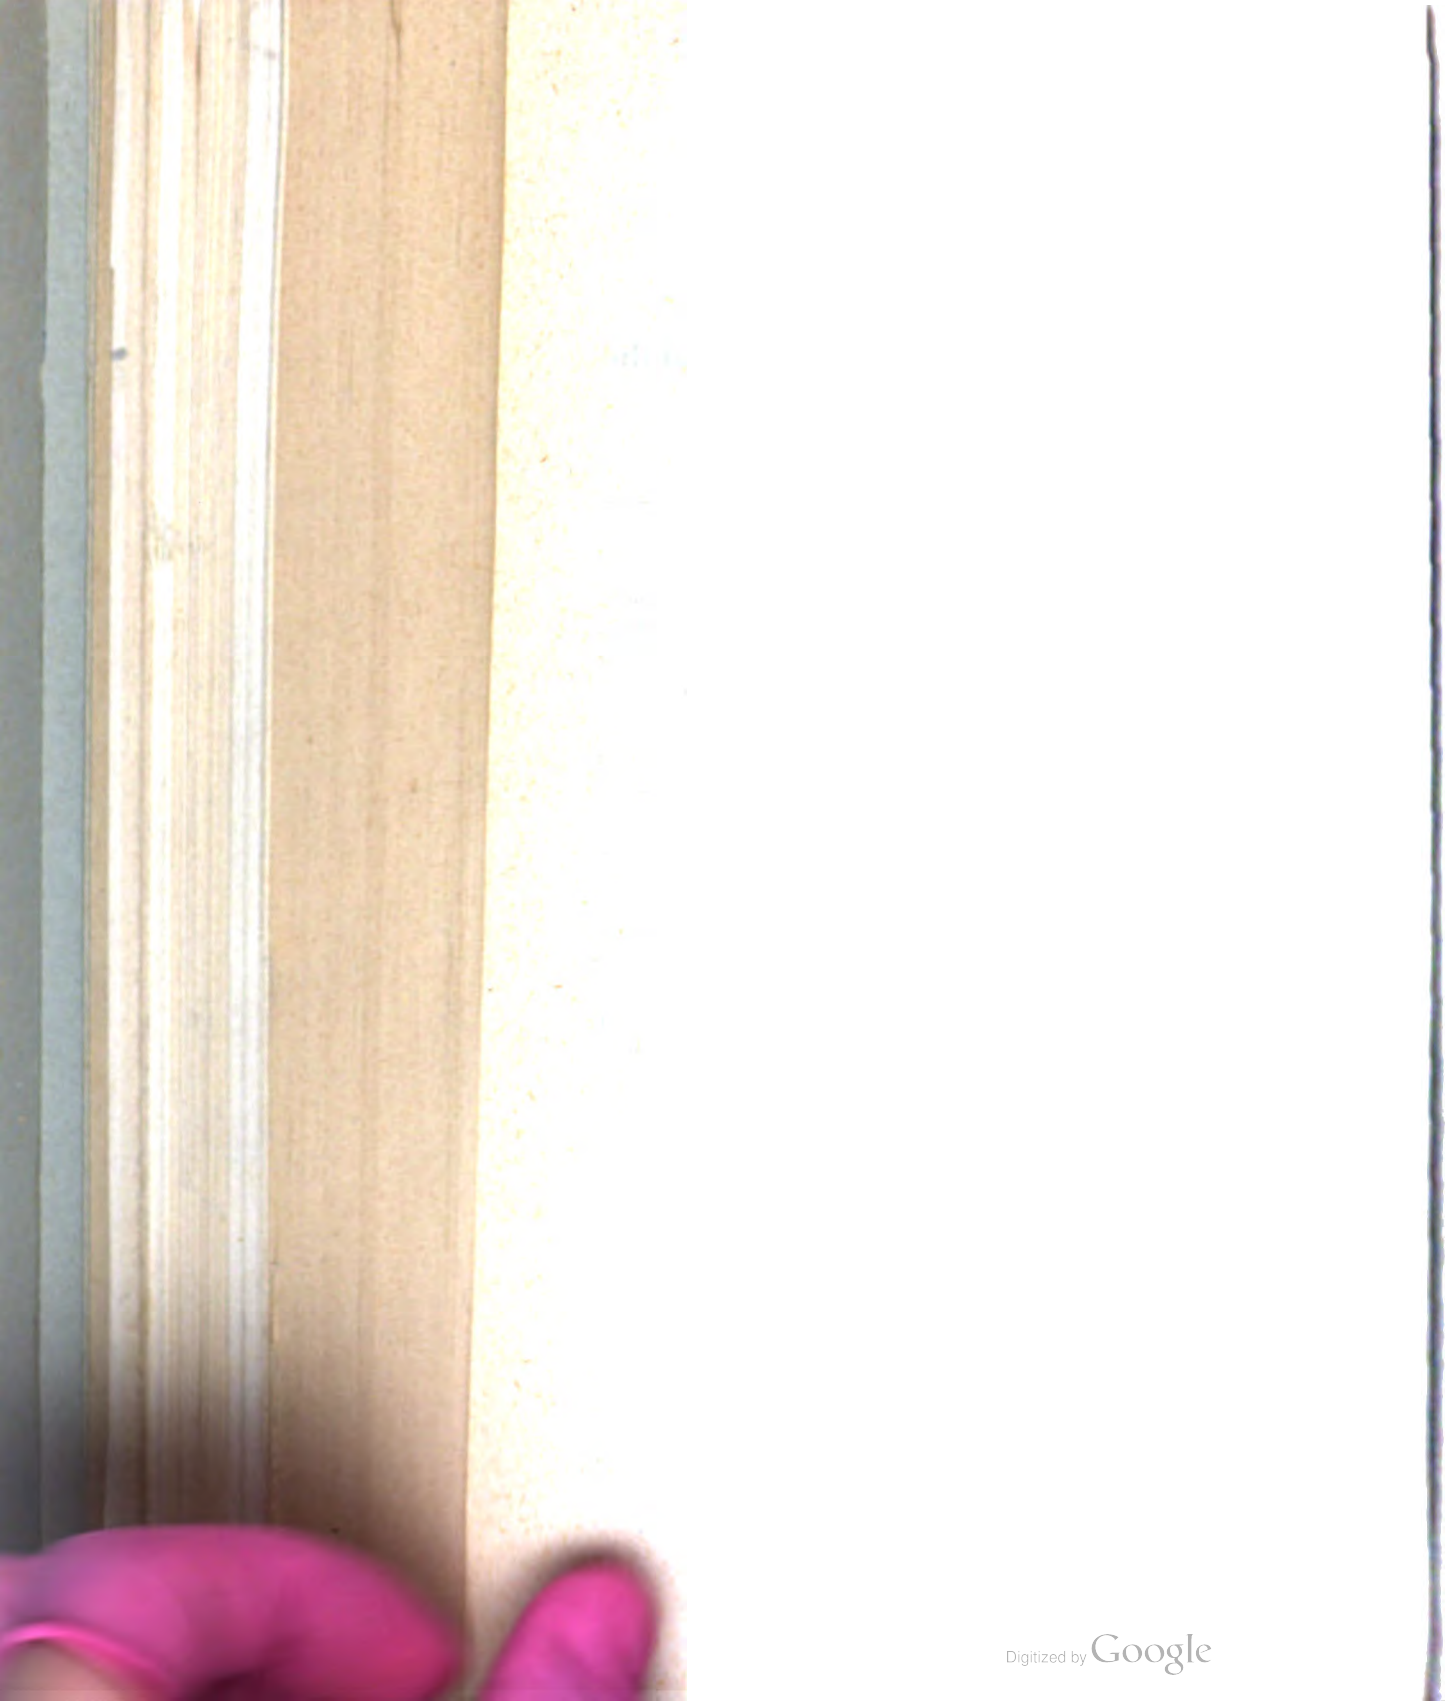

CONRAD L. WIRTH, Representative, Department of the Interior, Advisory Council, CCC

LEGISLATION abolishing the Civilian Conservation Corps was passed on July 2, 1942. The appropriate bureaus of this Department acted promptly in accordance with Title II, Public Law 647, Seventy-seventh Congress, and with instructions of the Director of the CCC which provided for the immediate disbandment of active camps, the separation of personnel and prompt disposition of property. These agencies, that is, the General Land Office, the Office of Indian Affairs, the Bureau of Reclamation, the National Park Service, the Grazing Service and the Fish and Wildlife Service, had virtually concluded all of their CCC affairs by the end of the fiscal year.

The largest and longest task was to inventory, offer, and transfer all CCC properties in possession of the Department, including camp buildings and their operating accessories, automotive and other heavy construction equipment, light equipment, tools of all kinds, engineering equipment and supplies, office equipment, furniture and supplies and in many cases beds, bedding, kitchen and dining room equipment, food, etc. These properties were transferred to the War Department, Navy Department, and Civil Aeronautics Administration for war use or, in succeeding priorities, to other Federal agencies, to State, county, municipal agencies, and nonprofit organizations for the promotion of conservation, education, recreation or health.

Excluding camp buildings, which were credited to other accounts, CCC properties transferred by the six concerned bureaus of the Department of the Interior during the fiscal year 1943 were as follows:

General Land Office.....	\$147,867	Grazing Service	\$1,555,483
Office of Indian Affairs...	3,859,944	Fish and Wildlife Service..	1,730,320
Bureau of Reclamation...	836,887		
National Park Service....	8,347,256	Total.....	16,477,757

Letter of Transmittal

The Secretary of the Interior

Harold L. Ickes, Secretary

MY DEAR MR. PRESIDENT: The time approaches when the Nation will cease to produce for war, obliging us to find new and stable uses for the facilities which we have developed in the greatest proportions in order to hasten victory.

During the past fiscal year, we have concentrated upon those facilities that provide the necessities of war from the natural resources. We have hastened the construction of huge dams and the installation of generators to furnish power for war production plants. We have extended our irrigation facilities to increase the production of food for war. We have developed and improved technological processes to account for more fuels and minerals for war and to produce them faster.

If we could lump together as "power" the final results of such developments, then the Department of the Interior would be the steward of an accumulation of power which is probably the greatest that was ever administered under one jurisdiction.

A glance at a few of this Department's developments indicates how enormous they are in the aggregate. The Department's installed capacity for the generation of hydroelectricity at the end of the fiscal year was nearly 2,500,000 kilowatts, roughly three times the entire developed capacity in South America in 1935, or one-half of that in Asia (including Soviet Asia), at the same time. We generated 13,747,000,000 kilowatt-hours of electricity during the past fiscal year, about four times the amount that was used in Michigan in the manufacture of automobiles and automobile parts in 1939. We irrigated more than 4,000,000 acres of land, equivalent to the acreage that is planted to crops in Louisiana in a normal year. We have affirmed the presence of so many large deposits of essential ores that the effect would not be different if we had annexed a couple of mineral-rich States.

Secretaries of the Interior

from March 8, 1849 to June 30, 1944

Harold L. Ickes

Letter of Transmittal

The Secretary of the Interior

Harold L. Ickes, Secretary

MY DEAR MR. PRESIDENT: The time approaches when the Nation will cease to produce for war, obliging us to find new and stable uses for the facilities which we have developed in the greatest proportions in order to hasten victory.

During the past fiscal year, we have concentrated upon those facilities that provide the necessities of war from the natural resources. We have hastened the construction of huge dams and the installation of generators to furnish power for war production plants. We have extended our irrigation facilities to increase the production of food for war. We have developed and improved technological processes to account for more fuels and minerals for war and to produce them faster.

If we could lump together as "power" the final results of such developments, then the Department of the Interior would be the steward of an accumulation of power which is probably the greatest that was ever administered under one jurisdiction.

A glance at a few of this Department's developments indicates how enormous they are in the aggregate. The Department's installed capacity for the generation of hydroelectricity at the end of the fiscal year was nearly 2,500,000 kilowatts, roughly three times the entire developed capacity in South America in 1935, or one-half of that in Asia (including Soviet Asia), at the same time. We generated 13,747,000,000 kilowatt-hours of electricity during the past fiscal year, about four times the amount that was used in Michigan in the manufacture of automobiles and automobile parts in 1939. We irrigated more than 4,000,000 acres of land, equivalent to the acreage that is planted to crops in Louisiana in a normal year. We have affirmed the presence of so many large deposits of essential ores that the effect would not be different if we had annexed a couple of mineral-rich States.

Letter of Transmittal

The Secretary of the Interior

Harold L. Ickes, Secretary

MY DEAR MR. PRESIDENT: The time approaches when the Nation will cease to produce for war, obliging us to find new and stable uses for the facilities which we have developed in the greatest proportions in order to hasten victory.

During the past fiscal year, we have concentrated upon those facilities that provide the necessities of war from the natural resources. We have hastened the construction of huge dams and the installation of generators to furnish power for war production plants. We have extended our irrigation facilities to increase the production of food for war. We have developed and improved technological processes to account for more fuels and minerals for war and to produce them faster.

If we could lump together as "power" the final results of such developments, then the Department of the Interior would be the steward of an accumulation of power which is probably the greatest that was ever administered under one jurisdiction.

A glance at a few of this Department's developments indicates how enormous they are in the aggregate. The Department's installed capacity for the generation of hydroelectricity at the end of the fiscal year was nearly 2,500,000 kilowatts, roughly three times the entire developed capacity in South America in 1935, or one-half of that in Asia (including Soviet Asia), at the same time. We generated 13,747,000,000 kilowatt-hours of electricity during the past fiscal year, about four times the amount that was used in Michigan in the manufacture of automobiles and automobile parts in 1939. We irrigated more than 4,000,000 acres of land, equivalent to the acreage that is planted to crops in Louisiana in a normal year. We have affirmed the presence of so many large deposits of essential ores that the effect would not be different if we had annexed a couple of mineral-rich States.

Our job soon will be to turn this vast block of power from war to peace. It is a Herculean job but I think that we can master it by shifting, gradually if possible, from war to its nearest economic equivalent in the field of conservation; namely, regional development. But it must be regional development at its boldest. The program must embrace entire areas, usually the basins of great rivers and their tributaries; it must provide for full and unified development of all of the resources within the region, and an ideal program would call for simultaneous attack upon all phases of the job.

There is scarcely a facility of ours that is now producing for war that could not be put to use in such an undertaking. It would absorb such material developments as dams and such tributary activities as surveys and metallurgical processes. The benefits of such a project would be so widespread that, in my estimation, they could easily hold community interest and effort together in the post-war years.

Working in a typical region under a program for unified and simultaneous development, we would provide for irrigation at the upper reaches of a river, for deep-water navigation as far upstream as would be practicable, for barge transportation above that point, and for flood control wherever floods occur. We would impound water for municipal supply, generate hydroelectric power and transmit it for use in factories and homes and on farms. We would determine the location and volume of the ores and the bases of plastics that are amenable to processing or manufacture by means of electricity, and improve the means of processing them. We would forestall or ameliorate the pollution of streams, safeguard the soil against erosion, protect wildlife, and develop recreational areas.

Considered as a means of transition from war to peace, conservation unitized on a great scale, is especially timely, but I think that it is to be commended as well for other reasons. In the long view it is the most economic procedure. When we plan all phases of the job as one we foresee some of the frictions that might develop between one facility and another, and dispose of them in the planning stage. That is where alterations are cheapest. We discover others and correct them at the next cheapest point—early in our operations. By committing ourselves to the development of all of the resources of a region we preclude those conflicts that result from a commitment to half measures; conflicts, for example, between those who would profit and those who would suffer if we generated power for industry without providing against the pollution of the rivers. We reap another advantage in the tendency of each phase in a large-scale development to assist each other phase and to assure its success. A navigable river may join with power in attracting industries that need cheap transportation for raw materials and heavy output.

The advantage of reciprocal benefits among facilities was demonstrated, as on a prearranged proving ground, in the Pacific Northwest where the demands of war production—not our own independent planning—drew our numerous, large, and dissimilar developments into a close-knit unit. The primary need was for hydroelectric power to energize the region's war production plants. But plants needed more ores and deposits that were easy of access. They required water for processing and for municipal supply in the new communities that grew up around new industries. They required improved metallurgical processes and pilot plants and laboratories in which these processes might be proved. In response, we affirmed the presence of iron ores that were a thousand miles nearer than the usual supply, and, as nearby as Arkansas, we disclosed huge new additional deposits of bauxite for urgently needed aluminum which, otherwise, would have had to be shipped from Dutch New Guinea. In many other ways we responded to the region's needs by unitizing our facilities. We have been justified already by a magnificent record in war production in the Pacific Northwest, and we may be justified again by that region's readiness to seize any opportunity that peace may offer for continued functioning. It is ready precisely because its developments are a unit. The functioning of no facility would be delayed for lack of supporting facilities.

Other regions are equally in need of coordinated development of their natural resources. The hurried demands of war production merely dramatized the need in the Pacific Northwest. There are vast areas throughout all of the West in which great potentials would be realized by similar coordination. If we launched a program of full measure to make actualities of these potentials, we might require stronger implementation, but we would not have to strike out on new lines in the field of conservation. From its beginnings this Administration has proceeded in that direction. We have sought better coordination in the development of our resources, and we have assumed increasingly greater responsibility for the equitable distribution of the resulting benefits among the greatest possible number of persons.

You will recall that we requested the return of the Bureau of Mines to the Department to team with the Geological Survey, and that under your second and third Reorganization Plans we brought in the Bureau of Biological Survey and the Bureau of Fisheries, and consolidated them as the Fish and Wildlife Service, the better to unify our conservation program. We proceeded toward the same goal in establishing such new agencies as the petroleum Conservation Division, and in organizing centralized controls such as the Office of Land Utilization. We have consistently shaped our policies toward an equitable use of the natural resources. We have rejected the old conception of a dam

as principally an irrigation project which yields some incidental by-products. We plan each dam with the maximum development of all of its potentials in mind. We have discarded the policy of selling the power from our dams at the busbar and thereafter washing our hands of the deal. Instead we coordinate the production and the transmission of power, carrying electricity over our own transmission lines, and only to those distributors who agree to relay the benefits of large-scale development to the consumers. When we assumed the new function of improving the Federal Range under the Taylor Grazing Act we also provided for the equitable distribution of the resulting benefits by the regulation of grazing on the improved lands.

If we have not been able to unify our facilities at the rapid rate at which we have developed them throughout the emergencies of defense, and war, we have at least prepared for their later unification to the extent that such effort has been possible. We have carried power for war production by preference to points at which it is most likely to be used tomorrow for industrial production. We have established relationships with industry that will facilitate the employment of our metallurgical process and our studies in peacetime pursuits. By means of surveys we have amassed a great volume of data that will assist industry in picking up our hydroelectric power for use when war production ends.

We have also shaped our program to respond to the Nation's needs outside of the field of conservation, mainly by devising a large-scale work program to reemploy returning service men and demobilized war workers. But, in addition, we have sought to provide settlement opportunities in the West and in Alaska. We have carried on research that will give settlers a better chance than their predecessors to succeed on the public lands, and we have asked, or are preparing to ask, for specific legislation that will assure the successful settlement of Alaska where we are committed by circumstance to the most rapid development that has ever occurred there.

We have accumulated these vast assets at a minimum cost when it is considered that we return to the Government in cash receipts about 70 percent of the sums which are appropriated to us. We are tending toward an even greater return, and we have an excellent chance of achieving it if the Congress will appropriate for us relatively small sums with which to complete certain facilities that will earn revenues when they are finished and put to use.

A number of our developments that are well under way, and which represent an investment of about \$100,000,000, are not earning revenues now because we lack relatively small additional funds to pay for completing them. The money which the people have invested in these developments is lying idle when it might be paying dividends in both service and earnings.

Often the lack of a small appropriation to complete a large development does more than merely defer the earning power of an investment: it results in seriously diminishing the investment. To take a specific instance, we have expended about \$25,000,000 on the Marshall Ford Dam, but for lack of about \$126,000, which the House refused to appropriate, we are unable to safeguard the equipment and machinery of that project. The electrical equipment and some other facilities have been damaged by the condensation of moist air in the galleries of the dam, and other equipment and machinery is endangered.

Despite these crippling handicaps and others, our Bureaus have worked together as one department to clear a course for the future while meeting the exacting demands of the moment.

THE BUREAU OF RECLAMATION

Working within the Bureau of Reclamation we contributed mightily to the needs of both war and peace. We provided the power that started many critical shiploads of matériel from assembly lines toward battle fronts where those supplies spelled the difference between victory and defeat. Our service men and women have been better clothed and better fed as a result of foods and fibers that were grown on land which we irrigated. And many returning service men will find a well-planned reclamation program that will help them to reestablish themselves in civilian life—provided that funds and legislative authority are granted.

The framework for that post-war program was completed during this fiscal year. It consists of an inventory of more than 236 irrigation and multiple-purpose projects which can be constructed to create emergency employment and homes on self-sustaining irrigated farms for war veterans and others.

The Bureau carried forward the preparation of the inventory while greatly increasing the production of its 31 power plants on projects in 12 western States and while increasing the crops that were essential to the war program on the 4,000,000 acres which our irrigation systems serve. The outline was presented to the Senate Committee on Post-war Economic Policy and Planning which is seeking the means for a smooth transition from the economy of war to an economy of peace. While the program was prepared to assist in this transition the development of western land and water resources which it proposes would result in lasting benefits—new farms, new homes, new industries, and new cities.

The construction contemplated would provide employment equivalent to 1,250,000 men working for a year—44 percent of them at the site of construction, and 56 percent in the manufacture and transportation of equipment and supplies in every State in the Union. Ap-

proximately 135,000 new irrigated farms would be created and the livelihood of more than 150,000 additional families would be stabilized in regions in which a maximum crop production is uncertain because of a deficient water supply.

The new irrigation systems would serve 6,705,000 acres of new land and furnish supplemental water for an additional 9,364,000 acres of land, now without adequate irrigation supplies. The same reservoirs that would impound the storage water for this irrigation would make possible the addition of 1,765,000 kilowatts of power on existing or authorized projects and would make available 2,579,000 kilowatts of firm power capacity, on projects that are under investigation.

The inventory, surpassing in scope any other program that the Bureau has presented in its 42-year history, was prepared in recognition of the fact that approximately 3,000,000 returning service men, demobilized war workers and others in the West will seek employment. More than 260,000 of this number will be fitted by training and experience to undertake farming on irrigated land.

Furthermore, the program is well suited to meet the need for intensified reclamation in the West. In the 11 far-western States the population increased about 60 percent from 1920 to 1940, while the increase in irrigation has been less than 10 percent. The extension of irrigation, as outlined in the inventory, would increase the purchasing power of the West for products that are produced elsewhere by \$1,250,000,000 annually.

The construction cost of all of the projects in the program would be nearly \$3,000,000,000 on the basis of 1940 prices. An expenditure of \$793,000,000 would be required to complete the 40 projects that are authorized or under construction, so that work on them could be undertaken or intensified immediately. Most of the program consists of potential projects, many of which would require special legislation before construction could be undertaken. Substitutions may be made in the list as surveys of projects and basins are completed.

Approximately 170 irrigation and multiple-purpose projects, and 50 river basins and sub-basins, were under study during the year. Seventy-eight detailed field reports which involve construction that would cost \$547,000,000 are ready to put into effect.

The Bureau's peacetime planning for the orderly agricultural and industrial development of the West and for its accelerated wartime activity continued to bear fruit in the field of power and crop production. There were spectacular additions in our power installation in the fiscal years 1942 and 1943, but achievements during 1944 surpassed even the records of those years. More than 500,000 kilowatts of new power capacity—exceeding the total pre-war installation of the State of Nebraska—were added during the year, the greatest expansion of this kind by a single organization in a single year. Our total

installation of approximately 2,360,000 kilowatts exceeds Reclamation's pre-Pearl Harbor capacity by 1,330,000 kilowatts. The additions that the Bureau made during the war in the 11 far-western States constitute 84 percent of the expansion made in the area by all systems.

The power output matched the unparalleled increases in rated capacity. Approximately 14,500,000,000 kilowatt-hours of energy—a 52 percent increase over the preceding year—were produced. Nearly all of the new energy made available played a direct part in war production. The war industries in the Pacific Southwest were dependent for 50 percent of their power on Boulder, Parker, and other Reclamation installations. The world's largest magnesium plant used a fourth of Boulder's huge 6,333,000-kilowatt-hour output, and aluminum plants took a major portion of the power of Grand Coulee Dam in the Pacific Northwest.

Gross revenues from the sale of Reclamation power reached a new high of \$18,992,000, an increase of \$4,438,000 over the fiscal year 1943. These returns are highly significant to the Reclamation program. Power revenues will repay half of the investment in projects that were outlined at the beginning of the war.

Reclamation's contribution of food for war was increasingly impressive. Increases in 2 basic crops indicated the spirit in which the Bureau and the farmers on its 44 irrigation projects responded to the threat of a food shortage. Potato production in the calendar year of 1943 increased by 52 percent over 1942, and bean production increased by 23 percent.

The potato output was sufficient to provide a year's supply for 31,000,000 persons, and the bean yield to serve 30,000,000. Alfalfa production was also at an unprecedented high. This crop, fed to beef and dairy herds, would provide annual rations of milk for 4,800,000 persons and a yearly supply of beef for 5,500,000 persons.

The acreage in production, the total volume of crops, and the crop values also increased. A total of 4,055,329 acres was served a full or partial supply of water by Bureau systems. These lands produced 10,660,000 tons of food and forage crops, which were valued at \$388,670,969. Eighty-three percent of the area for which the Bureau was prepared to supply water was in cultivation.

Despite the continued restrictions on critical materials, and on manpower for irrigation construction, the Bureau made progress in bringing water to land on which agricultural production could be increased. Under the war food program, the War Production Board issued clearances that will bring under irrigation 243,657 acres of new land and will provide supplemental water to 1,022,125 acres that are handicapped by shortages in moisture. All authorizations were granted in

the fiscal year except for four projects on which work had previously been cleared.

The Reclamation service of providing municipal-industrial water also aided in the prosecution of the war. Supplemental supplies were served to important municipalities, in which the demand was increased by an influx of industrial workers, and to major war industries, including a \$200,000,000 steel plant near Provo, Utah, and the world's largest magnesium plant at Basic, Nev.

At the close of the year the Bureau had in operation, under construction, or authorized, 78 projects in 16 western States. In nearly all of this area rainfall is inadequate for sustained crop production and hydroelectric power is the main driving force in industry. The area that was served by the 52 Bureau projects that delivered water or produced power is populated by more than 5,000,000 persons.

DIVISION OF POWER

As we enlarged our hydroelectric installations and increased our flow of power, new complexities arose in the fields of operation and marketing. The increase in our own installation and production was, in itself, enormous; and on September 1, 1943, the power from the Grand River, Norfolk, and Denison dams was added to our own, bringing the total of more than 3,000,000 kilowatts of installed capacity.

Consequently, we assumed a heavier burden of work and responsibility in the Division of Power. Here we strove, in operating our system and in marketing our power, to prepare for transition to a peacetime economy while meeting the immediate interests of a Nation at war.

This Division organized the Southwestern Power Administration to operate the Grand River Dam and to market the power from the three dams that added their output to ours. This agency, created by authority of Executive order as a wartime measure, is now in full operation.

In the Division of Power as a whole our activities were especially directed toward the establishment of rate schedules and the negotiation of power sales contracts. The Division reviewed or participated in the establishment of a number of rate schedules and in the negotiation of various contracts for the sale of power by the Bonneville Power Administration, by the Southwestern Power Administration, and by the Bureau of Reclamation, and helped to establish rates for the sale of power from the Fort Peck Dam, which was turned over to the Bureau of Reclamation for marketing. Most of the contracts were negotiated on a war duration basis.

The Division also took an active part in determining the allocation of the costs of the Grand Coulee Dam as one step in the ultimate establishment of rates for the sale of Grand Coulee power. Closely allied

to the Coulee allocation are the studies, participated in by the Division, regarding the Central Valley project of California. These were undertaken to determine the best method and the rates at which benefits from the project will be made available to the people of California.

In anticipation of the time when the need of power for war will cease and industry can return to peacetime production, the Division has given considerable attention to the preparation of post-war plans and programs. It has participated in studies that concern the further development of the river resources of the Nation, and in this pursuit it has given much assistance to congressional committees and to individual members of Congress. Attention has been devoted to the problem of the conversion and disposition of Government-owned war plants, and to the establishment of peacetime industrial economies which would be based upon the liberal use of low-cost power. Discussions also have been initiated concerning the disposition of fuel-operated power plants that were constructed during the war for use of Military Establishments. The objective is the incorporation of these fuel plants into the facilities of Federally owned hydroelectric plants as a means of economically providing peaking power or standby power which must now be purchased. In the event that Congress passes legislation authorizing the delivery of power to the Secretary of the Interior for marketing from dams constructed by the United States Corps of Engineers, it is also anticipated that the Division will be called upon to undertake the organization of additional marketing units to dispose of such power.

THE BONNEVILLE POWER ADMINISTRATION

In the Bonneville Power Administration we have also worked toward the restoration of the Nation's industrial balance after the war. The wartime industrialization of the Pacific Northwest has contributed much toward this end. It is widely recognized both throughout this region and the Nation that these gains must be fostered in the interest of a sound economic posterity.

From its inception the Bonneville Power Administration's activities have been planned upon the fundamental idea of regional development. Through the war years, the acceleration of the Government's transmission grid construction program to serve war industries at the same time has provided, some years in advance of schedule, a potent tool for both reconstruction and regional development. In making available low-cost hydroelectric power to the people of the Pacific Northwest, the Bonneville Power Administration is earning both the confidence of the people of the region and a sound position of leadership in regional developmental programs.

Conscious of the responsibilities which attend such a position of leadership, and in order that the policies set forth by Congress in the Bonneville Act might be carried out to the fullest possible degree, the

Administration has established certain guiding principles or objectives in the interest of securing the greatest possible benefit from the resources of the region for the greatest number of people. Briefly, these objectives are as follows:

To make power a tool for true development.—The cheap and abundant electric power of the region must become the means for opening new opportunities for investment, enterprise, and employment—for agriculture, for new industries, for small business and for the home owner.

To provide larger quantities of power at lower rates, thereby increasing over-all consumption. The development of the resources of the region through the use of power as a public enterprise provides a vital ingredient for establishing a sound economic base for private enterprise.

To create new jobs in enduring projects for returned servicemen, demobilized war workers, and others. There will exist a readjustment problem for some 500,000 workers in the Pacific Northwest alone when the war is finished.

To add new wealth creating activities to the taxable wealth of the community. In the final analysis, the economically secure community is the very foundation for solvent national Government.

To establish a higher general standard of living.—With the distribution of abundant low-cost hydroelectric power throughout the region, living can become more enjoyable and work can be made easier for farm dwellers and city dwellers alike.

To insure the national investment in developmental projects of the region. The multiple benefits of the dams and the transmission system which the Federal Government has built—reclamation and irrigation of thousands of acres of formerly unused farm lands, widespread distribution and sale of facilities for bulk freight movement on our rivers—will provide full protection for the taxpayers and full payment of their investment, besides accomplishing the basic objectives of regional development and the enhancement of our national economic position.

As to the feasibility of proceeding toward the foregoing objectives, a recapitulation of the progress that the Bonneville Power Administration had made at the end of the fiscal year affords substantial demonstration:

Approximately 45 percent of all of the electric energy that was consumed in the five Pacific Northwest States of Oregon, Washington, Idaho, Montana, and Utah during the 12-month period ending June 30, 1944, was supplied by the two Federal power plants at Bonneville and Grand Coulee Dams.

During fiscal year 1944, the Bonneville Administration sold 8,741,106,000 kilowatt-hours of electric energy at a total cost to its customers

of \$20,893,363, or an average of 2.39 mills a kilowatt-hour. The rapid growth of the Bonneville Power Administration to its present position as one of the three largest power marketing agencies in the Nation is shown clearly by a comparison with fiscal year 1939 power sales, which totaled only 30,042,911 kilowatt-hours at a cost of \$49,835. The output of the Bonneville and Grand Coulee power plants is averaging between 25,000,000 and 30,000,000 kilowatt-hours a day, or approximately 10,000,000,000 kilowatt-hours a year.

During the 6 years beginning in the fiscal year 1939, when the first generators at Bonneville dam were placed in operation, the Bonneville Power Administration had sold 17,927,787,000 kilowatt-hours with revenues amounting to \$40,885,633. This record of service evidences not only a material contribution to the progress of the war but also a substantial participation in strengthening the industrial and economic base of the region.

THE SOUTHWESTERN POWER ADMINISTRATION

Our war and post-war policy has been further reflected in the work of the Southwestern Power Administration. Although conditions may change before we are able to foresee them, this Administration is designing a construction program to provide carrying capacity which will be essential to our post-war operations. Changes in the program may be necessary before it can be carried out. But the basic plan is being drawn in anticipation of a definite need.

Through the year this Administration provided adequate power and continuity of service at the lowest rates that were consistent with reasonable economic requirements. The average rate was 4.21 mills per kilowatt-hour, and, since approximately 95 percent of the power delivered went to war industries, this low rate has resulted in a decided saving to the tax payer. It has enabled industries to provide essential war needs more economically.

Power continued to flow to the great aluminum reduction plant near Lake Catherine, Ark. In this service to the aluminum plant this Administration continued to operate and maintain 200 miles of transmission lines, constructed and owned by the Ark-La Cooperative of the Rural Electrification Administration. Delivery of power was continued to the Oklahoma Ordnance Works for the manufacture of explosives and also to Camp Gruber, an Army cantonment near Braggs, Okla. The Administration furnished power, as we had previously, to municipalities and Rural Electrification Administration Cooperatives which, in turn, furnish it to war industries.

The Administration pursued its system-interconnection policy with private utilities which aided them in fulfilling their power commitments without service interruptions.

Construction progressed on the Grand River Dam project. A new field headquarters building was erected at a central point, reducing operation and maintenance requirements to a minimum. Considerable protective work was performed in the area below the Pensacola Dam and transmission and substation facilities were extended to accommodate increasing war loads. A transmission line was built to serve a new rubber plant and telemetering with load control was installed for the project itself and for interconnection with the Southwest Power Pool. Under Presidential authority the flood control pool elevation was raised 5 feet at a cost of approximately \$2,000,000.

BUREAU OF MINES

Industry could scarcely be expected to put to immediate post-war use the power which we have generated for war if it had to proceed with prewar materials and prewar knowledge. The sources of some metals would be too distant from the source of power for economic use. Many of the techniques for mass production of heavy equipment by electricity would be undeveloped, and other formidable barriers would stand between our newly developed power and industry's ability to use it. The work that we have done this year in the Bureau of Mines has broken down many such barriers.

We affirmed the presence of mineral deposits that are near our biggest projects and we developed metallurgical processes. We adapted known resources and methods to meet the peculiar emergency needs for certain mineral substances, and we extended the collection and economic analyses of mineral market data.

The information obtained in these endeavors will find wide future application in peacetime, and so will the results of our studies and of our searches for metals, to which I already have referred. But these aids to our transition period resulted mainly, of course, from our response to the demands of war.

The prodigious outpouring of war equipment from the United States to foreign shores—which was assembled in Britain on D-Day and in many remote places at other times—was an enterprise in which the Bureau of Mines may justly claim a share of credit.

In the basic munitions-making field of iron, steel, and ferro-alloys, the Bureau added millions of additional tons of iron ore as reserves, and found deposits of steel-toughening ferroalloys such as tungsten and chromium, and important reserves of fluorspar for the flux that was needed in blast and open-hearth furnaces. The steel industry called for high-quality coke of uniform grade, and coke-oven operators, with technical assistance from the Bureau, provided it. The industry needed vast quantities of scrap metal, and the Bureau not only conducted extensive surveys to assist in scrap procurement, but

its field men helped to find it at abandoned and active mines and mills throughout the country. In addition, extensive research was conducted on sponge iron as a possible substitute for steel scrap.

In the important province of nonferrous minerals, the Bureau's exploratory crews added to the Nation's recoverable mineral resources several million tons of lead-zinc and copper ores, and a year's supply of mercury and commercially exploitable quantities of pegmatite minerals, including strategic mica, beryl, lithium, and tantalum.

We explored workable deposits of corundum, optical calcite, kyanite, sillimanite, celestite, barite, and block talc as the need for these minerals became acute.

Further exploration for the ores of aluminum added substantial tonnages of bauxite, alunite, and aluminous clays to the country's reserves.

Through intensive research in its experiment stations, demonstration plants, and pilot plants, the Bureau developed processes for utilizing ores from deposits that it explored and from other domestic reserves. Advancements were made in the methods of producing vanadium, manganese, chromium, zinc, lead, aluminum, and the various pegmatites and nonmetallics from ores and materials which often were of low-grade and complex nature. Other achievements of the year included the development of a process for producing titanium, a strong, corrosion-resistant metal; a method for producing magnesia, nickel, chromite, and silica gel from olivine, an abundant material which had defied utilization; and a procedure for obtaining magnesium compounds from dolomite.

Thousands of ore samples were analyzed for prospectors, claim owners, and industries, and a consulting service was maintained to advise those concerned on the feasibility of exploiting doubtful deposits. Cooperative research was conducted with industry. When significant discoveries or advancements were made in any of the Bureau's many fields of experimental work, they were reported at once to war agencies and industries concerned with procurement and production.

As coal shortages became acute, the Bureau made technical advice available to industry on the problems of coal mining—preparation, procurement, storage, and combustion. Coal-mine and coke-oven operators particularly were aided in improving their products. Large sums of money were saved for the Army, Navy, and other Government agencies, by analyzing samples to guide them in awarding contracts for fuel. The Bureau also trained Army personnel in coal sampling at posts throughout the country, and tripled its boiler feed water analyses to protect Army camp boiler plants. A national fuel efficiency program was undertaken to combat waste in the commercial and industrial use of all types of fuel and heat energy.

With military requirements dipping deep into domestic petroleum reserves and discoveries of new oil fields declining, the Bureau mapped out a long-range program of research in the production of synthetic liquid fuels from coal, oil shale, and other materials. This will involve the construction and operation of demonstration plants to provide a blueprint for private industry. Meanwhile the Bureau continued laboratory-scale investigations of the various synthetic fuel-making processes and gained widespread attention as the war rationing of gasoline made American motorists conscious of motor-fuel shortages. One pilot plant for the complete gasification of sub-bituminous coal and lignite was designed, built, and successfully tested in 1944, and another was under construction.

The completion of three new helium plants increased the total to five, enabling the Bureau to meet every demand of the armed forces and to release large quantities of this lightweight, nonburning "miracle gas" to scientific, medical, and industrial consumers. The United States enjoys a world monopoly of helium, but the supply is not inexhaustible. However, an adequate reserve for the future is assured by the Bureau's conservation plan in which helium, extracted from natural gas going to the commercial fuel market, is returned to the original subterranean vaults for storage until it is needed. Official recognition of the Bureau's extraordinary achievements in helium production for war came in January 1944, when the Army-Navy "E" was awarded to the plants at Amarillo and Exell, Tex.

Charged with the seemingly paradoxical tasks of helping supply more oil for war and prolonging the life of the Nation's natural crude-oil deposits, the Bureau achieved both. Research disclosed new sources and improved the quality of ingredients that were needed to increase the production of high-octane fuel for war planes, toluene for explosives, and other petroleum products. At the same time, application of the modern engineering principles of secondary recovery extended the period in which the United States can depend upon petroleum reserves as its main source of liquid fuels. A number of surveys were made of oil field practices and reservoir components, and more than 40 engineering reports were submitted to the Petroleum Administration for War, operators, and others who were concerned with meeting the war needs for special lubricants, fuels, and chemicals.

Wartime shortages of labor and equipment, longer working hours, and the need for greater production called for increased emphasis on the Bureau's health and safety programs in the mineral industries. Safety experts trained thousands of workers in first aid and in mine-rescue and accident-prevention procedures. Approximately 3,000 coal mines in the United States and Alaska had been surveyed for safety conditions and practices, many for the second time, and Federal inspectors reported thousands of improvements that protect life and

property. The effect of these precautions was demonstrated as accident-frequency rates in reinspected operations declined about 6 per cent and as the industry's fatality rate reached the lowest point in coal-mining history. Achieved despite adverse conditions related to the war, these gains foretold greater attainments after victory. The opposition expressed by many operators to the legislation and the early phases of the coal mine inspection program turned to praise and wholehearted cooperation.

Cooperating with the Bureau's wartime plant-security programs, the mineral industries' record was not blemished by a single clear-cut case of sabotage. Under the Federal Explosives Act, the Bureau inspected stores of nonmilitary explosives and licensed the manufacturers, distributors, and users of nonmilitary explosives and their ingredients. The mineral production security program was so effective that it was curtailed after Bureau engineers, trained in the prevention of sabotage and of subversive activities, examined mines, mills, and smelters to suggest suitable precautions.

Thousands of chemical analyses and explosives control tests were made in the Bureau's laboratories, the majority of them for the Army and Navy. To promote safety in the manufacture and handling of explosive and inflammable materials, experiments were conducted to determine the characteristics of military pyrotechnics, explosives, powdered metals and plastics, coal dust, vapors, gases, and liquids. Gas masks and other respiratory devices were tested, and inspections were made to improve hygienic conditions in mines, plants, and some Army Establishments.

Increasing requests from war agencies and industries for factual reports on minerals to guide their programs resulted in a further step-up in the Bureau's statistical services which already had been operating at high speed. The Bureau compiled up-to-date information on such subjects as domestic and foreign production, consumption, requirements, trade, uses, and stocks of mineral commodities. Many special studies were undertaken for the War and Navy Departments, War Production Board, Solid Fuels Administration for War, and Petroleum Administration for War, and many more will be required in the solution of national and international post-war problems.

THE GEOLOGICAL SURVEY

The Geological Survey prepared plans within the fiscal year for two related but distinct programs—one for the investigations and mapping that it should promptly undertake to provide the fundamental information required by the agencies that are now laying out plans for post-war construction and development projects, and the other for the long-range investigative and mapping program that it should undertake after peace returns.

The Geologic Branch has continued to devote itself very largely to studying deposits of minerals and ores that are needed in war, and to estimating the reserves and grades of these materials. Many thousands of deposits have now been examined, and the information obtained constitutes an inventory of the Nation's reserves of metals and minerals which is essential to peacetime industry as well as to the conduct of the war. A number of minerals at first considered critical in the war program are now known to be adequate in quantity, at least for the present, but the accelerated use of minerals to meet the war demands has resulted in a serious depletion of the reserves of many of the more common metals. A wise policy, therefore, demands that the national inventory of mineral reserves be intensified and kept current as new deposits are discovered and older ones become exhausted.

Among the outstanding war projects carried on by the Alaskan Branch was the continued compilation of aeronautical maps and charts for the Army air forces. The method of compilation from air photographs was largely devised by civilian members of its staff. By this trimetrogon method, so named from the camera lenses used, the Survey has furnished planimetric maps covering about 5,300,000 square miles of strategic area widely distributed throughout the world. The Branch has also prepared reconnaissance topographic maps of selected areas totaling more than 500,000 square miles.

Another important project has been the attempt to unify many of the activities concerned with the search for or development of Alaskan oil resources. Although these negotiations are still in progress, the Alaskan Branch has made a start on carrying out its part of such a program by sending five parties into the field to conduct such preliminary work as can be done within the limits of its regular appropriations.

Adequate topographic maps showing woodland coverage and highway facilities are a necessity in the successful waging of any war. The Topographic Branch has bent every effort to the making of such maps of vast areas of strategic importance within the United States and also in Europe and other theaters of war. Special topographic maps were made for Army maneuvers; for the investigation of critical minerals which are indispensable to successful military operations; for coal explorations; and for river utilization and flood control. Of great importance for the defense of our island possessions was the completion of the topographic mapping of Puerto Rico and Vieques.

The importance of water to both war and post-war activities has been emphasized by more than 5,000 requests made of the Geological Survey within the year for special reports on water in relation to problems that have arisen in the construction and operation of military, naval, and industrial establishments and in post-war planning.

These problems have involved the quantity and quality of the surface and ground water that was available or could be made available for use at hundreds of different sites in every State and in the Territories of Alaska and Hawaii. This important public service by the Water Resources Branch has been possible because of its mass of published and unpublished information which has been collected regularly for many years and supplemented by numerous special field investigations. The staff is decentralized, and it operates from about 100 field headquarters. Much of the work was done in cooperation with Federal, State, and municipal officials, who have aided materially in the solving of special problems. Water experts of the Survey have continued to serve with the armed forces, either as officers or civilians, in obtaining water for the Armies in the field.

The Conservation Branch has two principal functions. The first is to make surveys and investigations of the water and mineral resources of the public domain and to apply the results to public-land administration. The second is to supervise operations for the development of power and the production of minerals, including oil, gas, coal, potash, sodium, lead, and zinc, from public lands, Indian lands, and naval petroleum reserves. Additional funds, made available to the Conservation Branch during the year, provided extra assistance and equipment necessary for initiating war-related field investigations and the preparation of reports dealing with power and fuels and with minerals essential to the national war program. This activity, if maintained on the present scale, will reveal new reserves of such resources and will provide engineering information that is essential to the elimination of waste.

THE SOLIDS FUEL ADMINISTRATION FOR WAR

Our work in the Solid Fuels Administration for War helped to strengthen the coal industry for this emergency, but no legislation has been designed specifically to help us to stabilize the industry after victory.

We so regulated the distribution of coal that war industries, first of all, might receive their necessary supplies, and, after them, other consumers were taken care of according to their relative needs. This helped to stabilize war manufacture in coal-burning plants, and to facilitate the operations of railroads and public utilities.

By establishing relative needs for other than production use, and by regulating distribution accordingly, we forestalled widespread suffering among householders.

The distribution of coal was so arranged that we developed and put into effect over-all distribution programs which fully related the anticipated supply to estimated requirements, and the programs were

designed to assure an equitable distribution of all of the coal which can be produced under present conditions.

We helped to maintain maximum production at the mines, striving to retain mine manpower and to increase working hours and the number of days of work in the pits. We helped to furnish additional machinery and equipment and in the development and extension of mines.

All of these measures were carried out with the cooperation of the coal industry and of coal consumers.

The SFAW encountered a coal supply crisis only a few days after its establishment, when the first in a series of widespread mine strikes occurred. These strikes cost an estimated 40,000,000 tons of potential production in 1943. Thereafter, through 1943 and into early 1944, we dealt with a series of major and minor crises caused by coal shortages. While meeting the demands of the day, we enlarged the SFAW staff, formed advisory committees of experienced leaders of the coal industry, and began the development of long-range plans to avert further difficulties.

The programs that are now in effect cover coal distribution from the mine to the industrial plant and to the household consumer, and take into account differences in grades, kinds, and sizes of coal and the varying requirements of consumers. These programs will continue, subject to any modifications which changes in the coal supply may dictate, until March 31, 1945. Then they may be extended if necessary. They allocate scarce hard and soft coals among users in accordance with their needs and essentiality, encourage the use of alternative coals, where available, and spread the supply by limiting the amounts of the scarce coals that domestic consumers may receive. This will necessitate the extensive use of alternative fuels by such consumers and the practice of rigid conservation.

The SFAW was given the added responsibility during the year of distributing equitably the limited supply of coke available for domestic consumption.

A Nation-wide network of industry committees has been established to keep the SFAW informed of conditions in retail distribution and supply in order to avert local emergencies. If unavoidable crises occur, the committees will function to pool the resources of their communities, thus mitigating the distress of individual consumers.

The major production problem has been a growing shortage of manpower in the mines. This has placed a definite limit upon the productive capacity of the Nation's mines. Operators and miners have performed a difficult task in producing coal in spite of handicaps.

Much of the increased production has been in the strip-mined coal from temporary operations, and in low-grade coals which are suitable only for certain industrial uses. However, industrial consumers who are able to utilize these coals have been required to accept them so far

as possible, thus freeing the scarcer coals for use by industries which cannot shift, and for the use of domestic consumers.

Consumption of coal, in view of the production losses during the strikes and the impossibility of increasing production because of manpower shortages, would have been severely curtailed in the fiscal year except for the millions of tons of bituminous coal in consumer storage piles. This supply was accumulated in 1941 and 1942 against apparent emergencies. By compelling users with adequate stocks to draw upon them for part of their current consumption, the SFAW freed large tonnages of newly mined coal for the use of industries with insufficient stock piles and for distribution by retail dealers.

With the production lag in some coals that are most essential to industry and to domestic users, it is evident that the Nation's coal problems are not solved. Nevertheless, a smooth-functioning mechanism now exists to lessen the impact of difficulties and to facilitate the flow of coal for essential uses.

THE COAL MINES ADMINISTRATION

As a result of our work in the Coal Mines Administration the strike-bound coal industry was brought back to full production without our resorting to force. Before the end of the year we were able to return to private possession and control all except two of the Nation's anthracite and bituminous coal mines of which we took possession under your orders when the industry was paralyzed by strikes.

By the time the mines were returned, harmony had been restored between management and labor, firm wage contracts were in effect, bituminous coal production had increased to the largest volume it has ever reached, and anthracite output was at its wartime peak.

Under a Government-mine-workers' contract, which provided for no increase in the basic rate of pay specified in the miners' pre-war contracts with the operators, but which called for substantially increased working time, the men improved their efforts to augment coal output.

This contract served as the model for the operators and miners who, as a result of our intercession, were brought together by mutually acceptable wage contracts within the terms of the national stabilization program.

For years the industry has failed to operate in the absence of a contract between its owners and employees. As rapidly as the new industry contracts were effectuated, we began to return the mines to their private owners, and by June 21, 1944, all of the mining properties had been returned, except the two mines of one bituminous coal company which was engaged in a legal test of the portal-to-portal compensation which was provided for under the industry-mine-workers' agreement.

The Government first took possession of the mines on May 1, 1943. All of the mines that were involved were returned to their owners by

October 12, 1943. On November 1, 1943, possession was taken for the second time.

During the 13 months that the mines were in the possession of the Government, production per man was the highest on record, and the mine fatality rate from November 1943 through May 1944, was the lowest for any comparable period in our mining industry.

We organized the Coal Mines Administration early in July 1943, to administer Government possession of the mines. Its personnel was kept at a minimum by utilizing, in large measure, the trained workers in existing Bureaus of the Department of the Interior. The Coal Mines Administration, having done its work, is now being liquidated.

THE GENERAL LAND OFFICE

In the General Land Office we have worked as hard to fit ourselves for the best post-war land administration as we have worked to make our great contributions to the war program.

One of our big post-war jobs will be the administration of a carefully developed system of stabilized-land settlement in Alaska. Settlement in the Territory has a strong appeal, particularly to those vigorous and adventurous citizens who seek the opportunity to pioneer. We must do our utmost to foster that undertaking, for through such a spirit America has grown great. It is equally essential that the disastrous ghost-town experiences of earlier settler days on the mainland be avoided in the development of Alaska. Plans already laid by the General Land Office for the attainment of that objective can be facilitated by congressional authority to extend to Alaska the requirement that public land, before disposal, must be classified as suited to the use for which it is sought.

Land settlement in the United States by returned service men constitutes another high priority problem. We could assist greatly in its solution by the establishment and maintenance of an inventory of all Federal lands, in order that a fresh determination may be made of the locations of the comparatively few tracts on the public domain which may still be suitable for homesteading.

Increasingly mechanized armies require greater amounts of minerals for war and call for the highest degree of efficacy in our national mineral economy. But we cannot achieve that efficiency without a rejuvenation of our Federal mining laws. Vast areas of public lands, and lands acquired under many Federal laws, constitute a storehouse of essential minerals, yet, under present statutes, no method exists by which the United States may catalog and, in cooperation with private initiative, develop the resources on those lands through leases based on sound principles of conservation. Legislation that would provide for the marshalling our full complement of mineral resources is a necessary adjunct to adequate stockpiling.

The soundness of this Administration's conservation policies was clearly demonstrated by the accomplishments of the General Land Office in the administration of the public domain during the past fiscal period. Although a full realization of the program for maximum benefits to the people from the use of natural resources, particularly minerals, was blocked by opposition to a much-needed revision of the Federal mining laws, there were other distinct gains registered during the year. For example, operations for the 12-month period were featured by the highest bid ever received by the Government for the privilege of drilling for oil on a single acre of Federal land, when \$26,216.21 per acre were offered as a bonus for leased land in the Elk Basin field in Wyoming. Moreover, the cash receipts from the activities of the office were the largest in 20 years, exceeding expenditures for its maintenance at a ratio of \$6.18 to \$1, and producing a total cash return of more than \$14,000,000.

In addition to furnishing minerals for war through the administration of the mining and mineral leasing laws, the office made a greater aggregate contribution of public land and resources for war uses than ever before. More than 15,400,000 acres of the public domain have been made available for training areas, target ranges, and other military uses during the emergency period, and approximately 70,000,000 other acres were set aside to permit the exploration and development of minerals for war. Timber for war uses was furnished from the re-vested Oregon and California railroad grant lands under its jurisdiction. Stability for industries and communities in that region will result from the wider establishment, contemplated for the near future, of economic units for sustained yield forestry operations.

THE OFFICE OF LAND UTILIZATION

In the Office of Land Utilization we placed special emphasis on plans for extending our land conservation and development programs after the war to furnish interim employment, if needed, during the demobilization and reconversion period.

A major forward step in administrative management was taken by the establishment of a Water Resources Committee in the Office of the Secretary, to assemble and disseminate essential information concerning water-development programs involving the Department; to review water-development projects proposed by the bureaus and offices of the Department; and to formulate such recommendations as will assure an all-inclusive departmental water conservation policy.

Although continuing to operate on reduced wartime budgets, the land-conservation programs which are coordinated by this office made satisfactory progress in the protection of resources and of strategic facilities on the public domain during the fiscal year. Forest and range fires were held to low levels. Excellent cooperation on the part

of range users increased the effectiveness of soil and moisture operations. The 11 conscientious objectors' camps operated by the Department continued to give first priority to conservation programs, including fire, insect, and disease control.

THE GRAZING SERVICE

Our post-war plans in the Grazing Service provide for the employment, on a 3-year basis, of 31,000 men on 60,000 projects of 16 major types, including soil, water, and forage improvements, in 200 western counties. This work would aid in the restoration and better use of the Federal range, and would condition these long-neglected lands to contribute their fair share to the local and national economy. Such projects would increase production on the range, and would protect the water and the soil on the public and other lands.

Although primarily concerned with the administration, protection, and development of the grazing and related resources on the 142,000,000 acres of Federal range in the 60 grazing districts in 10 western States, the work of the Grazing Service during the year just closed included many other activities relating to the war and after-war period.

The Grazing Service made available 14,428,919 acres of public land for maneuvers, precision bombing, gunnery ranges, training camps, airfields, and other military purposes. Grazing privileges were issued to 22,562 livestock producers for 10,694,305 head of livestock. Alternating military and grazing uses in large areas enabled range lands to serve two war uses.

Extensive range improvements were postponed to conserve manpower and materials. Access roads of 788 miles were constructed, making a total of 1,570 miles in 2 years to tap 20 types of critical materials in 8 States.

THE FISH AND WILDLIFE SERVICE

Changes in administrative objectives and procedures necessitated by wartime economy surely will carry over into our post-war activities in the Fish and Wildlife Service. It has been necessary, for instance, to give rather close attention to labor problems in the fishery industries. As a result of the benefits obtained, it is planned to establish a labor unit, the operations of which will contribute to the solution of post-war problems in employment and social security.

Methods have changed through an increased adoption of scientific management principles in fish production, whether in the farm ponds that are now being built by the thousands, in the lakes and streams providing important recreational angling, or in the bays and seas which are the source of the greatest commercial yield of fishery products.

A 3-year development program in fish and wildlife conservation is ready to be put into action whenever required. This program will provide employment for thousands of persons and will benefit numerous industries which manufacture the supplies that will be needed.

A record take of fur seals brought returns expected to exceed \$4,500,000, and economic uses of the wildlife refuges yielded an income of \$244,700.

The Fish and Wildlife Service has put boats and buildings to war use, its refuge lands are used on a vast scale for military training and for actual fighting bases, and its personnel cooperates in observing enemy submarines and in guarding against sabotage and subversion.

THE OFFICE OF COORDINATOR OF FISHERIES

We have brought about the accomplishment, to an encouraging degree, of the primary tasks which we undertook in the Office of the Coordinator of Fisheries. This applies to the Nation's war and post-war needs.

With the demand for fishery products greatly increased by the war program, the most essential need was to halt the decline in production which set in early in 1942, and, if possible, to restore the yield to the pre-war level. Through the unceasing and closely coordinated efforts of industry and Government, this aim is now being accomplished. The total yield of fishery products in 1943 was slightly more than 4,000,000,000 pounds, a substantial increase over the 3,700,000,000 pounds landed in 1942, and approximately equivalent to the catch in 1940. While the yield in 1944 cannot be foreseen with accuracy at this point—June 30, 1944—the upward trend appears to be continuing and a total production of approximately 4,300,000,000 pounds is anticipated.

The restoration to the fishing industry of the greater part of its machinery of production is largely responsible for this improvement.

The requisitioning of 700 of the finest fishing boats for the Army and Navy caused a loss in productive capacity amounting to 50 percent or even more in certain fisheries. Restoration of the depleted fleet is proceeding rapidly. Total returns of requisitioned craft now amount to approximately 40 percent of those originally taken; while authorizations for the construction of new vessels totaled 1,010 by June 30. Of these, 661 were scheduled for completion by the middle of 1944. When construction of the authorized craft has been completed the fishing fleet will have regained its full strength and will consist of a larger proportion of new vessels than ever before. Similarly, the situation with respect to the repair and maintenance of vessels and shore plants shows further improvement over last year, while the gear situation is generally satisfactory.

Not all of the wartime problems of the fishing industry have been solved. There are not enough men to operate the vessels, the shortage of captains, mates, and other skilled personnel being especially serious. Labor is critically scarce in many processing plants. Operating programs administered by the coordinator's office are still required in the salmon and pilchard fisheries to obtain the maximum production and the most efficient utilization of the catch. Difficulties of refrigerating, storing, and transporting the products of the fisheries have not yet been satisfactorily resolved.

One of the most significant and gratifying facts, however, is the sound condition of the fishery resource. Because the precepts of wise conservation have been followed even while attempts were being made to increase production, many important commercial species are actually showing signs of an increase in abundance. Instead of being impaired by the heavy demands of war, the fisheries will be in excellent condition for post-war development.

THE NATIONAL PARK SERVICE

In the National Park Service we have contributed toward the Nation's post-war future by holding intact those priceless remnants of the American scene entrusted to our guardianship. Despite the issuance of more than 1,000 authorizations to war agencies for the use of park lands and facilities, there has been but little impairment of park features. They would have been impaired if we had yielded to organized group pressures, without questioning the alleged critical necessity for invading the parks, or if we had not helped to explore alternative courses of action, when the use of resources in the parks was proposed. Credit is due to the representatives of war agencies, military and otherwise, who have realized the value to the Nation of preserving the national parks unimpaired.

The National Park Service during the past year has been subjected to some unwarranted and unjust criticisms by interests that have seen in the war an opportunity to utilize, for their own gain, certain natural resources hitherto denied them because of well-established park policies. These resources include representative areas of virgin forest, the forage available for cattle and sheep in the meadows, water resources, and minerals. Although these do not bulk large in the total economic life of the Nation—the acreage of the Park System is only three-fourths of 1 percent of the land area of the United States—groups that stand to gain thereby have tried to reopen old issues as to exploitation of the parks under the pretext of war needs. These interests represent small, but vociferous, minorities.

Despite a country-wide campaign of misrepresentation, against designating the Jackson Hole as a national monument, I am convinced that the persons who have directed this campaign do not represent

public opinion nationally or in the region concerned. There recently was published in the Congressional Record, by the chairman of the Public Lands Committee of the House of Representatives, a petition signed by more than 100 leading citizens and business people of the Jackson Hole region, asking that this area, rich in scenery, wildlife, and historical interest, be preserved for park and recreational purposes, rather than allow it to go the way of unplanned exploitation.

Although we have stood ready to sacrifice the park spruce for Army aircraft construction, if absolutely necessary, the need was met without destroying the magnificent "rain forests" of Olympic National Park in the State of Washington. It has not been necessary, either, to open the national parks of California to cattle grazing. The situation that confronted the cattle industry in the State during the drought was serious, but the use of the meadows and uplands of the parks in the Sierra Nevada for grazing would have accommodated fewer than one-half of 1 percent of California's approximately 1,400,000 beef cattle, and that only for a brief period. This inconsiderable aid would have been out of proportion to the resultant damage to public properties.

Two important areas were added to the National Park System during the year—the 700,000-acre Big Bend National Park on the Rio Grande in Texas, through the donation of lands by that State, and the home of Franklin D. Roosevelt national historic site.

Since the attack on Pearl Harbor, 4,135,000 men and women in uniform have visited the national parks and allied areas, including scenes of important events in the Nation's history, and, as a result, they have the better appreciated the greatness of America.

THE OFFICE OF INDIAN AFFAIRS

The progress in the Office of Indian Affairs has been better than could have been expected considering the innumerable hampering restrictions that are placed upon our administrative procedures. Administration will be good, in my opinion, to the extent that a competent administrator is left free, within reasonable limits, to apply his energies and his funds as shifts of circumstance require. But the Indian Office is restricted to an uncommon degree in its activities and in the exercise of the Commissioner's judgment by means of limitations which are written into its appropriation bill.

The budget for this office is broken down into about 200 separate appropriations, each hedged with limitations—so much for salary to an Indian school superintendent, for instance, so much for his assistant, so much for drayage, so much for repairs, etc., and no matter how little money may be needed for these items nor how much may be required for a purpose that was unforeseeable when the budget was submitted, funds may not be used to defray any expenses for which they were not specifically appropriated. There is a specific appro-

priation for each of our many Indian boarding schools and unforeseeable circumstances may cut the cost of conducting these and increase the cost of conducting another, still we are prohibited by legislation from diverting more than 10 percent of an appropriation from one school to another.

Some of the restrictions strike at the very base of our fundamental policies—for example, bills to issue patents in fee and to remove restrictions on the sale of specific tracts of Indian lands. The enactment of such measures has the effect of removing our authority to protect the Indians' interests in the sale of their lands. Such bills are introduced ordinarily after the Office of Indian Affairs has determined that a proposed sale would not be in the best interest of the Indian who proposes to sell. More than 20 such bills were introduced before the Seventy-eighth Congress. Despite such limitations on restrictions the Office of Indian Affairs has accomplished much during the fiscal year.

Indians, in cooperation with field employees of the Office of Indian Affairs, began work on proposals for post-war programs to meet the needs of various reservations. Sixty-four detailed proposals dealing with the problems of 120 tribes, have been submitted, and these are being carefully analyzed. When approved in their final form they will point the way to economic self-sufficiency and integration into the national life.

Increased interest in education on the part of Indians was evidenced, and a number of tribal councils passed compulsory education ordinances and enforced others that had been neglected. Indian communities have taken an active part in planning school programs. Many throughout the country have requested that Indian Service schools be equipped for the training of home-coming soldiers who may wish to take advantage of the opportunities that are offered by the Servicemen's Readjustment Act. Plans are being made to meet these requests.

The contribution of Indians to the prosecution of the war has been most remarkable. On the first of April, 21,756 had joined the armed forces and were serving with conspicuous gallantry on all fronts. Indians have won all decorations, including the Congressional Medal of Honor and the Croix de Guerre.

Approximately 15,000 Indians are regularly employed in war industries, and in addition, 10,000 men, women, and children have left their homes for varying periods to work on farms and ranches.

Notwithstanding the great exodus from reservations, the total value of all Indian agricultural products last year was more than \$15,000,000, nearly \$2,000,000 more than in the fiscal year 1943. The production of food by the Indian schools was 50 percent greater than in the fiscal year. Fifty-eight thousand gallons of fruits and vegetables were

canned and 10 tons were dehydrated. In addition, 17,000 tons of stock feed were raised.

At the end of the year Indians owned 1,500,000 head of livestock—90,000 more than they owned in the fiscal year 1943.

It is estimated that war bond sales to Indians had reached a total of \$50,000,000 by the end of June.

The rebuilding of the Indian landed estate has continued, and approximately 700,000 acres were added within the United States proper. In Alaska, 6 new reservations, with a total of approximately 13,000 acres, were established, and proposals for 16 additional reserves, comprising nearly 4,000,000 acres, are under consideration.

The democratic approach to the solution of Indian problems has been emphasized during the year. On a number of reservations Indians have organized health councils for the purpose of combating communicable diseases, and these organizations are functioning with enthusiasm for the task. Further progress was made in solving the difficult problems of fractionated land ownership through inheritance. The Rosebud Tribal Land Enterprise is the latest organization to attack the problem.

Indian arts and crafts have not languished, despite the fact that many young craftsmen have left home. In many cases there has been an increase in production and sales, owing to the sponsorship of co-operative producing and distributing centers. Plans have been made for an expansion of craft activities after the war.

THE DIVISION OF TERRITORIES AND ISLAND POSSESSIONS

In the Division of Territories and Island Possessions we have been occupied with the economic and social adjustments in our offshore areas which are becoming more pressing as the end of the war approaches.

The key positions held by Alaska, Hawaii, and Puerto Rico in international travel and as way stations between the world's greatest production centers and the world's greatest markets have brought them into sharp focus and emphasized the urgency for preparing them for their post-war roles.

Owing to progressive reductions in its appropriations for personnel, however, the Division has been seriously hampered in trying to perform its duties effectively. If the Department is to be charged with responsibility for the territories we must be provided with funds that will be adequate for the purpose.

The importance of Alaska is universally recognized. Hundreds of letters from service men, indicating their interest in establishing themselves in Alaska after the war, have dramatized the need for a

well-integrated program of settlement. The Territory remained a "combat area" throughout the year, although the last Japanese were ejected last summer. Health and welfare problems that have been aggravated by war conditions continued to be serious. The Division has worked and will continue to work closely with other bureaus and Departments on these problems and on development programs for the Territory.

The Alaska Railroad for the second successive year has exceeded all previous records in its volume of freight and in passenger traffic. The manpower shortage has presented an acute problem, but despite this handicap, the railroad has continued its improvement program. To meet wartime demands much additional equipment and rolling stock were purchased, most of which was second-hand, due to immediate necessity which would not permit delays incident to the securing of new equipment.

The relaxation of military rule in Hawaii has been an important factor in relieving tension. Many conferences were held with the War Department looking to the termination of martial law, while maintaining such restrictions on civilian activities as may be necessary in view of the importance of Hawaii as an offensive base. Civilian shipping requirements, housing, and public health have had the attention of the Division.

Political advances in territorial areas should keep pace with the aspirations of the territorial people and with their skill in political self-management. During the past year, the concerted desire of the people of Puerto Rico for greater home-rule, expressed there by groups of every political shade, found response in your declaration that the Organic Act of Puerto Rico should be revised so that it would include the right of the people to elect their own governor, and in your appointment of four able and distinguished Puerto Ricans and four continentals, of whom I had the honor to be one, to draft recommendations for such action. The people of the island have the skill and ability to manage their local affairs. I believe that the enactment into law of the recommendations made by the advisory committee which you appointed would give substance to this Nation's declared policies, and that the Puerto Rican people would use this law to strengthen democratic self-government.

At the same time there has been in the island an upsurge of hope and an energetic striving among these people to cure the severe economic dislocations. Some parts of the program which they are executing may not work. They may find it necessary to discard certain features. This must certainly be a period of trial and error, but I believe that there will develop a measure of economic improvement which will at least give the masses of people some hope of a better standard of living.

Steady progress is being made by the Government of Puerto Rico in the introduction of new industries to supplement the island's agricultural economy.

The shipping situation has continued to improve so that food supplies, which reached a desperate state of depletion both in Puerto Rico and the Virgin Islands during the German submarine campaign, are now ample. Through the coordinated efforts of the Division of Territories of this Department, the Office of Distribution and the War Shipping Administration, distribution of the necessities of life throughout the island at stabilized prices has been maintained. It has been possible to return the responsibility for supplying all except a few basic articles to former importers, and it is hoped that the Government may soon be able to withdraw entirely.

An increase of approximately 178 percent in income taxes in the Virgin Islands materially improved the condition of the municipalities' treasuries. The Selective Service and Training Act of 1940 was applied for the first time to the Virgin Islands, and at the close of the fiscal year there were 3,660 registrants between the ages of 18 and 44 in St. Thomas and St. Croix. The Islands were handicapped by the elimination of the Federal appropriation for the position of Government Secretary. This, combined with the frequent absences of the Governor, whose duties by law devolve upon the Government Secretary, threw a very heavy burden on the small administrative staff.

In conformity with your letter of instructions of September 16, 1942, the Department has been engaged in an intensive study of the problems with which we will be faced in the Philippines after reoccupation. There is every reason to look forward to driving the enemy out of the Islands in the not too distant future, and when that time comes the loyalty of the great mass of people encourages the hope that a sound solution of their difficult problem will be found.

THE WAR RELOCATION AUTHORITY

On February 16, 1943, the War Relocation Authority was transferred to the Department of the Interior. This agency was created to assume responsibility for 110,000 persons of Japanese ancestry who had been evacuated from the West coast in the spring of 1942, and to resolve other difficulties that resulted from evacuating the Japanese from the coast.

Two major accomplishments have resulted from our work in this agency. We have segregated from the principal population of the relocation centers those persons who have declared a preference for the Japanese way of life, or who are not considered suitable for resettlement in outside communities. And we have developed an effective

well-integrated program of settlement. The Territory remained a "combat area" throughout the year, although the last Japanese were ejected last summer. Health and welfare problems that have been aggravated by war conditions continued to be serious. The Division has worked and will continue to work closely with other bureaus and Departments on these problems and on development programs for the Territory.

The Alaska Railroad for the second successive year has exceeded all previous records in its volume of freight and in passenger traffic. The manpower shortage has presented an acute problem, but despite this handicap, the railroad has continued its improvement program. To meet wartime demands much additional equipment and rolling stock were purchased, most of which was second-hand, due to immediate necessity which would not permit delays incident to the securing of new equipment.

The relaxation of military rule in Hawaii has been an important factor in relieving tension. Many conferences were held with the War Department looking to the termination of martial law, while maintaining such restrictions on civilian activities as may be necessary in view of the importance of Hawaii as an offensive base. There is every reason to look forward to driving the enemy out of the Islands in the not too distant future, and when that time comes the loyalty of the great mass of people encourages the hope that a sound solution of their difficult problem will be found.

THE WAR RELOCATION AUTHORITY

On February 16, 1943, the War Relocation Authority was transferred to the Department of the Interior. This agency was created to assume responsibility for 110,000 persons of Japanese ancestry who had been evacuated from the West coast in the spring of 1942, and to resolve other difficulties that resulted from evacuating the Japanese from the coast.

Two major accomplishments have resulted from our work in this agency. We have segregated from the principal population of the relocation centers those persons who have declared a preference for the Japanese way of life, or who are not considered suitable for resettlement in outside communities. And we have developed an effective

program for returning the loyal and law-abiding majority of evacuees to the mainstream of American life.

At the close of the fiscal year, 18,672 persons who are not suitable for resettlement were residing in the Tule Lake segregation center in northern California. Segregation, however, had not proved satisfactory as a permanent measure. Among the segregants were approximately 3,300 children under 17 years of age and an additional 1,800 persons who were placed in the center solely to avoid disrupting family units. Careful studies of the segregants indicate that only a few of them are disloyal to the United States. Many older people sought to be segregated simply because segregation seemed to offer them a haven for the duration of the war. Others went to the center in protest against the evacuation and the restrictions that were placed upon them. They interpreted these restrictions as evidence of unfair discrimination. It is extremely doubtful that deportation after the war will dispose of the Tule Lake problem.

The conversion of Tule Lake into a segregation center left nine centers populated principally by individuals and families that are eligible for relocation. At the end of the year the progress of relocation had enabled us to close one of them—the Jerome center in southeastern Arkansas. A total of 16,846 persons departed from the centers on indefinite leave during the 12-month period, making a grand total of 23,693 to that date. Mainly, they were younger people without family responsibilities, though an encouraging increase in the relocation of older people and family groups occurred toward the end of the year.

The relocation of those who remain in the centers becomes more difficult as the younger people leave. Every departure increases the percentage among the residue of evacuees who, because of age, infirmities, unfamiliarity with English, and indigency, are less amenable to rehabilitation in strange environments. Many evacuees have developed a reluctance to leave the comparative security of the centers for the uncertainties of life outside. This reluctance is hard to combat, but we are working constantly to overcome it.

The departure of the younger, more able-bodied evacuees also has augmented the difficulty of recruiting evacuee-workers to maintain essential services at the centers. No essential service has been allowed to lapse, however, and no phase of the relocation program has been abated to hold workers in the centers. The full force of the War Relocation Authority has been exerted to relocate the evacuees as rapidly as possible.

On June 9, the War Relocation Authority was assigned to take charge of an emergency shelter that was to be established at Fort Ontario, N. Y., for approximately 1,000 European war refugees. Plans to receive the refugees were under way at the end of the fiscal year.

THE SOLICITOR'S OFFICE

Through the concerted work of the Solicitor's Office and the legal divisions of the bureaus and offices under the supervision of the Solicitor, the attorneys of the Department have done much during the past year to advance the Department's post-war programs, to support the fighting of the war, and to protect and conserve the Nation's resources for their best long-term use.

Since most of the Department's post-war programs require legislative authority, the Solicitor's Office and the legal divisions of the interested bureaus proceeded to put these programs into legislative form. Some of the bills were enacted. The most important legislative proposals provided for the opening up of greater homestead and industrial opportunities to veterans and other persons in the territories and in the continental United States through reclamation and power developments. Another important bill, prepared in anticipation of post-war liquidation problems, provided for the administration of surplus Federally owned real property.

Toward the winning of the war the attorneys of the Department originated the legal mechanisms for the equitable and beneficial allocation of supplies of coal and other solid fuels and of fishery resources. They prepared the necessary documents for the operation of the coal mines and for the termination of Government possession, undertaking extensive research to protect the Government. They drafted regulations for the storing, handling, and transporting of explosives and their ingredients by civilians, and for the operation of relocation camps for citizens and aliens of Japanese ancestry and for other persons who had been removed from military areas. They reviewed leases, permits, and other agreements whereby agricultural, grazing, timber, and mineral resources of the Nation were made available for military uses or for the greater production of food and other necessities of war. They gave attention to the legal problems that were involved in the application, under martial law, of military orders to civilians in Hawaii, and engaged in numerous conferences on such problems with the War Department and the Department of Justice. They also drafted contracts for the operation of experimental metallurgic laboratories.

In the field of a long-term conservation of resources, the attorneys helped to prepare Public Law 273, establishing the principle of sustained-yield to forest management on Federal lands, and Public Law 106, strengthening the Alaska game and fish protection law. They protected title to certain public lands that were subjected to invalid claims and passed upon the title to new acquisitions of grazing, timber, and park lands. They maintained Indian property rights on the Pyramid Lake and Allegheny Reservations through successful litigation and undertook the protection of Indian lands in Alaska through the

study of Indian land claims. They also devoted increased energy to the protection of the civil rights of various groups toward which the Federal Government has assumed special responsibilities, notably the inhabitants of Hawaii, Puerto Rico, and other Territories and possessions, as well as Indians and evacuees of Japanese descent.

To stimulate the interest of the Department's attorneys in the opportunities of Government service and in the possibilities for improvement in standards of work, the Solicitor put into effect a strict application of the Department's advancement from within policy and undertook the establishment of an in-service training program.

CONCLUSION

From all of the foregoing I conclude that we have so far advanced conservation that nearly every individual on this continent may improve his lot if only we have the will to make our gains serve their logical purpose—the advancement of human welfare. The consolidation within a brief time of gains that have been long in the making, is not new in our history. Steam propulsion spent a century in the toy and novelty stage, then developed enough in a decade to reshuffle our industrial processes. Electricity followed the same course to the point at which it revolutionized domestic economy. So did automotive transportation. The advent of hydroelectricity, so developed that it can revolutionize heavy industry, and accompanied by equally developed supporting facilities, serves mainly to introduce a new generation to an historic occurrence.

There are some differences, of course. One difference appears especially important to me. All of the other great additions to the world's power have reached the world-changing stage under divided ownership. Public will, no matter how united, could not have demanded the prompt development and the equitable use of the potential power in steam or in the internal combustion engine. The development of potential power usually has been delayed while individuals have warred over who should profit when the development occurred. The consumers eventually financed such wars.

The final results of conservation that I have referred to as power—the product of our dams, our irrigation projects and other developments—is the first great accumulation of new energy that ever belonged to all of us. In that there is a huge advantage and a corresponding responsibility. The advantage is that we can put our new acquisition of power to work for all of us, and do it promptly. The responsibility is that we must do these things for ourselves.

Sincerely yours,

Harold L. Ickes

Secretary of the Interior.

Bureau of Reclamation

HARRY W BASHORE, Commissioner¹

PREPARATION to safeguard the western economy in the critical postwar transition period was emphasized in activities of the Bureau of Reclamation in the fiscal year 1944.

Reclamation developments have greatly increased food and power production for war, but today the Bureau is making ready to enable the people to utilize western water and land resources in a great peacetime expansion. Plans call for completion of irrigation and multiple-purpose projects now authorized, involving costs of more than three-quarters of a billion dollars, and for construction of 236 potential projects. These were described in an inventory placed before the Senate Committee on Postwar Economic Policy and Planning on June 6, 1944.

This presentation emphasized the fact that authority for projects which would not be entirely self-liquidating would have to stem from Congress, and that funds also would have to be voted before detailed plans could be completed.

In anticipation of approaching industrial reconversion, the Bureau is getting ready for quick employment of hundreds of thousands of demobilized servicemen and civilian war workers. Equally important is the objective of permanent homes for veterans and others on irrigated farms in 17 Western States—homes which will assure large new markets for products of eastern as well as western farms, and for factories in all parts of the Nation—a true expansion of our western frontier.

Planning was carried forward simultaneously with Bureau activities to increase food production and hydroelectric output to drive the wheels of a war industry which sprang up with incredible rapid-

¹ Mr. Bashore took office as Commissioner of Reclamation on August 3, 1943, having been appointed by President Roosevelt. From May 27, 1939, until his appointment, he had been Assistant Commissioner of Reclamation. William E. Warne, formerly Chief of Information of the Bureau, was appointed Assistant Commissioner by the Secretary of the Interior on August 3, 1943, and entered on his duties on August 9.

2 • *Report of the Secretary of the Interior*

ity to pour forth aluminum, airplanes, warships, ammunition, which without this power would have limped. Throughout the planning, there was intense awareness of the difficulties all will face—particularly the West—in making the adjustment to peace.

But as a result of this foresight, it will be possible to put the demobilized men at project sites in the Western States almost as soon as peace comes, provided enabling legislation is passed; and the benefits will spread to industries and transportation systems in the 31 States as soon as orders are placed for equipment and supplies. It will be needed in the construction of the Bureau's projects and in the creation of farms that will be established upon them.

For the discharged men who are qualified by previous training and experience to undertake irrigated farming, 135,000 new farms will be made available. In the wake of the new development would rise new cities and towns, having a population equal to that of the rural areas. Markets and production centers throughout the Nation would be stimulated by the enlarged western purchasing power.

Toward the integration of western industry and agriculture, the program must be developed together if the region is to reach full economic maturity, the multiple-purpose projects in the program would furnish large blocks of new low-cost electric power. Revenues from the sale of the new energy would pay for a sizable portion of the project construction costs which have been estimated, on the basis of 1940 prices, at nearly 3 billion dollars.

Reclamation construction is ideal as a postwar undertaking because the volume and speed of the construction can be readily geared to the volume of employment and settlement needs. And what is also important, the development and utilization of unused water supplies for the production of hydroelectric power and expansion of irrigation will permanently enrich the West.

Continued study of the land and water resources of the West during times of peace and throughout the war, have made it possible for the Bureau to present its concrete postwar blueprint. From the beginning of the war, it has advanced, as rapidly as emergency conditions permitted, investigations of more than 200 individual projects and of approximately 70 river basins and subbasins.

The Bureau made notable progress in advancing postwar planning the year without relaxing its war activities in the fields of power and food production. Outstanding records were made in both.

Reclamation generators delivered nearly 14½ billion kilowatt-hours of electric power, about 52 percent more than in the preceding fiscal year. The increase since the fiscal year ending a few months before Pearl Harbor is 400 percent. More than 90 percent of the new power made available during war was consumed by war industries.

aluminum and magnesium plants, airplane factories, shipyards, and munitions plants. The 3-year increase in production was about five or six times the percentage of increase in aggregate production recorded over the same period by all plants in the United States.

The expansion in output resulted from a highly accelerated program of hydro power installations. During the war a million and a third kilowatts of new installed capacity were added—about half a million this year—to bring the Reclamation installation to about 2,360,000 kilowatts. The Bureau's war power contribution constitutes 84 percent of the total new capacity made available in the 11 Far Western States since 1941.

No less spectacular were the achievements of farmers on Bureau projects in production of vital war food crops. The more than 4 million acres served in 15 Western States during the calendar year of 1943 produced 52 percent more potatoes than in 1942 and 23 percent more beans. The expansion in these basic food crops is indicative of the manner in which Reclamation helped forestall threatening food shortages.

Throughout the fiscal year the Bureau, in recognition of the great need for increased agricultural production, sought to construct new facilities to bring under cultivation additional areas of arid and semi-arid lands and to provide supplemental water for farms on which crop production was being reduced by an inadequate supply of water. Since the fall of 1942, when the Bureau's ability to expand irrigation was limited by diversion of critical materials to other war uses, it has requested the War Production Board to clear many projects on which food production could be expanded. On June 30, 1944, this agency, on recommendation of the War Food Administration, had approved construction of projects on which irrigation service is being extended to 1,265,782 acres.

Another significant Reclamation wartime service was the provision of municipal and industrial water to major war plants and cities and towns which were important in war activity. Municipal areas of 3 million population, including Los Angeles, depend on Bureau projects for supplemental supplies.

PEACETIME CONSERVATION PAYS WAR DIVIDEND

The wartime benefits of Federal Reclamation are the result of 42 years of activity by the Bureau of Reclamation in the field of land and water conservation in the West.

Under the Reclamation Act of 1902, the Bureau has put into operation, or has under construction or authorized, in the 17 States west of or bisected by the 100th Meridian, 78 irrigation and multiple-purpose projects. Fifty-two of these are producing food supplies, electric

2. *Report of the Secretary of the Interior*

ity to pour forth aluminum, airplanes, warships, ammunition, and which without this power would have limped. Throughout this planning, there was intense awareness of the difficulties all will face—but particularly the West—in making the adjustment to peace.

But as a result of this foresight, it will be possible to put to work demobilized men at project sites in the Western States almost as soon as peace comes, provided enabling legislation is passed; and the benefits will spread to industries and transportation systems in the other 31 States as soon as orders are placed for equipment and supplies that will be needed in the construction of the Bureau's projects and in the creation of farms that will be established upon them.

For the discharged men who are qualified by previous training and experience to undertake irrigated farming, 135,000 new farms ultimately would be made available. In the wake of the new development would rise new cities and towns, having a population equal to that of the rural areas. Markets and production centers throughout the Nation would be stimulated by the enlarged western purchasing power.

Toward the integration of western industry and agriculture, which must be developed together if the region is to reach full economic maturity, the multiple-purpose projects in the program would offer large blocks of new low-cost electric power. Revenues from the sale of the new energy would pay for a sizable portion of the project construction costs which have been estimated, on the basis of 1940 prices, at nearly 3 billion dollars.

Reclamation construction is ideal as a postwar undertaking because the volume and speed of the construction can be readily geared to the volume of employment and settlement needs. And what is doubly important, the development and utilization of unused water supplies for the production of hydroelectric power and expansion of irrigation will permanently enrich the West.

Continued study of the land and water resources of the West during times of peace and throughout the war, have made it possible for the Bureau to present its concrete postwar blueprint. From the beginning of the war, it has advanced, as rapidly as emergency conditions permitted, investigations of more than 200 individual projects, and of approximately 70 river basins and subbasins.

The Bureau made notable progress in advancing postwar plans during the year without relaxing its war activities in the fields of power and food production. Outstanding records were made in both.

Reclamation generators delivered nearly 14½ billion kilowatt-hours of electric power, about 52 percent more than in the preceding fiscal year. The increase since the fiscal year ending a few months before Pearl Harbor is 400 percent. More than 90 percent of the new energy made available during war was consumed by war industries—alu-

minum and magnesium plants, airplane factories, shipyards, and munitions plants. The 3-year increase in production was about five or six times the percentage of increase in aggregate production recorded over the same period by all plants in the United States.

The expansion in output resulted from a highly accelerated program of hydro power installations. During the war a million and a third kilowatts of new installed capacity were added—about half a million this year—to bring the Reclamation installation to about 2,360,000 kilowatts. The Bureau's war power contribution constitutes 84 percent of the total new capacity made available in the 11 Far Western States since 1941.

No less spectacular were the achievements of farmers on Bureau projects in production of vital war food crops. The more than 4 million acres served in 15 Western States during the calendar year of 1943 produced 52 percent more potatoes than in 1942 and 23 percent more beans. The expansion in these basic food crops is indicative of the manner in which Reclamation helped forestall threatening food shortages.

Throughout the fiscal year the Bureau, in recognition of the great need for increased agricultural production, sought to construct new facilities to bring under cultivation additional areas of arid and semi-arid lands and to provide supplemental water for farms on which crop production was being reduced by an inadequate supply of water. Since the fall of 1942, when the Bureau's ability to expand irrigation was limited by diversion of critical materials to other war uses, it has requested the War Production Board to clear many projects on which food production could be expanded. On June 30, 1944, this agency, on recommendation of the War Food Administration, had approved construction of projects on which irrigation service is being extended to 1,265,782 acres.

Another significant Reclamation wartime service was the provision of municipal and industrial water to major war plants and cities and towns which were important in war activity. Municipal areas of 3 million population, including Los Angeles, depend on Bureau projects for supplemental supplies.

PEACETIME CONSERVATION PAYS WAR DIVIDEND

The wartime benefits of Federal Reclamation are the result of 42 years of activity by the Bureau of Reclamation in the field of land and water conservation in the West.

Under the Reclamation Act of 1902, the Bureau has put into operation, or has under construction or authorized, in the 17 States west of or bisected by the 100th Meridian, 78 irrigation and multiple-purpose projects. Fifty-two of these are producing food supplies, electric

energy, and furnishing municipal-industrial water. On several operating projects important features remain to be completed. On 9 projects that have been authorized, work has been deferred because of the war.

In the area to which the Bureau's activities are confined the rainfall is inadequate to support agriculture, and conservation of water for irrigation is essential for the maintenance of civilization. The need for low-cost power for irrigation pumping, industries, and other uses has given added emphasis to the importance of double and triple use of limited water resources. The Reclamation developments also provide, in addition to benefits mentioned earlier, flood control, river regulation, repulsion of salt water encroachment and reduction of clogging silt deposits. They aid fish propagation, and create recreational areas and waterfowl and wildlife refuges.

Nearly 5 million persons live in areas in which Bureau of Reclamation systems are operated. About 3½ million persons benefit from power and domestic water, and 1,257,395 live on the 91,120 farms or in cities and towns on Federal irrigation projects. These developments support 338 towns, 1,207 schools, 1,514 churches, and 137 banks (with deposits totaling half a billion dollars) (see table 3). When the construction program now authorized is completed, the various Bureau services will be extended to areas in which reside more than 10 million persons.

The Federal investment in Reclamation developments at the end of the year totaled \$930,000,000. (See table 5, p. 34.) More than 95 percent of the cost is reimbursable under Reclamation law. The remaining 5 percent is allocated to flood control, aid to navigation, and non-reimbursable labor costs.

POSTWAR INVENTORY COMPLETED

Mindful of the Secretary's words—"in time of war we must prepare for peace"—the Bureau laid a sizable portion of the foundation for a stabilized peacetime western economy, warped out of proportion by the dislocations of war.

Near the end of the fiscal year, it completed for the Senate Committee on Postwar Economic Policy and Planning an inventory of irrigation and multiple-purpose projects in the West, which could be included in a postwar public works program to provide employment for discharged veterans and war workers, and make available to those who are qualified, livelihoods on irrigated farms.

In the program are 40 projects already authorized for construction, and about 200 under study. On many of the projects authorized, work is in progress to advance the Bureau's war food and war power programs. Construction on others has been halted or deferred because of the war.

Carried out in full, the contemplated program would furnish employment equivalent to $1\frac{1}{4}$ million men working 1 year, and create an estimated 135,000 new farms. In addition, it would bring greater security to 150,000 additional families, now handicapped by inadequate water supplies which do not permit maximum crop production.

The need for postwar employment and settlement opportunities was indicated to the Bureau in a report by labor experts, which stated that $14\frac{1}{2}$ million persons will be demobilized from the armed forces and war plants. About 3 million of those who will face reemployment problems live in the 17 Western States, and, what is of prime importance to the irrigation program, some 265,000 of this number will be equipped by previous training and experience to undertake irrigated farming.

While the proposed construction would be centered in the western half of the country, 56 percent of the employment—the equivalent of 698,000 men working for a year—would be provided in the mines, mills, and factories of the Midwest, East, and South. The remaining 44 percent, or 553,000 men, would be employed at the sites of construction.

The effectiveness of the Reclamation construction as a shock absorber in the postwar reconversion is enhanced by the fact that it permits a "quick get-a-way". Provided with funds and manpower to complete field investigations and preconstruction work, the Bureau could put more than 300,000 men to work the first year. A peak employment of 400,000 could be reached in the second year.

From the long-term point of view, the inventory is an important milestone toward the expansion of western irrigated agriculture in which lies the basic hope of the region for increased growth and prosperity. The dry-land farming potentialities of the West are virtually exhausted, but water is available for the irrigation of 22 million additional acres of land, approximately the acreage now served. The projects in the inventory would extend irrigation service to a third of the new area—6,705,000 acres—and, in addition, furnish supplemental water for 9,364,000 acres now inadequately watered. Construction of irrigation features on authorized projects alone would create 70,000 new farms and overcome the water deficiency of 100,000 existing farms.

The growing need for added agricultural production in the West is known to all who have analyzed the western economy. The area is becoming increasingly deficient in crop production to meet its own requirements. Expansion in cultivated acreage has not kept pace with population increases. While the number of people living in the Far Western States has increased 60 percent from 1920 to 1940, the irrigated acreage has been expanded but 10 percent.

Integrated industrial and agricultural development is one of the basic prerequisites for orderly economic growth of the West. The same reservoirs which will serve irrigation could provide 1,765,000

kilowatts of new power for industrial use, if the Bureau increased its installations, and 2,579,000 kilowatts of firm power capacity on projects under study. Through revenues derived from the sale of this energy, projects not otherwise economically feasible, can be made sound.

The full development of the new farms and the new communities will increase the purchasing power of the West for products manufactured elsewhere by 1¼ billion dollars, at 1940 prices. The estimated construction cost of the projects in the inventory, on the basis of pre-war prices, is \$2,952,393,000. About \$793,000,000 would be required to construct irrigation features on projects already authorized. The construction of most of the 196 potential projects included in the list would require special legislation by Congress. The inventory may be changed as basin surveys are completed, with additional projects added or substitutions made for those now included.

WAR POWER EXPANSION SPECTACULAR

The greatest expansion of electric power generating facilities ever made by a single agency in a single year was the wartime record established by the Bureau of Reclamation in fiscal year 1944 to meet emergency industrial demands. More than half a million kilowatts of hydro power were added in 31 plants on Reclamation projects in 12 Western States. The increase surpassed by about 55,000 kilowatts the additions made during the previous fiscal year, and by about 100,000 kilowatts, the capacity added in fiscal year 1942.

The new facilities, whose output was almost wholly consumed by airplane factories, aluminum and magnesium plants, shipyards, and other industries that made fighting equipment, brings to nearly 1,400,000 kilowatts the capacity made available since July 1, 1941—a few months before Pearl Harbor. Additional installations proposed by the Bureau, aggregating 865,000 kilowatts, were halted by the War Production Board in the fall of 1942 to conserve critical materials for other war uses. The present Reclamation installation totals about 2,360,000 kilowatts. When all generators on existing projects and on those authorized are placed into operation the capacity will be 4,863,075 kilowatts.

The rapid enlargement of power facilities on Bureau projects was the result of farsighted construction, in time of peace, of multiple-purpose projects designed to meet current and potential industrial and agricultural requirements of the growing West. On these projects, stored water serves both irrigation and power generation.

The output of Reclamation generators paralleled the great gain in capacity. During the fiscal year the plants produced 14½ billion kilowatt hours, highest on record. This was an increase of more than 50 percent over the preceding period.

The new power developments during the fiscal year were confined to three projects. Early in the year the Bureau began transmitting power from Fort Peck Dam (Montana), constructed by the War Department. At Grand Coulee, three of the world's largest hydroelectric generators, each rated at more than 100,000 kilowatts, were put into operation. At the end of the fiscal period, two units, each of 75,000-kilowatt capacity, began service at Shasta Dam of the Central Valley project (California).

The immense blocks of Reclamation power made available in the West, particularly on the Pacific coast, have made possible its record-breaking increase of industrial production. Energy from Boulder Dam supplies the great aircraft plants in the Los Angeles area, the largest magnesium plant in the world near Boulder City, Nev., and other basic war industries, while power produced at Grand Coulee serves a half dozen large aluminum plants, the biggest carbide plant west of the Mississippi, large shipyards, and many other plants.

Gross revenues from the sale of electric power produced in plants operated by the Bureau reached an all-time high during the year of 1944, \$18,992,000. This was a \$4,438,000 increase over fiscal year 1943. Production of power, while regarded as incidental to the Bureau's major function—irrigation of arid and semiarid land—is highly important as a source of revenue for reimbursing the United States for the cost of Reclamation construction. Power will repay half the investment of the Reclamation program as outlined at the beginning of the war.

Boulder Dam's gross revenues are the largest of all Bureau plants. In its 7 years of operation, this development has returned to the United States Treasury \$25,200,000 in net revenues, and in addition, has paid the states of Arizona and Nevada, \$4,200,000, and the Colorado River development fund, through which potential projects in the Colorado River Basin are investigated, \$3,500,000.

Preparations for the sale and transmission to war industries of the output of two 75,000-kilowatt generators at Shasta Dam of the Central Valley project (California), were completed during the year. In September 1943, a wartime contract, guaranteeing the United States an annual payment of \$2,775,000 after January 1, 1945, was made with the Pacific Gas & Electric Co. The 97-mile Government transmission line over which the energy will be delivered to company facilities at Oroville was completed in July 1944.

RECLAMATION FOOD PRODUCTION AT NEW HIGH

Like their sons on the fighting fronts, reclamation farmers, through record-breaking increases in vital crops, brought the Allies closer to victory during the calendar year of 1943.

8 • *Report of the Secretary of the Interior*

Toward meeting emergency food requirements, they increased potato production to 64,044,814 bushels, 52 percent greater than the 1942 aggregate yield, and bean production to 4,175,797 bushels, an increase of 23 percent over the preceding year. The 3,507,520 tons of alfalfa produced, vital as a winter feed for beef and dairy herds, was at a new high. These three critical war food crops were grown on 36.4 percent of the total acreage in cultivation.

The expansion was due both to the concentration of farmers on more important war crops, and to the increases in irrigated areas resulting from enlarged farm activity and from additional lands provided by the Bureau under the war food program. The irrigated area was increased to 4,055,329 acres, highest on record. It is expected that the total 1944 agricultural production on Bureau developments will be brought to an even higher level than that attained in 1943.

From the day—soon after Pearl Harbor—when the Secretary of Agriculture called for “the greatest production in the history of American agriculture” the Bureau has been seeking to extend irrigation systems to bring additional acreages under cultivation and to supply areas suffering with water shortages with a supplementary supply.

The Bureau prepared several accelerated construction programs (in the annual report for fiscal year 1943), listing the projects on which new areas could be served promptly, the amount of critical materials required in the construction, the year crop production could be expected, and other pertinent factors. The detailed information was presented to the War Food Administration, which has the war-time function of evaluating the potential food yield against the amount of strategic materials required, and of recommending clearance of projects to the War Production Board.

The Bureau's activities resulted in approval being given to construct irrigation facilities on 25 projects, which are bringing into cultivation 243,657 acres of new land and providing a supplementary supply for 1,022,125 acres. All clearances were granted in the 5-year except those for Friant Dam and Madera Canal of the Central Valley project (California), facilities on the Gila project (Arizona) to protect an air base from dust storms, and Scofield Dam (Utah) which would provide both flood control and irrigation service.

The projects cleared were:

State	Project	Acreage to be benefited	
		New lands	Supplemental water
	<i>Regular Reclamation Projects</i>		
Arizona	Gila	8,500	
California	Coachella (All-American Canal)	10,000	16,000
	Madera Canal (Central Valley)	20,000	80,000

² Not yet approved by the President.

MUNICIPAL-INDUSTRIAL WATER AIDS WAR

Of equal importance with war power and war food production was a third major Reclamation wartime service—providing municipal-industrial water for major industries and military encampments, and for communities that were important in the war program.

As a multiple-purpose benefit, five operating projects met this need. Through construction on three other projects, additional areas in which shortages exist or threaten will be served with new supplies.

Boulder and Parker Dams in the Pacific Southwest, working as a team, stored fresh water from the Colorado River for diversion through the Metropolitan Water District aqueduct to busy Los Angeles and 12 nearby cities. Direct from Lake Mead above Boulder, 30 million gallons a day were piped to the world's largest magnesium plant at the peak of its activity.

The Contra Costa Canal of the Central Valley project (California) furnished water to important industries in the cities of the Upper San Francisco Bay area. The Rio Grande project (Texas-New Mexico), served El Paso, Tex., and nearby military encampments. Reclamation projects in Utah provided water for the cities of Salt Lake, Ogden, and Provo and a huge, new steel plant.

Raising the height of Altus Dam (Oklahoma) during the year will extend domestic water service during the fiscal year to important consumers in that area. Under construction are the Rapid Valley (South Dakota), and the Tucumcari (New Mexico), projects, which, in addition to providing irrigation service, will supplement the municipal supplies of the cities of Rapid Valley and Tucumcari, respectively. Through enlargement of the Weber-Provo Diversion Canal, principally for irrigation, and the construction of the Salt Lake Aqueduct, supplies will be made adequate for the Salt Lake and Provo areas, where the demand for water has risen sharply due to increased population and military centers.

CROP VOLUME AND VALUE AT RECORD LEVEL

With irrigation activities accelerated in accord with the demands for increased war food supplies, all records on Reclamation projects as to the acreage in production, total volume of crops, and crop values were broken in the calendar year 1943.

The 4,055,329 acres served wholly, or in part, by Bureau facilities on 44 projects in 15 Western States produced 10,660,000 tons of food and forage crops, valued at \$388,670,969. The gross returns were 43 percent, or \$116,622,453, greater than in calendar year 1942, which in turn exceeded the previous year's total by \$112,162,519. The skyrocketing of aggregate values was due partly to the fact that Reclamation farmers, despite labor difficulties and equipment shortages, had nearly doubled their actual production since the year of Pearl Harbor, and partly due to the sharp increase in market prices received for the commodities produced.

The returns cited are exclusive of the values of livestock fattened on Reclamation projects and of dairy and poultry products. These would increase quoted totals by about 25 percent.

The inventory of livestock and equipment on hand December 31, 1943, was valued at \$116,170,312, an increase of \$16,081,407 over the preceding year. Livestock values amounted to approximately \$950 per irrigated farm.

TABLE 1.—*Reclamation areas and crop returns, calendar year 1943¹*

	Irrigable area ²	Irrigated area	Area in cultivation (paying area)	Crop values

¹ A detailed table of area and returns by individual projects is available on request from the Bureau of Reclamation, Washington, D. C.

² Area for which Bureau is prepared to supply water.

³ Generally part of irrigable area, but not subject to construction charges until reclaimed.

⁴ Based on areas reported in both years and excluding temporarily suspended and leased lands.

⁵ Decrease due to readjustment of estimated acreage.

The cultivated area, exclusive of areas temporarily suspended and leased lands, was at a new high of 3,906,821 acres in 1943. This was an increase of 85,122 acres over 1942. On projects entirely constructed by the Bureau, the cultivated area rose to 1,900,088 acres. In 1942 it was 1,873,978 acres. Crop values in 1943 amounted to \$138,181,276, as compared with \$185,263,326 in 1942. The cultivated area on projects furnished supplemental storage from Bureau works and on those under special and Warren Act contracts, totaled 2,006,733 acres in 1943, as compared with 1,947,720 acres in the preceding year. The crop values were \$198,315,622 in 1943 and \$133,867,240 in 1942. On leased areas, Japanese relocation centers, etc., the cultivated area totaled 54,027 acres, and crop values, \$3,498,169.

Eighty-three percent of the irrigable area for which the Bureau was prepared to supply water—4,807,522 acres—was under irrigation in 1943.

Because of labor difficulties and price conditions, the area planted to sugar beets was reduced to 139,014 acres in 1943, a decrease of about 25 percent over 1942. The 1943 yield totaled 1,996,213 tons, which was valued at \$17,494,670.

Reclamation projects also produced small grains, fruit and nuts, long-staple cotton, flax, hops, vegetables, and seeds.

Due to the war, no new land has been opened to homestead entry during the last 3 years.

TABLE 2.—Cumulative crop values—1906-43

	Federal Irrigation projects				Warren Act Lands and Special Contractors				Entire area			
	Irrigated acreage	Net area in cultivation	Total crop value		Irrigated acreage	Net area in cultivation	Total crop value		Irrigated acreage	Net area in cultivation	Total crop value	
			For year	Cumulative total			For year	Cumulative total			For year	Cumulative total

Includes projects constructed by the United States and those for which supplemental water is furnished from storage works built by United States.

1 Includes projects constructed by the United States and those for which supplemental water projects.

2 Estimated.

3 Does not include project acreage and returns from All-American Canal (Imperial Valley) and 5 supplemental water projects.

4 Does not include project acreage and returns from 2 supplemental water projects. Estimated data for Imperial Valley included under "Special contractors." Includes

5 Does not include project acreage and returns from 1 supplemental water project. Estimated data for Imperial Valley included under "Special contractors." Includes

cultivated acreages and returns from class 5 lands, leased areas, and other lands irrigated from project works.

PROJECT PLANNING HAS POSTWAR OBJECTIVE

Foresight in the programming of its studies and investigations of potential projects and of river basins and subbasins made it possible for the Bureau of Reclamation to present to Congress in June 1944 a comprehensive inventory of postwar construction.

Planning activities directed in pre-war days toward an orderly agricultural and industrial development of the West, and early in the war toward increasing production of electric power and war food supplies, created a large shelf of projects which can be undertaken after the war to provide emergency employment and permanent settlement opportunities. During this fiscal year, with the emphasis shifted to planning for the postwar readjustment, additional projects were added to the reserve.

About 170 irrigation and multiple-purpose projects and approximately 50 river basins and subbasins were under study during the year. The Bureau investigates river basins in conjunction with studies of individual projects to assure orderly regional development.

The most impressive of the basin-wide studies completed during the year was the report on the Missouri River. It proposes construction costing a billion and a quarter dollars in the upper basin area, which construction would ultimately bring under irrigation 4¾ million acres of new land in seven States and supplement the water supply for half a million acres suffering shortages.

In connection with the June 1944 project inventory, there are on hand 53 detailed field reports involving construction costs amounting to \$526,000,000, and 25 detailed field reports of Water Conservation and Utilization projects under the war food program, estimated to cost \$21,000,000.

Postwar planning was given added impetus in June 1944, when Assistant Commissioner William E. Warne held conferences with Bureau regional officials in each of the six regions to determine the status of investigations and to plan for increased activity in this field. As a result of the meetings definite deadlines calling for the completion in the field of basin reports were set for early in the next fiscal year. These are: Columbia River Basin, December 1; Rogue River Basin, December 1; Central Valley, October 15; Santa Barbara County, September 15; Russian River Basin, September 1; Lower Colorado River Basin, November 1; Upper Colorado River Basin, November 1; Great Salt Lake Basin, December 1; Nueces River Basin, August 15; Rio Grande Basin, September 1; Red River Basin, September 15; Pecos River Basin, October 1; Guadalupe River Basin, October 15; Colorado River (Texas) Basin, November 1; and Arkansas River Basin, December 1.

As part of its planning activities, the Bureau reviewed flood control reports of the Corps of Engineers, War Department. This work was carried on under the terms of an agreement, dated August 14, 1939, through which the Bureau, the Department of Agriculture, and the War Department interchanged information on multiple-purpose projects. On December 29, 1943, this agreement was superseded by a four-party agreement, which made the Federal Power Commission also a participant, and changed the name of the joint committee to the "Inter-Agency River Basin Committee."

SERVICEMEN SEEKING POSTWAR FARMS

Forecasting the great need for postwar expansion of reclamation in the West, war veterans and emergency workers evinced a growing interest during the fiscal year in obtaining farms on Federal Reclamation developments. A growing number of inquiries concerning land settlement opportunities were received in the Washington, D. C., headquarters and in the many Bureau offices near military posts and war production centers.

Further evidence of the demand for land was the enlarged activity in the transfer of ownerships on irrigation projects, particularly near war industries where workmen, receiving high wages, purchased land for postwar homes.

In preparation for meeting the enlarged requirements for land, the Bureau's land use and settlement activities were pointed to postwar objectives. At the end of the year the Bureau had completed a program for presentation to Congress as a possible basis for legislation to provide settlement opportunities commensurate with anticipated needs. The program contained various recommendations for settlement preference for veterans, and provisions to assure that suitable farm units will be available on reasonable terms and conditions. It also called for farm advisory services.

SPECIAL STUDIES WILL AID SETTLEMENT PROGRAM

Three special studies of settlement and development problems advanced by the Bureau during the fiscal year will be of definite postwar value in making farm opportunities available for returning servicemen.

To provide maximum benefits from the complex multiple-purpose Central Valley project of California, a great volume of factual material on all phases of the proposed development has been collected through a series of project studies. These investigations are to be concluded early in the next fiscal year. Many Federal and State agencies are participating in the programming.

PROJECT PLANNING HAS POSTWAR OBJECTIVE

Foresight in the programming of its studies and investigations of potential projects and of river basins and subbasins made it possible for the Bureau of Reclamation to present to Congress in June 1944 a comprehensive inventory of postwar construction.

Planning activities directed in pre-war days toward an orderly agricultural and industrial development of the West, and early in the war toward increasing production of electric power and war food supplies, created a large shelf of projects which can be undertaken after the war to provide emergency employment and permanent settlement opportunities. During this fiscal year, with the emphasis shifted to planning for the postwar readjustment, additional projects were added to the reserve.

About 170 irrigation and multiple-purpose projects and approximately 50 river basins and subbasins were under study during the year. The Bureau investigates river basins in conjunction with studies of individual projects to assure orderly regional development.

The most impressive of the basin-wide studies completed during the year was the report on the Missouri River. It proposes construction costing a billion and a quarter dollars in the upper basin area, which construction would ultimately bring under irrigation $4\frac{3}{4}$ million acres of new land in seven States and supplement the water supply for half a million acres suffering shortages.

In connection with the June 1944 project inventory, there are on hand 53 detailed field reports involving construction costs amounting to \$526,000,000, and 25 detailed field reports of Water Conservation and Utilization projects under the war food program, estimated to cost \$21,000,000.

Postwar planning was given added impetus in June 1944, when Assistant Commissioner William E. Warne held conferences with Bureau regional officials in each of the six regions to determine the status of investigations and to plan for increased activity in this field. As a result of the meetings definite deadlines calling for the completion in the field of basin reports were set for early in the next fiscal year. These are: Columbia River Basin, December 1; Rogue River Basin, December 1; Central Valley, October 15; Santa Barbara County, September 15; Russian River Basin, September 1; Lower Colorado River Basin, November 1; Upper Colorado River Basin, November 1; Great Salt Lake Basin, December 1; Nueces River Basin, August 15; Rio Grande Basin, September 1; Red River Basin, September 15; Pecos River Basin, October 1; Guadalupe River Basin, October 15; Colorado River (Texas) Basin, November 1; and Arkansas River Basin, December 1.

As part of its planning activities, the Bureau reviewed flood control reports of the Corps of Engineers, War Department. This work was carried on under the terms of an agreement, dated August 14, 1939, through which the Bureau, the Department of Agriculture, and the War Department interchanged information on multiple-purpose projects. On December 29, 1943, this agreement was superseded by a four-party agreement, which made the Federal Power Commission also a participant, and changed the name of the joint committee to the "Inter-Agency River Basin Committee."

SERVICEMEN SEEKING POSTWAR FARMS

Forecasting the great need for postwar expansion of reclamation in the West, war veterans and emergency workers evinced a growing interest during the fiscal year in obtaining farms on Federal Reclamation developments. A growing number of inquiries concerning land settlement opportunities were received in the Washington, D. C., headquarters and in the many Bureau offices near military posts and war production centers.

Further evidence of the demand for land was the enlarged activity in the transfer of ownerships on irrigation projects, particularly near war industries where workmen, receiving high wages, purchased land for postwar homes.

In preparation for meeting the enlarged requirements for land, the Bureau's land use and settlement activities were pointed to postwar objectives. At the end of the year the Bureau had completed a program for presentation to Congress as a possible basis for legislation to provide settlement opportunities commensurate with anticipated needs. The program contained various recommendations for settlement preference for veterans, and provisions to assure that suitable farm units will be available on reasonable terms and conditions. It also called for farm advisory services.

SPECIAL STUDIES WILL AID SETTLEMENT PROGRAM

Three special studies of settlement and development problems advanced by the Bureau during the fiscal year will be of definite postwar value in making farm opportunities available for returning servicemen.

To provide maximum benefits from the complex multiple-purpose Central Valley project of California, a great volume of factual material on all phases of the proposed development has been collected through a series of project studies. These investigations are to be concluded early in the next fiscal year. Many Federal and State agencies are participating in the programming.

The Bureau has substantially completed the studies known as the Columbia Basin Joint Investigations, which have as their objective a general plan for the settlement of a million-acre area to be watered by Grand Coulee Dam, and to prepare detailed plans for areas to be irrigated relatively soon.

The investigation of economic and agricultural aspects of the practical problems which will confront settlers on the type of arid desert soil that characterizes the Yuma-Mesa Division of the Gila project (Arizona) was advanced during the year. This large-scale predevelopment demonstration was undertaken in January 1942 in accordance with a directive from the Senate Committee on Appropriations. At the end of the fiscal year 320 acres were planted to alfalfa, and 590 acres prepared for planting of this crop next fall.

The development of 4,200 acres of public lands which the current schedule, approved by the War Production Board, contemplates, will aid in meeting the demand for new farms and new homes. A total of 150,000 acres of new lands, both public and private, may be developed rapidly on the Yuma-Mesa as a result of the knowledge gained from the investigation.

CONSTRUCTION CONTINUES DESPITE CURBS

Construction activities of the year were highlighted by the completion of Shasta Dam, second largest concrete structure in the world, and key feature of the Central Valley project (California), and the "holing through" of the 13.1 mile long Alva B. Adams tunnel of the Colorado-Big Thompson project (Colorado). Both Reclamation achievements were accomplished at the close of the fiscal period.

Shasta Dam is 602 feet high, 3,500 feet long at the crest, and 265 feet wide at the base. On June 30, 1944, it contained 6,391,682 cubic yards of concrete. Construction was begun in September 1938.

The transmountain tunnel cuts through the Rocky Mountains near Estes Park, Colo. When lined with concrete, which operation is now in progress, it will carry a supplemental supply of water from the headwaters of the Colorado River, on the west side of the Continental Divide, to 615,000 acres facing shortages in northeastern Colorado, on the east slope.

The Bureau's construction activities were retarded on most projects as the aftermath of a sweeping War Production Board stop-construction order issued in the fall of 1942, which halted all work except power installations on five projects. Since that time the War Production Board has cleared a number of projects to create work for Japanese evacuees from the Pacific coast and for conscientious objectors, to supply municipal-industrial water, to provide dust control for an air base, and to expand food production. Twenty-five projects were cleared under the war food program.

Work remained at a standstill on Davis Dam (Arizona-Nevada); Payette Division, Boise Project (Idaho); Friant-Kern Canal of the Central Valley project (California); irrigation features of the Columbia Basin Project (Washington); Eden, Kendrick, and Riverton projects (Wyoming).

Additional details on construction activities are provided in the summary of the activities of the various regions.

BUREAU ENGINEERS FOREMOST AS DAM BUILDERS

Since 1902 179 dams—5 of them the largest concrete structures in the world—have been constructed by the Bureau of Reclamation on 61 irrigation and multiple-purpose projects in 16 Western States. The 5 mammoth monoliths, which have given Bureau engineers the reputation of being foremost in the field of dam designing and construction are, in order of volume: Grand Coulee (Washington), Shasta (California), Boulder (Arizona-Nevada), Friant (California), and Marshall Ford (Texas).

The Bureau has also built the following existing facilities: 31 power-plants, 5,937 miles of transmission lines, 212,549 canal structures, 14,421 bridges, 358 tunnels having a combined length of 110.7 miles, 5,121 miles of ditches and drains, 23,683 culverts, 6,555 flumes, 2,322 miles of pipe, and 4,344 miles of roads. In the 42 years of its existence as a Federal agency, the Bureau has excavated 621,790,400 cubic yards of earth and rock—more than 60 times the bulk of the 7 great pyramids of Egypt. A total of 34,225,500 cubic yards of concrete have been poured, more than 6 times as much as used in all the locks and structures of the Panama Canal. In the preparation of this concrete, 38,475,900 barrels of cement were used.

STORAGE CAPACITY AT NEW PEAK

The storage capacity of 81 Reclamation reservoirs was increased by about 5 million acre-feet during the fiscal year. The June 30, 1944, capacity was 69,174,919 acre-feet. The active water storage—more than 53½ million acre-feet—was also at a record level. The largest of the man-made lakes were impounded by Boulder Dam (Arizona-Nevada), Grand Coulee Dam (Washington), and Marshall Ford Dam (Texas). Storage of water in the reservoir behind Shasta Dam was begun on December 30, 1943, and behind Friant Dam on February 22, 1944.

JAPANESE EVACUEES ON THREE PROJECTS

Increased war food production, valued at \$460,272, resulted from the activity in 1943 of persons of Japanese ancestry on 3 Reclamation projects, to which they were evacuated from West Coast military zones

18 • *Report of the Secretary of the Interior*

early in the war. The approximately 38,000 men and women housed in the War Relocation Centers harvested 4,861 acres of hitherto undeveloped land.

The camps are located on the Gooding Division of the Minidoka project (Idaho), which at the peak of the year's activity held 10,000 persons; the Tule Lake Division of the Klamath project (Oregon-California), 18,027; and the Heart Mountain Division of the Shoshone project (Wyoming), 9,800.

In addition to farm activities, the Japanese aided in Bureau construction operations on the Minidoka and Shoshone projects. The camps were erected by the Army engineers, and the Bureau had charge of the work crews.

SMALL C. P. S. CREWS BUILDING DAMS

Construction was advanced on three medium-sized irrigation dams on the Rapid Valley (South Dakota), Deschutes (Oregon), and the Mancos (Colorado) projects by conscientious objectors housed in Civilian Public Service camps, established by the Selective Service System. The assignees also helped clear the reservoirs and performed other work. At the end of the year 124 men were stationed in the Rapid Valley camp, 90 in the Deschutes center, and 117 on the Mancos project. In the first 2 camps a religious organization was responsible for the welfare of the men, and the Bureau was in charge of the work. On the Mancos project all operations were supervised by Reclamation officials.

A small group of men in a camp administratively assigned to the Farm Security Administration was employed on Reclamation activities on the Buffalo Rapids project (Montana).

WATER CONSERVATION AND UTILIZATION CONSTRUCTION STIMULATED

Enactment of amendments to the Water Conservation and Utilization Act, and added emphasis on expansion of production of war food crops, caused increased activity under the Water Conservation and Utilization program during the year. Work continued on six projects authorized for construction before the war. Preconstruction activities were underway on six additional projects approved under the war food program.

The amendments to the Water Conservation and Utilization Act authorize, for the duration of the war, the expenditure of appropriated funds for project construction in lieu of contributions formerly made by the Work Projects Administration and the Civilian Conservation Corps.

The projects under construction are: Mirage Flats (Nebraska), Buffalo Rapids No. 2 (Montana), Newton (Utah), Rapid Valley (South Dakota), Mancos (Colorado), and Scofield (Utah).

Other projects cleared for construction and the acreages involved are: Intake (Montana), Missoula (Montana), Dodson (Montana), Bitterroot (Montana), Post Falls unit, Rathdrum Prairie project (Idaho), and Balmorhea (Texas).

Construction remains at a standstill, due to War Production Board stop orders on the Fallon unit of the Buffalo Rapids project (Montana), and on the Eden project (Wyoming).

During the year the Farm Security Administration, in accordance with the original approval by the President, assumed supervision and control of the operation and maintenance work on the Buford-Trenton project (North Dakota), which is providing water for 4,000 acres. The Farm Security Administration is also in charge of land development and settlement activities on the Buffalo Rapids No. 1 project, on which about 15,000 acres of land have been put under irrigation.

REGIONAL ACTIVITIES ADVANCE RECLAMATION

While not yet fully effectuated, chiefly because of difficulties in obtaining suitable personnel, the regionalization of the Bureau of Reclamation, begun in September 1943, intensified operations in all fields of Reclamation activity. The following is a summarization of the most important activities in each of the areas.

REGION I

The outstanding wartime activities in Region I during the fiscal year were the expansion of power production at Grand Coulee Dam (Washington), for industrial plants, and the extension of irrigation service on the highly productive Roza Division of the Yakima project (Washington). The region includes the States of Oregon, Washington, Idaho, and western Montana.

The Bureau's power program at Grand Coulee was spectacular. Three units rated at about 325,000 kilowatts were installed to complete, in 3 years, the transformation of an empty shell of a building into the second largest powerplant in the world. The fiscal year output was approximately 5,800,000,000 kilowatt-hours, double the production of the preceding year. In March 1944, the plant produced 621 million kilowatt-hours, a world's record for quantity of power generated during 1 month by a single hydroplant. About 98 percent of the Grand Coulee energy is consumed by war industries.

On the Roza Division, the acreage under irrigation was increased during the year from 9,000 to 15,000 acres. Ultimately the gravity system, under construction, will serve a total of 47,000 acres, whereon excellent settlement opportunities for returning servicemen and demobilized war workers could be provided.

Construction work in Region I was continued, under wartime restrictions, on the Deschutes project (Oregon), Anderson Ranch Dam

of the Boise project (Idaho), and the Gooding Division of the V doka project (Idaho).

Construction of Anderson Ranch Dam, which when completed will be the highest earth-fill structure in the world and will provide supplemental irrigation water for 340,000 acres in the fertile Boise Valley, was resumed after delay of about a year due to War Production Board restrictions. About 1,300,000 cubic yards of embankment and 700,000 cubic yards of rock-fill were placed during the year to bring the total yardage in place to about 2¼ million. Ultimately the dam will contain 9,600,000 cubic yards of material.

Design and location of irrigation features and development of settlement pattern for the Columbia Basin project (Washington) were advanced. This project, of which Grand Coulee Dam is the key structure, offers the largest settlement opportunities of any single project in the Bureau's postwar program.

REGION II

Completion of Shasta Dam, dominant structure of the Central Valley project (California), at the end of the fiscal year, climaxed construction activities in this region, which includes central and northern California, and a small portion of Oregon. The Shasta Reservoir, gradually filling since December 30, 1943, contained 1,175,129 acre feet of storage on June 30, 1944, more than a third of its maximum capacity.

The first two of five 75,000-kilowatt generators to be installed at the Shasta powerplant began production in June 1944, sending their output, under a wartime contract, over the newly completed Government transmission line to a connection with the Pacific Gas & Electric system at Oroville, Calif.

Three other major items of the Central Valley project were featured in the region's construction program. Keswick Dam and powerplant, construction of which was halted for a time by the War Production Board, were practically completed. Work was being advanced rapidly on four contracts for the construction of 28 miles of the Madras Canal, which when completed will serve 20,000 acres of new land and provide supplemental service to 80,000 acres. Eight miles of the canal had been completed previously.

Installation at Friant Dam of needle valves borrowed from Bixby Dam to provide temporary control over the San Joaquin River was practically completed. Water storage in Millerton Lake was begun February 22, 1944, and had reached 290,490 acre feet—approximately half maximum capacity—at the end of the year.

Construction of the 160-mile Friant-Kern Canal of the Central Valley project remains at a standstill. An application for clearance is pending before the War Production Board.

With War Production Board authorization under the war food program, granted on September 8, 1943, construction was resumed on the Iodoc unit of the Klamath project (Oregon-California). On June 3, 1944, the War Production Board approved construction of the extension of this unit.

Region II is featured prominently in the Reclamation postwar inventory. Twenty-nine projects, which would serve 1,281,500 acres of new land and provide supplemental water to 3,485,000 acres now inadequately served are contemplated. Power installations on authorized projects would be increased by 446,500 kilowatts and an estimated 288,900 kilowatts of firm capacity would be provided on projects under study. The over-all cost of the postwar program in this region, on the basis of 1940 prices, would be \$551,360,000.

REGION III

With more than half the electric power produced by Reclamation power plants on projects in 12 States coming from Bureau installations within its boundaries, Region III was outstanding as a contributor to the prosecution of the war. This region includes nearly all of the State of Arizona, Southern California, and small portions of Nevada, New Mexico, and Utah.

Approximately 7 billion kilowatt-hours of energy were generated during the year. More than 50 percent of all the power used by the war industries of Southern California, southern Nevada, and Arizona was produced by Bureau generators in this area. These are located on five projects: Yuma and Salt River (Arizona); Boulder Canyon (Arizona-Nevada); Parker Dam (Arizona-California) and All-American Canal (California). After the war, and as the need arises, the present installation can be doubled.

Although no capacity was added, the output of the Boulder Dam power plant, largest in the world, was increased by 20 percent over the preceding year. By increasing the production of its generators, the output was brought to a new high of 6 $\frac{1}{3}$ billion kilowatt-hours. Revenues from the sale of this energy and for generating charges totaled \$8,162,422.86. One-fourth of the plant's production was consumed by a huge magnesium plant nearby. A new 82,500-kilowatt generator is scheduled to go into operation in September 1944.

Region III also contributed heavily toward the Nation's war food supply. The 744,380 acres of land served by Reclamation facilities produced crops having a gross value of \$109,371,178—an all-time high for the area.

Twenty-three of the projects in the postwar inventory are located in this region. The over-all cost of constructing these developments, on the basis of pre-war prices, is estimated at \$720,015,000.

Three of the projects have been authorized for construction, namely: Boulder Dam, with 287,500 kilowatts additional power capacity remaining to be installed, the Mesa Unit of the Gila project (Arizona), to provide water for 33,000 acres of new lands, and the All-American Canal (California) from which 400,000 acres of new lands may be irrigated and 20,000 provided with supplemental water.

Construction of a fourth project, Davis Dam, to provide river regulation and 225,000 kilowatts of power, was halted by the War Production Board late in 1942. Nineteen projects which will irrigate 454,235 acres of new lands, furnish supplemental water to 374,200 acres, and provide 1,099,200 kilowatts of firm power are under study.

REGION IV

With large-scale construction halted or retarded by emergency conditions, project planning activities received major attention in region IV. This region includes practically all of the States of Nevada and Utah, the southwestern portion of Wyoming, and that portion of Colorado west of the Continental Divide.

Work was advanced on more than 25 individual projects and sub-basins, with 6 reports completed and 14 reports nearing completion. The reports form the foundation for that portion of the reclamation inventory planned for region IV. The outline calls for the construction of 46 projects. These would serve 313,790 acres of new land, provide supplemental service to 684,940 acres, make available 8,600 kilowatts of new energy on authorized projects and 148,000 kilowatts of firm power capacity on proposed developments. On the basis of 1940 prices, the estimated construction cost is \$237,603,000.

Construction continued during the year on four projects. Conscientious objectors aided in constructing a medium-sized dam on the Mancos project (Colorado). The Newton Dam on the Newton project (Utah) was practically completed, and work was advanced on the Scofield project (Utah). Sufficient work was completed during the past 2 years on the canals of the Provo River project (Utah) to provide supplemental water in 1943 to more than 25,000 acres of highly developed lands and serve an industrial supply to the new \$200,000,000 Geneva Steel plant near Provo, Utah. Progress was also made on the Salt Lake Aqueduct of the Provo River project to make additional water available to Salt Lake City.

REGION V

Planning for postwar construction received primary consideration in Region V. In this region, comprising all of Texas and Oklahoma, that portion of New Mexico east of the Continental Divide, the south-east quarter of Colorado, and the southern half of Texas, 2 projects

are in operation, 3 under construction, 3 authorized, and 26 are under study.

More than 2,653,000 acres of land are now irrigated in the area; 194,000 of which are included in Federal reclamation projects. Construction of 30 projects outlined in the postar inventory would provide an irrigation water supply for 637,310 acres of additional land and furnish a supplemental supply of 1,615,980 acres now partially irrigated. About 18,000 kilowatts of additional electric power could be installed on authorized projects and 36,000 kilowatts of firm capacity made available on proposed developments. Total construction costs, based on 1940 prices, are estimated at \$296,786,000.

Construction was in progress, under the war food program, on the Tucumcari project (New Mexico), and the Altus project (Oklahoma). Work on both was suspended by the War Production Board in December 1942. In April 1944 both projects were cleared for war food construction. Development plans for the Tucumcari project call for 17,000 acres to be brought into production by 1945, with additional acreages subsequently. The Altus project by 1945 is to provide irrigation service to 20,000 acres and a domestic water supply to the city of Altus. It is scheduled to serve an additional 20,000 acres in 1946.

The three projects authorized are Valley Gravity Canal and Storage project (Texas), San Luis Valley project (Colorado), and the Balmorhea project (Texas). The latter was approved by the President in May 1944, and construction work will be begun as soon as negotiations for the purchase of additional water rights and for repayment contracts are completed. Construction on the Valley Gravity and San Luis Valley was halted by the War Production Board.

REGION VI

The Bureau of Reclamation's project planning activities in the West drew national recognition in the fiscal year because of the accomplishments in this region. Completed here was a comprehensive report on the conservation, control, and use of the water resources of the entire Missouri River Basin, one of the Nation's greatest drainage areas.

Region VI includes the States of North Dakota, South Dakota, Nebraska, the northern half of Kansas, northeastern Colorado, all of Montana east of the Continental Divide, and a major portion of Wyoming.

The investigations report was the culmination of more than 5 years of planning work. It was presented to Congress early in June 1944, and bills were introduced in both houses that would authorize the construction of the initial stages of the development planned.

Constituting a major item in the Bureau's postwar outline, the report proposes the irrigation of 4,760,000 acres of new land, the construction of about 90 multiple-purpose reservoirs, 16 power plants with a total installed capacity of 723,500 kilowatts and interconnecting transmission systems, flood control for the lower reaches of the Missouri River and many of its tributaries, and a sustained flow for navigation from Sioux City to St. Louis.

The estimated total construction cost of the entire program is \$1,250,000,000, and the initial developments recommended for construction would involve an expenditure after the war, of approximately \$200,000,000, for the irrigation and power features alone.

Completion on June 10, 1944, of the excavation of the 13.1-mile long transmountain tunnel of the Colorado Big-Thompson project through the Rocky Mountains to carry supplemental water from the west to the east slope was the most important construction achievement of the year in this region.

OPERATION AND MAINTENANCE ACTIVITIES OUTLINED

The operation and maintenance of irrigation systems constructed by the Bureau was directed towards assuring water supplies for more than a million acres of land and the protection of the Federal investment. Supervision was given to 15 projects or completed portions of projects operated in their entirety by the Bureau, and to the dams, reservoirs, and other reserved works on 6 other projects. Administration was also extended to 26 projects or portions of projects where operations were conducted by water users' organizations under contract with the United States. Approximately 120 separate water users' organizations on these projects have contracts with the Federal Government.

SETTLERS GIVEN AID AND ADVICE

Maximum war food production through improved farming methods was one of the year's prime objectives for the Branch of Operation and Maintenance. Settlers were assisted in effectuating up-to-date practices in the proper utilization of land and water both by regular Bureau employees and by assistant county agents of the Extension Service of the Department of Agriculture, under a Memorandum of Understanding, dated June 12, 1940. The work performed included assisting landowners and water users in laying out and constructing farm irrigation systems, preparing land for irrigation, rendering advice in the economic use of water, alleviation of seepage conditions, and control of noxious weeds.

Considerable educational material was prepared and disseminated, including slide lectures and films designed to assist farmers in the development of pastures, measurement and proper use of irrigation water, and weed control.

SOIL AND CONSERVATION PROGRAM CONTINUED

Extensive field work in the lining of canals to conserve water and prevent damage to irrigable lands by seepage was carried on under the Soil and Moisture Conservation program. Asphalt and bentonite linings were installed and tested from the standpoint of design, placement, effectiveness, and cost, and results compared with standard concrete and earth linings. Other activities included: Prevention of canal bank erosion by vegetative plantings, investigation of methods to reduce siltation of canals and reservoirs, drainage work to relieve seepage, and installation of accurate devices for measurement of irrigation water, and studies of the requirements for and application of irrigation water by reason of relative impermeable characteristics of some soils.

MILLION ACRES OF WITHDRAWN LAND RESTORED

More than a million acres of land, most of which was public land withdrawn by the Bureau in connection with completed or partially

Extensive field work in the lining of canals to conserve water and prevent damage to irrigable lands by seepage was carried on under the Soil and Moisture Conservation program. Asphalt and bentonite linings were installed and tested from the standpoint of design, placement, effectiveness, and cost, and results compared with standard concrete and earth linings. Other activities included: Prevention of canal bank erosion by vegetative plantings, investigation of methods to reduce siltation of canals and reservoirs, drainage work to relieve seeped land, installation of accurate devices for measurement of irrigation water, and studies of the requirements for and application of irrigation water by reason of relative impermeable characteristics of some soils.

¹ Farms furnished partial or whole water supply by Bureau-constructed works.
² Data not reported.
³ Data not reported.

OPERATION AND MAINTENANCE ACTIVITIES OUTLINED

The operation and maintenance of irrigation systems constructed by the Bureau was directed towards assuring water supplies for more than 4 million acres of land and the protection of the Federal investment.

Supervision was given to 15 projects or completed portions of projects operated in their entirety by the Bureau, and to the dams, reservoirs, and other reserved works on 6 other projects. Administration also extended to 26 projects or portions of projects where operations are conducted by water users' organizations under contract with the United States. Approximately 120 separate water users' organizations on these projects have contracts with the Federal Government.

SETTLERS GIVEN AID AND ADVICE

Maximum war food production through improved farming methods was one of the year's prime objectives for the Branch of Operation and Maintenance. Settlers were assisted in effectuating up-to-date practices in the proper utilization of land and water both by regular Bureau employees and by assistant county agents of the Extension Service of the Department of Agriculture, under a Memorandum of Understanding, dated June 12, 1940. The work performed included assisting landowners and water users in laying out and constructing farm irrigation systems, preparing land for irrigation, rendering advice in the economic use of water, alleviation of seepage conditions, and control of noxious weeds.

Considerable educational material was prepared and disseminated, including slide lectures and films designed to assist farmers in the development of pastures, measurement and proper use of irrigation water, and weed control.

SOIL AND CONSERVATION PROGRAM CONTINUED

Extensive field work in the lining of canals to conserve water and prevent damage to irrigable lands by seepage was carried on under the Soil and Moisture Conservation program. Asphalt and bentonite linings were installed and tested from the standpoint of design, placement, effectiveness, and cost, and results compared with standard concrete and earth linings. Other activities included: Prevention of canal bank erosion by vegetative plantings, investigation of methods to reduce siltation of canals and reservoirs, drainage work to relieve seeped land, installation of accurate devices for measurement of irrigation water, and studies of the requirements for and application of irrigation water by reason of relative impermeable characteristics of some soils.

MILLION ACRES OF WITHDRAWN LAND RESTORED

More than a million acres of land, most of which was public land withdrawn by the Bureau in connection with completed or partially

28 • *Report of the Secretary of the Interior*

completed projects or projects under investigation, were not entry during the fiscal year.

Approximately 929,500 acres of public land were under lease in calendar year 1943; 688,000 acres for grazing purposes, 230,000 for agricultural uses (8,500 more than in 1942), and 188,000 for special uses, including the areas reserved for Japanese evacuees. Some additional lands were leased early in 1944 for expanding stock and farming operations to increase food production. Reclaimable land temporarily transferred to the Grazing Service to provide efficient range administration under the Taylor Grazing Act was reduced by the vacation of reclamation withdrawals and by transfer to the War Relocation Authority for Japanese encampments.

AMENDATORY CONTRACT NEGOTIATIONS ADVANCED

Under the Bureau's reorganized plan of procedure, active progress was made at the close of the fiscal year toward completion of negotiations of amendatory repayment contracts with a number of water users' organizations. To date eight contracts have been executed. One contract negotiated with the Klamath Drainage District of the Klamath project (Oregon-California) was approved by Congress June 17, 1944. Power features contained in several agreements given special attention.

Reclassification of irrigable lands under provisions of the Act was completed or in progress on approximately 298,000 acres in projects or divisions of projects.

REQUESTS FOR RELIEF CONTINUE TO DECREASE

With farm incomes in 1942 and 1943 at high levels and prospects good for continuing high returns in 1944, requests and authorization for temporary relief from the payment of accrued construction costs dropped to new lows during the fiscal year. Applications for an amount of \$108,092.33, were submitted by eight water-users' organizations. Relief totaling \$21,916.44 was granted to four applicants.

In comparison, applications totaling \$189,922.44 were received during the fiscal year 1943 from six water-user groups and seven individuals. Relief in the amount of \$24,530 was authorized.

NEW LEGISLATION ADVANCES RECLAMATION

Three major items of legislation affecting Reclamation were enacted during the year. The Water Conservation and Reclamation (Wheeler-Case) Act was amended, construction of the Horse Dam (Mont.) was authorized, and Congress gave its approval to the Belle Fourche Compact.

AMENDMENTS TO WATER CONSERVATION AND UTILIZATION ACT PASSED

To provide for a quick expansion of potential food-producing acres on projects in the process of construction under the Water Conservation and Utilization Act of October 14, 1940 (54 Stat. 1119), Congress amended this legislation on July 16, 1943 (Public, 152, 78th Cong., 1st Sess.).

The amendments authorize the expenditure of appropriated funds for construction in lieu of nonreimbursable money or services formerly contributed by the Work Projects Administration and the Civilian Conservation Corps, which were disbanded early in the war. The original Act has as its objective the stabilization of agriculture and employment in the Great Plains and other semiarid areas to the westward which are most seriously affected by periodic droughts.

CONGRESS GIVES CONSENT TO BELLE FOURCHE COMPACT

The long-standing controversy between the States of South Dakota and Wyoming over the division of waters of the Belle Fourche River was brought to an end in February 1944, when Congress gave its consent to the Belle Fourche Compact.

The legislation clears the way for construction of works to provide supplemental storage for irrigation projects in South Dakota and also storage for potential projects in Wyoming. Incorporated in the compact is a provision giving Federal recognition of water rights as against an assertion of power under the Commerce Clause of the Constitution. It requires the Federal Government to respect established water rights as property and to consult with State officials with respect to specific Federal programs or projects.

HUNGRY HORSE DAM APPROVED AS POSTWAR PROJECT

Construction of Hungry Horse Dam, a major feature of the comprehensive plan for multiple-purpose development of the Columbia River in the Pacific Northwest, was authorized by Congress on June 5, 1944 (Public, 329, 78th Cong., 2d Sess.). This structure, to be erected 4 miles above the confluence of the South Fork and Flathead Rivers in Montana, is a prominent item in the Bureau's inventory of irrigation and multiple-purpose projects for postwar construction. It would increase the firm power output of Grand Coulee and Bonneville Dams through regulation of the flow of the Flathead River. The act also authorizes an irrigation development in the vicinity of Kalispell, Mont.

BUREAU PREPARING VETERAN SETTLEMENT LEGISLATION

Drafting of legislation which would make homesteads available on Reclamation projects for returning servicemen after the war, in con-

junction with the Bureau's postwar construction program, was well advanced at the end of the fiscal year. Under tentative plans, the settlement program would be handled by the Department of the Interior in cooperation with the agencies that are charged directly with the administration of veteran affairs. The Bureau's legal staff is engaged in preparing a report on and drafting amendments to H. R. 3179, introduced by Congressman Murdock of Arizona, which would provide opportunities for veterans to reestablish themselves on irrigated farms.

SEEK TO AMEND PROJECT ACT OF 1939

Pending before Congress was legislation which would amend Sections 4, 7, and 17 of the Reclamation Project Act of 1939. The principal objective of the bill, reported out by the Senate Committee on Irrigation and Reclamation, is to extend the time within which amendatory contracts may be made to December 31, 1950, or 5 years after the end of the war, whichever period is the longer. With additional personnel available in the postwar period, it is expected many amendatory contracts can be negotiated. Relief provisions of the Act would also be extended by the measure.

BUREAU DECENTRALIZATION EFFECTUATED

Decentralization of the Bureau of Reclamation through the establishment of six regional offices and five administrative branches in Denver, Colo., the objective of which was to "streamline" the organization for greater efficiency in meeting war and postwar problems, was effectuated during the fiscal year.

Six outstanding Bureau officials were placed in charge of each region as Regional Directors of Reclamation, and five others, experienced in their respective fields, were named to head the branches. These are: Design and Construction, Project Planning, Operation and Maintenance, Fiscal and Administrative Management, and Power Utilization. Regional offices were established in Boise, Idaho; Sacramento, Calif.; Boulder City, Nev.; Salt Lake City, Utah; Amarillo, Tex.; and Billings, Mont.

The Regional Directors are responsible for coordinating all Bureau activities within their regions, and they report directly to the Commissioner. They have extensive latitude for independent action. Assistance in technical phases of their work is provided by the Branch heads.

On the basis that the improved organization would provide added protection of the Federal investment in irrigation and multiple-purpose projects, and that it was essential because of the Bureau's greatly expanded activities, nonreimbursable funds were sought for the cost

of administration, without success. Further efforts to obtain these funds will be made in fiscal year 1945, with continued emphasis to be placed on the fact that the decentralization extends a significant portion of the Commissioner's function (the cost of which is nonreimbursable) to the field.

Military furloughs, resignations, and transfers reduced the number of Reclamation employees from 6,543 on June 30, 1943, to 6,513 on June 30, 1944. Twenty-one Washington employees and 1,643 field employees were in the armed forces of the United States. Twelve have given their lives and 2 are missing.

The number of persons employed in the various Bureau activities were: Commissioner's office, 98; branch offices (Denver Colo.), 820; legal office (Denver), 13; Region 1, 1,733; Region 2, 833; Region 3, 1,050; Region 4, 312; Region 5, 1,109; Region 6, 545.

During the year the number of field offices, exclusive of headquarters for project planning work, was reduced from 54 to 50.

COMMISSIONER AND TWO ASSISTANTS APPOINTED

Harry W. Bashore, Assistant Commissioner of Reclamation since May 27, 1939, and for more than 37 years a Bureau employee, took office as Commissioner on August 3, 1943, upon appointment by the President. He replaced John C. Page, who resigned in June 1943 because of ill health. Mr. Page had served as Commissioner since January 25, 1937.

Secretary of the Interior Harold L. Ickes appointed two Assistant Commissioners during the year; namely, William E. Warne, former Chief of Information for the Bureau, and Kenneth Markwell, former Regional Director of the Federal Works Agency. Mr. Warne took office on August 9, 1943, and Mr. Markwell on April 18, 1944.

RECLAMATION FUND ACCRETIONS

In the 42 years of the Bureau's history, the accretions to the Reclamation fund have totaled \$220,910,306.02. (See table 4.) These have come from the sale of public lands, proceeds from the Oil Leasing Act, from Federal water power licenses, potassium royalties, and rentals and receipts from Naval petroleum reserves from 1920 to 1930 under the act of May 9, 1938. Collections—construction and operation and maintenance repayments, water rentals, power revenues, etc.—have totaled \$159,748,056.18.

Disbursements during that period have totaled \$349,523,020.29, leaving a balance in the fund on June 30, 1944, of \$31,135,346.91. Repayments of construction charges to the Reclamation fund during the fiscal year 1944 totaled \$400,000,000. Operation and maintenance collections amounted to \$1,400,000, and water rental, power, and other receipts aggregated \$6,000,000.

The total collections reflect the improved financial condition of Reclamation farmers and their continued response to the President's anti-inflation policy by maintaining a good record of repayments. The high level of the Reclamation fund provides resources for the extension of irrigation investigations and for the extension of irrigation systems when the resumption of construction is possible.

FEDERAL INVESTMENT EXCEEDS \$900,000,000

The Federal investment in Reclamation since June 17, 1902, when the Reclamation law was approved, topped the \$900,000,000 mark in 1944. Expenditures for construction on all projects during the 12-month period totaled \$51,665,144.79, bringing the total Federal outlay under Reclamation to \$921,770,619.71. (See table 5, p. 34.)

Despite the war restrictions on materials and manpower, progress was made on the construction of irrigation systems under the war food program. While clearances from the War Production Board were not available sufficiently early in the fiscal year to complete war food schedules as planned, the Bureau of Reclamation was able to lay the groundwork for more rapid construction during the fiscal year 1945 and 1946.

The funds available for advancing power installations under the war power program enabled the Bureau to increase substantially not only the Federal investment in power facilities on reclamation projects, but to provide facilities, through additional storage and generating equipment, that are providing revenues for assisting in financing the cost of irrigation systems.

The importance from a financial standpoint of the power installations on Reclamation projects is illustrated by preliminary studies which indicate that about 50 percent of the repayable costs of the entire reclamation construction program as laid out at the beginning of the war, will come from power revenues. Approximately 45 percent of these costs will be repayable by irrigation water users, and the remaining costs will be allocated to nonreimbursable purposes such as flood control, navigation, and contributed labor, or will be repayable by municipalities for supplemental water supplies.

The Congress appropriated \$18,907,200 for construction of irrigation facilities during the fiscal year 1945. The total unexpended balance for construction purposes of all kinds brings to \$80,628,000 the total funds available for this activity by the Bureau of Reclamation during 1945.

Control over the construction of irrigation, power, and other facilities remained in the hands of the War Production Board. Construction of irrigation facilities is recommended to the War Production Board by the War Food Administration, and the construction of power facilities is subject to the direct consideration of the War Production Board.

Division of Power

ARTHUR GOLDSCHMIDT, Director

AFTER the war the problem of how to cope with abundance will beset our economy all along the line, and unless it is solved, will threaten the development of vital irrigation and flood control works dependent upon the Midas touch of power. Power facilities that were hastened to completion for war production must not remain idle to block further multiple-purpose water conservation needed throughout the Nation. Hydroelectric power cannot stagnate without dire results any more than manpower can. If it is unemployed the men and the capital that it supports will be unemployed also.

The country expects this Department to take the initiative in averting such a catastrophe, and quite naturally. We operate the largest aggregate of hydroelectric capacity in the world. We also market power which is generated at dams that are operated by the United States Army Corps of Engineers. The generating plants from which the Department of the Interior markets power produced 17.6 billion kilowatt-hours of energy during the fiscal year, as compared with 12 billion kilowatt-hours last year. As the year ended the total capacity of Department plants in operation amounted to 2,795,000 kilowatts. Other units now being tested will increase this total to more than 3 million kilowatts—an amount of energy sufficient to supply three cities the size of greater New York. And the Rivers and Harbors bill and the Omnibus Flood Control bill, both pending, would authorize the Secretary of the Interior to market, in addition, all the excess power which would be generated by these new projects that are to be constructed by the War Department.

Consequently, this Department has prepared to undertake the task of employment agent to find jobs for power after the war. The job can be simply stated, but it is not simple. We know that a lot of power will be needed in the West, but power works under contract, and in order to prepare for contracts we must know accurately how much power is to be delivered, and precisely where. Approximately how much and

Other units now being tested will increase this total to more than 3 million kilowatts—an amount of energy sufficient to supply three cities the size of greater New York. And the Rivers and Harbors bill and the Omnibus Flood Control bill, both pending, would authorize the Secretary of the Interior to market, in addition, all the excess power which would be generated by these new projects that are to be constructed by the War Department.

Consequently, this Department has prepared to undertake the task of employment agent to find jobs for power after the war. The job can be simply stated, but it is not simple. We know that a lot of power will be needed in the West, but power works under contract, and in order to prepare for contracts we must know accurately how much power is to be delivered, and precisely where. Approximately how much and

Division of Power

ARTHUR GOLDSCHMIDT, Director

AFTER the war the problem of how to cope with abundance will beset our economy all along the line, and unless it is solved, will threaten the development of vital irrigation and flood control works dependent upon the Midas touch of power. Power facilities that were hastened to completion for war production must not remain idle to block further multiple-purpose water conservation needed throughout the Nation. Hydroelectric power cannot stagnate without dire results any more than manpower can. If it is unemployed the men and the capital that it supports will be unemployed also.

The country expects this Department to take the initiative in averting such a catastrophe, and quite naturally. We operate the largest aggregate of hydroelectric capacity in the world. We also market power which is generated at dams that are operated by the United States Army Corps of Engineers. The generating plants from which the Department of the Interior markets power produced 17.6 billion kilowatt-hours of energy during the fiscal year, as compared with 12 billion kilowatt-hours last year. As the year ended the total capacity of Department plants in operation amounted to 2,795,000 kilowatts. Other units now being tested will increase this total to more than 3 million kilowatts—an amount of energy sufficient to supply three cities the size of greater New York. And the Rivers and Harbors bill and the Omnibus Flood Control bill, both pending, would authorize the Secretary of the Interior to market, in addition, all the excess power which would be generated by these new projects that are to be constructed by the War Department.

Consequently, this Department has prepared to undertake the task of employment agent to find jobs for power after the war. The job can be simply stated, but it is not simple. We know that a lot of power will be needed in the West, but power works under contract, and in order to prepare for contracts we must know accurately how much power is to be delivered, and precisely where. Approximately how much and

approximately where within half a continent will not do. And the answer to these questions depends on the answers to innumerable others that stem from one big question—what kind of world will the postwar world be? How can more power be employed on the farm, in the home and in the factory? How fast will we fill back orders for such familiar things as radios and refrigerators? What now-unfamiliar things will become as commonplace as bathtubs? What will these necessities be made of? From what base will we extract the raw material? At what rate will they be manufactured? How will altered transportation practices affect certain sections? These and a book-length roster of other questions must be answered before we can know where there will be jobs for power, and for how much power, after the war.

Numerous inquiries have been launched in an effort to acquire the needed information. The power selling agencies of the Department have pursued some of our studies in collaboration with other Federal agencies, or with State or municipal research organizations. We do not pretend to have found the unalterable answer to many of our questions, but our inquiry has been profitable because we have found some reliable clues to what the answers will be when they are found, and we have placed ourselves in a position to be among the first to get the facts when they are established. Also, our work has done more than merely provide guidance for the Department. We have given much assistance to industries, power distributors and to congressional committees and to individual members of Congress.

Among the post-war power planning activities of the Department in which the Division has participated are the following:

General.—The Division has worked with the war agencies on the problem of disposition of war power plants. Some of the large military establishments, constructed during the last few years, have been so located or have required electric power in such quantities that it has been necessary to provide fuel-operated generating plants to serve them. During the past year the Division has initiated discussions regarding the acquisition by the Federal power agencies of those plants which the armed services will not need after the war, as a means of supplementing and firming the power which is now generated at federally owned plants. Such coordination of Government facilities will result in better operations, sounder financial arrangements and lower rates. In many instances such fuel-operated plants can provide needed peaking or standby power which is now being purchased by the Government.

Central Valley project.—The Division participated in studies being conducted by the Department to work out the pattern for the administration and the extension of the multiple-purpose development in the Central Valley and to determine the best method for making available to the people of California its maximum benefits at a minimum cost.

Members of the staff participated, as committee members, in the discussions and studies of 13 of the 24 problems into which the study was divided. These problems included the use of Shasta power for war production, the scheduling of construction features, the reconversion of war plants in the area, the extension of the project to provide additional post-war opportunities, the allocation of cost on the project, and the power policies to be effectuated. Some of the reports resulting from these studies were completed during the year.

Missouri River development.—The Division reviewed programs for the development of the resources of the Missouri River Basin, prepared by the Bureau of Reclamation and the Corps of Engineers, and undertook independent studies looking toward the coordination of the several interests involved in this development. The problem of a unified development on this major stream is being given close consideration.

Pacific Northwest.—The Division participated in discussions and reviewed proposals regarding further development of the Columbia River and its tributaries. These efforts cover the economic development of the area as well as proposals directly concerned with specific river structures, and have as their objective the establishment of a diversified industry as the basis for a more self-sustaining and self-reliant region following cessation of specialized war activities. The Director of the Division, representing the Secretary of the Interior on the Bonneville Advisory Board, participated in the consideration of the problems of securing upstream storage on the Columbia and in the review of the studies of the Administration with respect to the development of industrial opportunities in the Northwest.

Colorado River area.—The Division engaged in a study of the further development of the Colorado River, and of the opportunities for marketing additional power in Arizona to assure this State its share in the resources of this stream, integrated with development of the Pacific Southwest as a whole. Studies of the relationship between the Salt River Valley Water Users' Association of Arizona and the United States and its effect upon post-war marketing possibilities were made in cooperation with the Bureau of Reclamation. The studies included the possibility of integrating these power facilities with the Colorado River power plants to produce a unified operating system, and make possible lower power rates.

ESTABLISHMENT OF SOUTHWESTERN POWER ADMINISTRATION

The work of the Division of Power, which is charged with supervising and coordinating all of the power activities of the Department, continued along the lines that have been dictated by the market-

ing problems resulting from increased tempo of war operations, as well as the concern for post-war conversion and expansion.

The principal work in the field of operations which confronted the Division during the year was the establishment of the Southwestern Power Administration. This agency was created along the lines of the Bonneville Power Administration to market power from dams in Arkansas, Texas, and Oklahoma. By Executive orders of the President, under his war powers and as a war measure the Pensacola Dam of Oklahoma's Grand River Dam Authority, previously taken over by the Government under the Federal Power Act, was turned over on September 1 to the Department of the Interior for operating purposes, and the Department was also designated as the agency to market the power to be generated at the Norfolk and Denison multiple-purpose dams, then rapidly being completed by the Corps of Engineers of the United States Army. The initial installations at these three dams total 130,000 kilowatts. They may ultimately have a combined total capacity of 320,000 kilowatts. The task of setting up the Southwestern Power Administration was undertaken directly by the Division of Power, which handled negotiations with other Federal agencies, helped to formulate basic policies and operating procedures, reviewed recommendations for key personnel, supervised the preparation of operating budgets, accounting procedures and negotiations and reviewed contracts for the sale of power from the three dams.

RATES AND RATE SCHEDULES

Rural Electrification Administration financed projects.—Rural residents served by Rural Electrification Administration financed power distributing projects have been benefited by the rapidly growing power developments of the Department through the availability of abundant power at low rates. Thirty-seven Rural Electrification Administration financed distributing agencies are being supplied directly with energy from facilities under the supervision of the Department at rates ranging down to 2.7 mills a kilowatt-hour.

Reduction in rates to these units, made possible by direct service from Department plants, have ranged from 3 to 27 percent in the case of four projects in the Wyoming-Colorado area, and from 15 to 20 percent in the case of those projects which were served by the Bonneville Power Administration. In addition, one of the conditions of the sale to a private power company in Texas of power from the Denison Dam assured the continuation of low rates to fifteen Rural Electrification Administration projects that are served by that company as long as the Denison power is available.

General.—Recent major rate studies reviewed by the Division included those covering proposed rates for power from Fort Peck Dam, the general rate revisions of the Bureau of Reclamation covering its Wyoming installations, the establishment of an irrigation pumping rate in Arizona by the Bureau of Reclamation and the establishment of new rates by the Bonneville Power Administration. Current studies include possible additional rates for industrial purposes by the Bonneville Power Administration and rates for the sale of power from the Denison and Norfolk projects by the Southwestern Power Administration.

CONTRACTS

Important contracts for the sale of power are reviewed by the Division before execution, in order that a uniform Departmental policy with respect to power sales may be maintained. Although the Division does not generally participate in the negotiations of power contracts, the services of the staff of the Division are made available to the negotiating agency in special circumstances. For instance, during the year the staff of the Division has participated in negotiations of the Bureau of Reclamation (*a*) for the sale of Central Valley project power to the Pacific Gas & Electric Co. as a wartime measure, (*b*) for the sale of Fort Peck project power to the Montana Power Co. as a wartime measure, (*c*) for the sale of Fort Peck project power to the Montana-Dakota Utilities Co. on a long-term basis, and (*d*) negotiations by the Southwestern Power Administration for the sale of power from the Denison Dam to the Texas Power & Light Co. as a wartime measure.

MISCELLANEOUS

The Division took an active part in determining the allocation of the costs of the Grand Coulee Dam among the several purposes for which the project was built. The allocation of these costs is an essential prerequisite to the determination of the rates at which the power from Grand Coulee will be sold.

Through the work of the Division in cooperation with the agencies of the United States that are consumers of power and with the Federal Power Commission the Department was able to help in obtaining substantial savings in power costs to the Government in a number of instances during the year. For example, by temporarily supplying 9,000 kilowatts of power from the Grand River Dam to the Government-owned aluminum plant at Jones Mills, Ark., a substantial saving to the Government was realized.

The Division was also able to render service to the Puerto Rico Water Resources Authority in connection with its priorities problems in the construction of the Caonillas Dam, a necessary link in the

power system that supplies military bases in Puerto Rico. Assistance was also given to the Territorial Government of the Virgin Islands in connection with the power supply for Benedict Field, and to the Oklahoma Ordnance Works, through the Southwestern Power Administration, in connection with the supply of power to that establishment.

The Division continued to participate in the activities incident to safeguarding the national power supply, including consideration of the need for a dim-out and other measures in the interests of conservation of resources for war.

Bonneville Power Administration

PAUL J. RAVER, Administrator

I. WAR AND PEACE

FEDERAL development of the tremendous water resources of the Columbia River was conceived by the Seventy-fifth Congress as a peacetime project for conservation and utilization of Pacific Northwest resources. During wartime, this program has been modified to meet the requirements of the Nation's first and biggest job—that of mobilizing its resources to win the war.

Under the impact of war the Bonneville Power Administration has telescoped 10 years of normal growth into a brief 5 years. It has delivered 6,472,326,000 kilowatt-hours for war needs during the fiscal year 1944, and has become one of the three largest power systems in the country, with a present energy output of approximately 10 billion kilowatt-hours per year. It has constructed a high-voltage, high-capacity transmission system which has grown from nothing in 1939 to 2,518 circuit miles as of June 30, 1944, involving an investment of about \$75,000,000. This system is marketing power from Bonneville-Grand Coulee generators which have increased in rated capacity from less than 100,000 kilowatts in 1939 to 1,316,400 kilowatts in 1944.

This forced growth has been possible largely because of the Administration's policy of developing Northwest power resources well in advance of immediate demands or specific markets. The value of this policy has been demonstrated time and again during the war emergency as mushrooming industries have steadily increased their production of critically needed war materials with Bonneville-Grand Coulee power.

During the fiscal year 1944, 5 Northwest aluminum reduction plants used Columbia River power in the production of nearly 600 million

pounds of aluminum, or approximately one-third of the Nation's entire output. Part of this aluminum ingot took final form in approximately 30,000 airplanes—again almost one-third of the entire national production for the year. Bonneville-Grand Coulee power was instrumental in turning out 258 ships, including 48 escort carriers, 62 tankers and fleet oilers, 32 Victory cargo ships, and 116 Liberty cargo ships. Less spectacular, but equally important, was the output of magnesium for planes and incendiary bombs, calcium carbide for ship welding, and ferrosilicon for steel—all from plants using Columbia River power. Thus, the Bonneville Power Administration has made a significant contribution to the Nation's ability to produce, a factor which has been vital to the work of winning the war.

Hydroelectric power from the Columbia River has established its right to be termed one of the Nation's most powerful tools of war production. It will play an equally vital role in the post-war development of the Pacific Northwest as a tool for the production of national and regional wealth. The power that today is flowing from Bonneville and Grand Coulee power plants over a vast region-wide network of high-tension transmission lines to huge war plants, will turn the wheels of the region's expanding industrial empire when the war is won.

With Allied victories on every battlefield during the past year casting a growing shadow of complete and devastating defeat over Axis hopes of world domination, attention began inevitably to shift from war to post-war problems, even while the Nation still was engaged in full war production. In the Pacific Northwest post-war thinking and planning has been dominated by a growing realization of one fundamental fact—the vast hydroelectric power resources of the Columbia River Basin hold the key to the future development of the region.

THE CONSERVATION PROGRAM

Multiple-purpose dams on inland waterways of the Nation are a most important means of carrying out the Federal Government program of conservation of natural resources. Bonneville Dam provides the means for impounding and controlling the waters of the Columbia River so that the river can be navigable for oceangoing vessels 180 miles inland, thus reducing transportation costs, prices for many products, and opening new markets for products of the Pacific Northwest. Behind Grand Coulee Dam is stored water for the reclamation and irrigation of 1 million acres of arid but fertile lands. Electric power produced at these Columbia River power plants further utilizes the inexhaustible water resources of the region by converting them into an energy form useful to the people for the production of more goods and

services to improve living standards, and to conserve other sources of energy, such as coal, wood and oil, which are subject to depletion and which should be conserved as much as possible for higher economic uses.

In carrying out these peacetime conservation policies, electric power produced at Bonneville and Grand Coulee Dams must first be used to meet the requirements of navigation, flood control, and irrigation. The remaining surplus power is marketed by the Bonneville Power Administration according to the basic policies laid down by Congress in the Bonneville Project Act of 1937.

REGIONAL LEADERSHIP

Since the enactment of these policies, the Bonneville Power Administration has worked toward and attained a position of recognized leadership in the development of the Pacific Northwest. The Administration in its 7 years of growth has fostered and encouraged Federal and State cooperation in the programming of regional developmental activities.

One of the most significant steps in this direction in the fiscal year 1944 was the formation on July 19, 1943, of the Northwest States Development Association, which is composed of the Governors of Idaho, Montana, Oregon, Washington, and Wyoming, and is aided by a technical committee of people responsible for the engineering and general planning functions in these States. The purpose of the Association is to further the balanced development of the Pacific Northwest and the Columbia Basin, with special emphasis on maximum utilization of the water resources of the region through irrigation, improved navigation, hydroelectric power development and flood control.

In its initial meeting the Association resolved that " * * * it shall be a further duty and responsibility of the Association to avail itself of the services and facilities of governmental, private and public agencies to the end that duplication of effort and consequent wasteful expense shall be avoided in the making of studies, the programming of activities and the carrying on of research."

Emphasizing the importance of the Pacific Northwest as a nerve center of industrial and commercial contact with the tremendous potential markets of the Far East, the association's initial report on a Columbia Basin program states: "It is believed that the rapid advance in Northwest development and production must continue. This advancement must be supported by a progressive and dynamic regional and national post-war reconstruction program. Post-war progress on the Pacific coast and in the basin will be especially great if the national reconstruction program is accompanied by world cooperation and trade. Confidence in the Northwest and its future are based on its geographic location, its great resources, and its people.

"The basic development projects of the Pacific Northwest—began before the war—have paid tremendous dividends in the war effort. They will continue to pay dividends after the war. The present stage of development is not sufficient to meet either war or post-war needs; continuing and progressive development is necessary."

THE REGIONAL PLAN

Following general endorsement by the Department of the Interior of the Bonneville Power Administration's proposals for a basin-wide program, representatives of the Administration met with the Five State Governors' Association and presented its program for consideration. This program included the Hungry Horse project in Montana, the Cabinet Gorge and Albeni Falls projects in northern Idaho, the Foster Creek and Snake River projects in Washington, the Umatilla Dam on the Columbia River and the Detroit project in Oregon.

On December 17, 1943, the Association issued its advance program report, which included all of the projects recommended for consideration by the Bonneville Power Administration, as well as a number of additional projects involving irrigation, navigation, and flood-control improvements. The program involves a total expenditure of approximately \$600,000,000 in war emergency and post-war projects.

Gearing its own plans to the multiple-purpose projects outlined in the Five-State Governors' report, the Bonneville Power Administration set up an advance construction program involving approximately \$100,000,000 in new transmission lines and substations designed to coordinate existing and proposed dams and load centers in a region-wide transmission grid system.

In round figures the combined programs outlined by the Northwest States Development Association and the Bonneville Power Administration will add about 1 million acres to the 3½ million acres of land now under irrigation in the region, and will provide improved water supplies for several hundred thousand more. It will increase regional power capacity by about 2 million kilowatts—adding about 60 per cent to the total regional capacity through new plants and upstream storage. The combined effects of the program will be broader and more diverse development; the establishment of new industries; new opportunities for employment—for business—for private and public enterprise and for investment.

In addition to increasing materially the real wealth of the region and the Nation, the program will have the effect of bringing about a greater maturity in the Northwest regional economy, particularly through a more advanced development and use of resources, as well as supplying a base for substantially larger population. It follows that public investment will induce at least as much more wealth—in

land, improvements, plant and communities—a prospective increase of some \$1,500,000,000.

PUBLIC WORKS AND REEMPLOYMENT

The immediate post-war program of asset-building, self-liquidating public works will produce some 50,000 construction jobs for returning servicemen and demobilized war workers. In operation the program will produce more than 100,000 continuing new jobs in agriculture, industry, and service, with an accompanying increase of some \$200,000,000 in annual income for the region. A program of the kind suggested will conceivably provide, if continued during the next 2 decades, a base for new regional population of at least 2 million. This will mean, averaging 4 persons to the farm home, 200,000 people on 50,000 new farms; 800,000 people dependent upon 250,000 new industrial jobs, and approximately 1,000,000 people dependent upon 350,000 new service jobs.

Testimony presented by the Bonneville Administrator before the Senate Committee on Postwar Economic Policy and Planning and before the House Committee on Irrigation and Reclamation during the past fiscal year outlined clearly the Administration's fundamental status as a regional developmental agency. Both reports stressed the importance of a balanced and unified program of development in the Columbia River drainage basin as one of the major factors in providing for maximum postwar employment in the Pacific Northwest.

In accordance with the Presidential Executive Order 9384 of October 4, 1943, and to facilitate and coordinate Bonneville Power Administration consideration of a unified advance program, a special committee on advanced planning, programming, and budgeting was formed within the Administration on November 20, 1943. The functions assigned to the committee were the coordination of the Administration's programs and plans with various governmental and regional interests, effectuating necessary technical staff assignments, review and coordination of data and reports prepared by the staff in accordance with such assignments, and presentation of unified recommendations to the executive committee of the Bonneville Power Administration for consideration and review.

The advisory committee was directed to place particular emphasis upon the formulation of unified basin-wide power system development plans for both the wartime and the post-war period. The committee was also directed to give particular attention to the coordination of the administration's advance plans and programs with those of other agencies of the Department, as well as other Federal, State, and local governmental agencies and interests.

During the fiscal year 1944, the committee has successfully brought together those concerned in various advance programming efforts in

"The basic development projects of the Pacific Northwest—began before the war—have paid tremendous dividends in the war effort. They will continue to pay dividends after the war. The present stage of development is not sufficient to meet either war or post-war needs; continuing and progressive development is necessary."

THE REGIONAL PLAN

Following general endorsement by the Department of the Interior of the Bonneville Power Administration's proposals for a basin-wide program, representatives of the Administration met with the Five State Governors' Association and presented its program for consideration. This program included the Hungry Horse project in Montana, the Cabinet Gorge and Albeni Falls projects in northern Idaho, the Foster Creek and Snake River projects in Washington, the Umatilla Dam on the Columbia River and the Detroit project in Oregon.

On December 17, 1943, the Association issued its advance program report, which included all of the projects recommended for consideration by the Bonneville Power Administration, as well as a number of additional projects involving irrigation, navigation, and flood-control improvements. The program involves a total expenditure of approximately \$600,000,000 in war emergency and post-war projects.

Gearing its own plans to the multiple-purpose projects outlined in the Five-State Governors' report, the Bonneville Power Administration set up an advance construction program involving approximately \$100,000,000 in new transmission lines and substations designed to coordinate existing and proposed dams and load centers in a region-wide transmission grid system.

In round figures the combined programs outlined by the Northwest States Development Association and the Bonneville Power Administration will add about 1 million acres to the 3½ million acres of land now under irrigation in the region, and will provide improved water supplies for several hundred thousand more. It will increase regional power capacity by about 2 million kilowatts—adding about 60 percent to the total regional capacity through new plants and upstream storage. The combined effects of the program will be broader and more diverse development; the establishment of new industries; new opportunities for employment—for business—for private and public enterprise and for investment.

In addition to increasing materially the real wealth of the region and the Nation, the program will have the effect of bringing about a greater maturity in the Northwest regional economy, particularly through a more advanced development and use of resources, as well as supplying a base for substantially larger population. It follows that public investment will induce at least as much more wealth—in

land, improvements, plant and communities—a prospective increase of some \$1,500,000,000.

PUBLIC WORKS AND REEMPLOYMENT

The immediate post-war program of asset-building, self-liquidating public works will produce some 50,000 construction jobs for returning servicemen and demobilized war workers. In operation the program will produce more than 100,000 continuing new jobs in agriculture, industry, and service, with an accompanying increase of some \$200,000,000 in annual income for the region. A program of the kind suggested will conceivably provide, if continued during the next 2 decades, a base for new regional population of at least 2 million. This will mean, averaging 4 persons to the farm home, 200,000 people on 50,000 new farms; 800,000 people dependent upon 250,000 new industrial jobs, and approximately 1,000,000 people dependent upon 350,000 new service jobs.

Testimony presented by the Bonneville Administrator before the Senate Committee on Postwar Economic Policy and Planning and before the House Committee on Irrigation and Reclamation during the past fiscal year outlined clearly the Administration's fundamental status as a regional developmental agency. Both reports stressed the importance of a balanced and unified program of development in the Columbia River drainage basin as one of the major factors in providing for maximum postwar employment in the Pacific Northwest.

In accordance with the Presidential Executive Order 9384 of October 4, 1943, and to facilitate and coordinate Bonneville Power Administration consideration of a unified advance program, a special committee on advanced planning, programming, and budgeting was formed within the Administration on November 20, 1943. The functions assigned to the committee were the coordination of the Administration's programs and plans with various governmental and regional interests, effectuating necessary technical staff assignments, review and coordination of data and reports prepared by the staff in accordance with such assignments, and presentation of unified recommendations to the executive committee of the Bonneville Power Administration for consideration and review.

The advisory committee was directed to place particular emphasis upon the formulation of unified basin-wide power system development plans for both the wartime and the post-war period. The committee was also directed to give particular attention to the coordination of the administration's advance plans and programs with those of other agencies of the Department, as well as other Federal, State, and local governmental agencies and interests.

During the fiscal year 1944, the committee has successfully brought together those concerned in various advance programming efforts in

the joint consideration of system extension projects; a long-range system development program and a 3-year and a 6-year advance construction program. The committee has also made preliminary studies for the potential use of surplus war materials, equipment and plant by Bonneville Power Administration, public power distributors and industries in the region.

PACIFIC NORTHWEST OPPORTUNITIES

Closely related to the committee's work and a significant contribution to advance regional planning was the publication by the Bonneville Power Administration of the Pacific Northwest Opportunities report. The report, although of a preliminary nature, presented comprehensive flow charts and detailed information on a wide variety of industrial and agricultural possibilities in the Pacific Northwest, together with pertinent comment on raw materials, power supply, and geographical particulars.

Publication of the report met with immediate and widespread acclaim. Nation-wide press comment, as well as complimentary letters from leaders of industry and business, educators and other professional people, members of Federal, State, and local governmental agencies, indicated that the report was not only filling an urgent need for information of this type on the Pacific Northwest but was serving as a definite stimulus to interest in the potentialities of the region.

Pointing out the purpose of the report as well as the purpose of the Bonneville Power Administration program, the preface of the report says: "The underlying aim for the whole region and for all the agencies that serve it is to create a stronger and better balanced economy by raising it further from its status of a mere colonial producer of raw materials. The wastefulness of unused rich resources must be changed to wealth, productively used. The wantonly expensive system of shipping raw materials 3,000 miles east and resulting finished products 3,000 miles back to the west must be eliminated. A more reasonable economy will, it is hoped, result from this study, from similar studies by others and by construction programs."

Referring to the place of power in the program, the preface states: "Hydroelectric power is an outstanding resource in the Pacific Northwest. It is a product of the river-development project. It is the means of enlarging the benefits of all the other phases of the project. It is, besides, the principal key to the development and use of other regional resources. Power irrigation and drainage pumping facilitates reclamation. Power widens the usefulness of both farmer and crops to an indefinite horizon. Power draws minerals from the earth; becomes an essential ingredient in electro-manufacturing and cuts down the cost of other manufacturing. Power supplies terminal, storage, and distributing service in commerce. Power fosters the growth of

many diverse industries and, available everywhere, distributes them throughout the region. Power raises the level of living in city and country. Power is the invisible magic that flows in abundance from river development and leads to regional development."

Further presenting the value of the relationship of various programs and the need for cooperation, the preface says: "Both power development and regional development, so closely related, are matters of deep concern to a number of Federal agencies, States, communities, and private enterprise. All plans must be formulated on a joint or cooperative basis if they are to be comprehensive and realistic. This presentation of a Bonneville Power Administration program could hardly be complete or clear without some indications of other closely related programs for regional development. Similarly, the programs of other agencies cannot be complete or clear without recognition of the related power program of Bonneville.

All the basic plans must be brought together and properly correlated and the interest and enthusiasm of all agencies must be assured for a really effective program for regional development.

The report offers a constructive contribution to regional planning and development programs for future transition from the current war period to peace.

Several sections are devoted to the industrial opportunities offered in the fields of railroad electrification, farm utilization of power, electric steam generation, and electric house heating. In addition to the manufacturing and distribution possibilities offered, each of the foregoing represents a considerable power load building potential.

ADVANCE MARKETING STUDIES

Continuing studies are being carried on to elaborate the material contained in the report. As an example, tests and investigations of electrically heated houses were participated in throughout the year by the administration's utilization staff. Activities were centered at Longview, Wash., where a substantial number of privately-owned homes have been successfully heated by electricity for the past 3 years. During the calendar year 1943 an average of 11,000 kilowatt-hours of energy costing \$73 per home was consumed for heating service in the Longview homes. Information gathered at Longview and submitted to the U. S. Army Engineers was the basis for selection of electric heat for another project of 1,800 houses in this region. The reduction of war loads will stimulate activity by power distributors to expand the domestic market, and facts indicate that electric house heating will triple annual domestic energy consumption. It is estimated that 25,000 houses should be electrically heated in this region within 10 years, representing a heating load of approximately 125,000 kilowatts and marketing 275 million kilowatt-hours annually. Negotiations

have been carried on during the year with the War Production Board to release the materials for electric heaters to be used in new permanent-type houses in the Northwest.

FUEL CONSERVATION

The possibilities discussed in the report for the use of hydroelectricity in the generation of steam as a fuel-oil replacement have passed the study phase and are approaching commercial reality. The markets opening for the sale of power for this use have been vastly accelerated by the requirements for fuel oil in the prosecution of the war.

A major user of fuel oil for steam generation for some time has been the pulp and paper industry, although other and smaller industries are now consuming increasing quantities due to the depletion of other forms of fuels. The estimated amount of heavy fuel oil consumed in Washington and Oregon alone during fiscal 1944 was 13 million barrels. Of this, some 440,000 barrels were consumed in power generation by electric utilities, leaving a balance of approximately 12,790,000 barrels consumed by industry. In heating value 440,000 barrels is the equivalent of 15,400,000 kilowatt-hours. War's demands, higher production cost, and the expanding use of oil as a raw material for manufacture are all factors tending to bring steam generation by means of electric boilers into close competition with other forms of heat production. This is especially true when consideration is given to the substantial amounts of secondary power available which can be sold at a lower cost than is provided by the Bonneville firm power wholesale rate of \$17.50 per kilowatt-year. Based on recent inquiries of the pulp and paper industry and data collected from field investigations, it has been estimated that if all present oil consumption by this industry for the generation of processed steam were replaced by electric power, a market of 450,000 kilowatts of secondary power would be created.

As the foregoing examples indicate, it becomes obvious that wider use of hydroelectricity for domestic and industrial heating purposes as well as for such power consuming purposes as railroad electrification will induce substantial savings in exhaustible wood, coal, and oil supplies, for which science is constantly finding new and higher uses.

CUT-BACKS AND CONVERSION

Late in December 1943 the Administration began to be confronted with threatened cut-backs in production of the northwest war industries it was serving, particularly in the case of aluminum plants. These cut-backs emphasized the need for immediate provision for additional advance marketing studies, in order to be better prepared for remarketing power released by war industries when curtailments occur. The Administration's 1945 budget had been prepared on the assumption that the war would require full war production throughout the fiscal

year 1945. However, some curtailments in production began in December 1943 and as yet no action had been taken on the advance planning budget, which provided for marketing studies to meet situations of this nature. It was concluded, after consultation with representatives of the Department and endorsement by the Bonneville Advisory Board at a meeting held on March 9, 1944, to present an immediate request to the Bureau of the Budget and the Congress for a supplemental appropriation for this purpose to be added to the administration's 1945 fiscal year budget.

The Bureau of the Budget and the President recommended a supplemental appropriation for this purpose of \$254,000. While this recommendation did not reach the House in time for action on the measure, the House committee had indicated general sympathy to the proposal and after hearings the Senate committee and the Senate approved addition of this amount to the 1945 budget. However, in conference the amount was compromised and the sum of \$127,000 was finally approved for this purpose.

In addition to endorsing the supplemental appropriation for advance marketing studies, the Bonneville Advisory Board at its meeting of March 9 recommended reinstatement of priorities for Grand Coulee Unit No. 7 and endorsed the general program for upstream storage development as worked out with the States of Idaho and Montana. Proceedings of this meeting reiterated in large part the findings of the Advisory Board at its earlier meeting held October 11 and 12, 1943.

REGIONAL ADVISORY COUNCIL

Another major development of the year was a decision to proceed with appointment of a group of regional consultants with whom the Administrator could confer regarding regional policy and the developmental program. Arrangements were finally completed for designation of the regional consultants with the endorsement of the Secretary of the Interior and the Advisory Board. The first meeting of the group, comprising 20 regional consultants from the 4 States of Oregon, Washington, Idaho, and Montana, was held in Portland on March 31, 1944.

A general program report was presented by the Bonneville staff outlining the objectives of the Administration and the plans suggested for developmental activity. The remainder of the meeting was devoted to review and critical study of the Pacific Northwest Opportunities report.

A second meeting of the group was held on June 5 and 6, at which time such specific phases of the program as industrial load building and electric house heating were discussed. It was determined that extension of the consultant's deliberations might be carried on by

smaller groups in the localities represented and their findings as subjects for discussion at periodic meetings of the major group.

II. SHIFT FROM CONSTRUCTION TO OPERATIONS PROGRAM

The fiscal year 1944 marked a turning point in the history of the Bonneville Power Administration. After 7 years of intensive construction activity the Administration had completed a basic transmission grid system comprising more than 2,500 miles of high voltage lines. During the year the Bonneville powerhouse was brought to completion by the United States Army Engineers with the addition of generators 9 and 10, and the sixth, seventh, and eighth generators were installed by the Bureau of Reclamation in the west power house at Grand Coulee Dam.

With completion of these major generating and transmission facilities, and with further construction, excepting certain emergency projects, curtailed by the war, there has been a sharp swing toward operating, research and marketing phases of the Administration's activities. Rapid expansion of facilities to meet the needs of war industries, the steady and accelerating demand of the armed forces upon personnel, and other exigencies of the emergency made it necessary to maintain great flexibility within the Administration. Its adaptability to quickly changing conditions became a real necessity. Toward this end a general realignment of the Bonneville organization was effected by Administrative Order No. 59, dated November 4, 1943.

ADMINISTRATION REALIGNMENT

The order gave organizational emphasis to the power system operations by establishing a Division of Operations and Maintenance. It formerly was one of five sections in the Engineering Division, combining the remaining four sections of the former Engineering Division into a Division of Engineering and Construction. Both divisions are now included in the Branch of Engineering and Operations, under the supervision of the chief engineer. The new strong, efficient engineering organization, streamlined and adapted to the major tasks of operations, maintenance and construction which lie ahead.

Similarly, the former Market Development section, which was one of five sections in the System Planning and Marketing Division, was advanced in status to the Division of Industrial and Resources Development. Other functions of the former marketing division were combined in the Division of Power Sales and Service. The new divisions, which are figuring importantly in preparations for war activities, are included in the Branch of Power Management.

A new Branch of Fiscal and Administrative Management was established under the supervision of a controller to embrace a Division of Finance and Accounts, including all budgetary, financial, and accounting functions, a Division of Administrative Services to embrace service functions, and an Organization and Procedure Staff to conduct management studies.

Finally, the executive committee, composed of the branch managers, general counsel, and administrative staff, was formally established to guide and coordinate matters of policy and programming, with responsibility for current administration being delegated largely to the branch and division chiefs.

The new plan of organization was resolved through analyses made by staff members of the administration in cooperation with members of the Department of the Interior, taking into consideration the three-fold nature of the Bonneville Power Administration as an operating utility, a government business organization and a regional service agency.

III. WARTIME OPERATIONS

During the fiscal year 1944, maximum hourly generation supplied by the Bonneville and Grand Coulee plants was 1,355,000 kilowatts as contrasted to 841,000 kilowatts during fiscal year 1943.

The comparison is indicative of the pressure of regional war needs on the administration's transmission system. As the war has progressed it has become necessary to operate all facilities at capacity, and in many instances with heavy overloads, to supply these needs. For example, the Grand Coulee generators have operated continuously for extended periods of time with approximately 20 percent overload and Bonneville generators with approximately 10 percent overload. During the greater part of the year both plants have operated without reserves.

The low water months of this year marked the first period when the entire flow of the Columbia River was utilized through the Bonneville generators. From September 14, 1943, until April 5, 1944, with minor exceptions of a few hours' duration, no water was spilled at Bonneville Dam. During this period, too, the natural flow at Bonneville was augmented, in amounts as high as 28,000 second-feet, by storage water released from Grand Coulee Reservoir. Although the scheduling of such releases was vastly complicated by conditions along the river which affected the arrival time and quantity delivered over wide limits, the operation was highly successful in increasing the generating capability of the Bonneville plant and relieving the necessity for transmitting large blocks of Grand Coulee power over lines that were already heavily loaded.

WARTIME POWER LOADS

Transmission facilities, also, have operated at capacity throughout the year, and in a number of instances, under conditions of extreme overload. A noteworthy example is the No. 1 Covington-Coulee 230,000-volt line which has carried, for weeks at a time, over 210,000 kilowatts of power, often reaching peaks of 230,000 kilowatts, an amount greatly in excess of its normal operating limit of 175,000 kilowatts. Transformer banks in many of the system's substations have been repeatedly loaded beyond rated capacity. This condition has required the installation of forced-air-cooling, portable fans and temporary or semipermanent water sprays in order to permit continuous overloads as high as 60 percent above normal ratings in some instances.

Transmission costs have been reduced during the year, in spite of the strains placed on personnel and equipment. Total transmission expense has increased only 12.8 percent over the fiscal year 1943, while the transmission expense per kilowatt-hour delivered has decreased 33.4 percent. Unit operating and maintenance costs have also shown a decrease.

By operating all facilities at maximum capacity during the past fiscal year, the Bonneville Power Administration has been able to meet not only all power demands of its own war customers but to supply other utility systems in the Northwest Power Pool with 1,810,602,507 kilowatt-hours for meeting requirements of their own systems. This was more than double the previous year's deliveries to other utility systems in the Northwest Power Pool.

THE NORTHWEST POWER POOL

But the Administration's contribution to the effectiveness and success of the Northwest Power Pool during fiscal year 1944 cannot be measured entirely in terms of kilowatt-hours delivered. The Administration's far-sighted policies of establishing interconnections with adjoining utilities and providing transmission and generating facilities in anticipation of war and peacetime needs have contributed immeasurably to the present strength and capability of the power pool. The western group of utilities, in particular, would have been hampered greatly in providing power to wartime loads had the Administration's policies not been followed. The policies were formulated in consultation with the War Production Board and voluntarily placed into effect in advance of Order No. L94 of the War Production Board which applied to all utilities of the United States. Even without curtailment of oil-fired generation, the individual capabilities of practically every utility would have been inadequate to serve its loads

without assistance, directly or indirectly, from the Bonneville-Grand Coulee system.

Three interconnections with other utilities were added during the fiscal year, two at 115 kilovolts with the Pacific Power & Light Co. at Vernita, and Pasco, Wash., and one at 13.2 kilovolts with the Northwestern Electric Co. at J. D. Ross substation. The first two, which stem from the acquisition of all Pacific Power & Light Co. property in the vicinity of Hanford, Wash., by the United States Army, replace the Hanford interconnection as a point of delivery to the company's main system. This interconnection continues in effect, however, as a point of delivery to the Washington Water Power Co.-Pacific Power & Light Co. combination via the 115-kilovolt lines acquired by the Army.

The third interconnection was made at the request of the Northwestern Electric Co. to supply additional hydro energy to that system for displacing fuel-generated energy in the Portland area. Preparations for a fourth interconnection with the Portland General Electric Co. at St. Johns substation at 11.5 kilovolts were also under way at the close of the year. Both of these installations are considered temporary, pending completion by the Portland General Electric Co. of another interconnection with the Administration's 115-kilovolt system near Harborton (West Portland), Oreg.

Approximately 50 percent of the electric energy consumed in the 5 northwest States during the past fiscal year was generated at the Bonneville and Grand Coulee power plants and distributed over the Federal transmission system. At the end of the year the peaking capacity of the Administration's system was approximately 50 percent of the combined 5-State hydro generating capacity, and 44 percent of the total generating capacity. The use of Columbia River energy for displacing oil-fired steam energy in the Seattle and Portland areas saved approximately 3,500,000 barrels of critical fuel oil during the year. Without these contributions by the Administration, the effectiveness of the power pool would have been seriously impaired.

Tabulations of energy receipts and deliveries which follow indicate the scope of the Administration's contribution to the effectiveness of the power pool's operation through the use of interconnections during this fiscal year. It should be noted in the tabulation, "Power Pool Operations," that the amount of energy delivered to the adjoining utilities for their own use is listed separately. The amounts scheduled in the column designated "Other" include energy transferred to the Bonneville Power Administration customers and energy losses in connection with such transfers.

WARTIME POWER LOADS

Transmission facilities, also, have operated at capacity throughout the year, and in a number of instances, under conditions of extreme overload. A noteworthy example is the No. 1 Covington-Coulee 230,000-volt line which has carried, for weeks at a time, over 210,000 kilowatts of power, often reaching peaks of 230,000 kilowatts, an amount greatly in excess of its normal operating limit of 175,000 kilowatts. Transformer banks in many of the system's substations have been repeatedly loaded beyond rated capacity. This condition has required the installation of forced-air-cooling, portable fans and temporary or semipermanent water sprays in order to permit continuous overloads as high as 60 percent above normal ratings in some instances.

Transmission costs have been reduced during the year, in spite of the strains placed on personnel and equipment. Total transmission expense has increased only 12.8 percent over the fiscal year 1943, while the transmission expense per kilowatt-hour delivered has decreased 33.4 percent. Unit operating and maintenance costs have also shown a decrease.

By operating all facilities at maximum capacity during the past fiscal year, the Bonneville Power Administration has been able to meet not only all power demands of its own war customers but to supply other utility systems in the Northwest Power Pool with 1,810,602,507 kilowatt-hours for meeting requirements of their own systems. This was more than double the previous year's deliveries to other utility systems in the Northwest Power Pool.

THE NORTHWEST POWER POOL

But the Administration's contribution to the effectiveness and success of the Northwest Power Pool during fiscal year 1944 cannot be measured entirely in terms of kilowatt-hours delivered. The Administration's far-sighted policies of establishing interconnections with adjoining utilities and providing transmission and generating facilities in anticipation of war and peacetime needs have contributed immeasurably to the present strength and capability of the power pool. The western group of utilities, in particular, would have been hampered greatly in providing power to wartime loads had the Administration's policies not been followed. The policies were formulated in consultation with the War Production Board and voluntarily placed into effect in advance of Order No. L94 of the War Production Board which applied to all utilities of the United States. Even without curtailment of oil-fired generation, the individual capabilities of practically every utility would have been inadequate to serve its loads

without assistance, directly or indirectly, from the Bonneville-Grand Coulee system.

Three interconnections with other utilities were added during the fiscal year, two at 115 kilovolts with the Pacific Power & Light Co. at Vernita, and Pasco, Wash., and one at 13.2 kilovolts with the Northwestern Electric Co. at J. D. Ross substation. The first two, which stem from the acquisition of all Pacific Power & Light Co. property in the vicinity of Hanford, Wash., by the United States Army, replace the Hanford interconnection as a point of delivery to the company's main system. This interconnection continues in effect, however, as a point of delivery to the Washington Water Power Co.-Pacific Power & Light Co. combination via the 115-kilovolt lines acquired by the Army.

The third interconnection was made at the request of the Northwestern Electric Co. to supply additional hydro energy to that system for displacing fuel-generated energy in the Portland area. Preparations for a fourth interconnection with the Portland General Electric Co. at St. Johns substation at 11.5 kilovolts were also under way at the close of the year. Both of these installations are considered temporary, pending completion by the Portland General Electric Co. of another interconnection with the Administration's 115-kilovolt system near Harborton (West Portland), Oreg.

Approximately 50 percent of the electric energy consumed in the 5 northwest States during the past fiscal year was generated at the Bonneville and Grand Coulee power plants and distributed over the Federal transmission system. At the end of the year the peaking capacity of the Administration's system was approximately 50 percent of the combined 5-State hydro generating capacity, and 44 percent of the total generating capacity. The use of Columbia River energy for displacing oil-fired steam energy in the Seattle and Portland areas saved approximately 3,500,000 barrels of critical fuel oil during the year. Without these contributions by the Administration, the effectiveness of the power pool would have been seriously impaired.

Tabulations of energy receipts and deliveries which follow indicate the scope of the Administration's contribution to the effectiveness of the power pool's operation through the use of interconnections during this fiscal year. It should be noted in the tabulation, "Power Pool Operations," that the amount of energy delivered to the adjoining utilities for their own use is listed separately. The amounts scheduled in the column designated "Other" include energy transferred to the Bonneville Power Administration customers and energy losses in connection with such transfers.

WARTIME POWER LOADS

Transmission facilities, also, have operated at capacity throughout the year, and in a number of instances, under conditions of extreme overload. A noteworthy example is the No. 1 Covington-Cincinnati 100,000-volt line which has carried, for weeks at a time, over 2,000 kilowatts of power, often reaching peaks of 230,000 kilowatts—amount greatly in excess of its normal operating limit of 57 kilowatts. Transformer banks in many of the system's substations have been repeatedly loaded beyond rated capacity. This condition has required the installation of forced-air-cooling, portable fans, temporary or semipermanent water sprays in order to permit continuous overloads as high as 60 percent above normal ratings in many instances.

Transmission costs have been reduced during the year, in spite of the strains placed on personnel and equipment. Total transmission expense has increased only 12.8 percent over the fiscal year 1943, but the transmission expense per kilowatt-hour delivered has decreased 33.4 percent. Unit operating and maintenance costs have also shown a decrease.

By operating all facilities at maximum capacity during the past fiscal year, the Bonneville Power Administration has been able to meet not only all power demands of its own war customers but to supply other utility systems in the Northwest Power Pool with 1,500,000 kilowatt-hours for meeting requirements of their own systems. This was more than double the previous year's deliveries to other utility systems in the Northwest Power Pool.

THE NORTHWEST POWER POOL

But the Administration's contribution to the effectiveness and success of the Northwest Power Pool during fiscal year 1944 can be measured entirely in terms of kilowatt-hours delivered. The Administration's far-sighted policies of establishing interconnections with adjoining utilities and providing transmission and generating facilities in anticipation of war and peacetime needs have contributed measurably to the present strength and capability of the power pool. The western group of utilities, in particular, would have been hampered greatly in providing power to wartime loads had the Administration's policies not been followed. The policies were formulated in consultation with the War Production Board and voluntarily put into effect in advance of Order No. L94 of the War Production Administration which applied to all utilities of the United States. Even without the tailment of oil-fired generation, the individual capabilities of practically every utility would have been inadequate to serve its own

hout assistance, directly or indirectly, from the Bonneville-Grand Coulee system.

Three interconnections with other utilities were added during the fiscal year, two at 115 kilovolts with the Pacific Power & Light Co. at Armita, and Pasco, Wash., and one at 13.2 kilovolts with the Northwestern Electric Co. at J. D. Ross substation. The first two, which result from the acquisition of all Pacific Power & Light Co. property in the vicinity of Hanford, Wash., by the United States Army, replace the Hanford interconnection as a point of delivery to the company's main system. This interconnection continues in effect, however, as a point of delivery to the Washington Water Power Co.-Pacific Power & Light Co. combination via the 115-kilovolt lines acquired by the Army.

The third interconnection was made at the request of the Northwestern Electric Co. to supply additional hydro energy to that system for displacing fuel-generated energy in the Portland area. Preparations for a fourth interconnection with the Portland General Electric Co. at St. Johns substation at 11.5 kilovolts were also under way at the close of the year. Both of these installations are considered temporary, pending completion by the Portland General Electric Co. of another interconnection with the Administration's 115-kilovolt system near Harborton (West Portland), Oreg.

Approximately 50 percent of the electric energy consumed in the Northwest States during the past fiscal year was generated at the Bonneville and Grand Coulee power plants and distributed over the Federal transmission system. At the end of the year the peaking capacity of the Administration's system was approximately 50 percent of the combined 5-State hydro generating capacity, and 44 percent of the total generating capacity. The use of Columbia River energy for displacing oil-fired steam energy in the Seattle and Portland areas saved approximately 3,500,000 barrels of critical fuel oil during the year. Without these contributions by the Administration, the effectiveness of the power pool would have been seriously impaired.

Tabulations of energy receipts and deliveries which follow indicate the scope of the Administration's contribution to the effectiveness of the power pool's operation through the use of interconnections during this fiscal year. It should be noted in the tabulation, "Power Pool Operations," that the amount of energy delivered to the adjoining utilities for their own use is listed separately. The amounts scheduled in the column designated "Other" include energy transferred to the Bonneville Power Administration customers and energy losses in connection with such transfers.

¹ The other members of the Northwest Power Pool—Northwestern Electric Co. and power systems in Utah, Montana, and Idaho—are not directly interconnected with the Bonneville-Grand Coulee system.

IV. POWER SALES

The Bonneville Power Administration continued to supply power to a major share of the Pacific Northwest's war loads during the past fiscal year, approximately 89 percent of all power generated at Bonneville and Grand Coulee dams going either directly to the Administration's war customers, or to other utility systems in the region to help them meet their war loads.

By June 30, 1944, the Administration had in effect 91 executed power and exchange contracts, with a total over-all contract demand of 1,054,612 kilowatts. This represented an increase of 143,860 kilowatts during the fiscal year. On a contract basis, these demands were divided as follows:

Industrial sales of 894,600 kilowatts; military establishments 23,250 kilowatts; cooperatives 9,170 kilowatts; public or peoples' utility districts 48,200 kilowatts; municipalities, 5,725 kilowatts; and privately owned utility companies 73,667 kilowatts. In addition two municipalities and two private utilities are being served under exchange contracts.

THE PUBLIC POWER MARKET

Three new public-owned power agencies signed contracts during the year, and six new contracts were executed with existing public-agency customers of the Bonneville Power Administration. This brought the total of "public agency" contracts in force at the end of the fiscal year to 54 with a total contract demand of 63,095 kilowatts as compared with a total of 59,685 a year ago. While this increase in contract demand is comparatively small, a better indication of

public-agency growth is gained by a comparison of power consumption figures for the two years. Continuing the upward trend of previous years, the sale of power to publicly owned and operated power distribution agencies, excluding Tacoma and Seattle, by the Bonneville Power Administration increased 60.2 percent, rising from a total of 176,723,021 kilowatt-hours in fiscal 1943 to 283,081,561 kilowatt hours in fiscal 1944.

Public utility districts led the field in increased power use with total 1944 purchases from the Bonneville Administration of 214,923,-990 kilowatt-hours at a cost of \$607,350, as compared with 1943 figures of 123,518,776 kilowatt-hours at a cost of \$364,546. Sales to co-operatives rose from 27,467,193 kilowatt-hours to 37,671,071, while revenues increased from \$122,839 in fiscal 1943 to \$162,756. Sales to municipalities, exclusive of Tacoma and Seattle, climbed from 25,737,-052 in 1943 to 30,486,500 in 1944, and revenue received increased from \$99,212 to \$113,256.

The cumulative list of public agency contracts follows:

Contracts with public agencies as of June 30, 1944

Name of purchaser	Contract demand in kilowatts	Date of execution
I. Public or peoples' utility districts:		
Central Lincoln 1	(1)	Feb. 25, 1942

¹ Operating but at present not served by B. P. A.² No contract demand specified.³ Operating but at present has only an emergency service connection with B. P. A.⁴ Not yet in operation.⁵ Served via W. W. P. Co.⁶ Served (at Condit point of delivery) via P. P. & L. Co.⁷ Total of three points of delivery, only one of which is energized or constructed, viz: Condit, 100 kilowatts, North Dalles, 125 kilowatts; Goldendale, 350 kilowatts.⁸ Served via P. P. & L. Co. at White Salmon River point of delivery, but directly by B. P. A. at North Bonneville and Bonneville dam delivery points.⁹ Served via P. G. E. Co.¹⁰ Served via C. O. P. Co.¹¹ Interchange.¹² Served via P. P. & L. Co.¹³ Not energized; completion of line to connect with Eugene substation deferred for duration.**PROGRESS OF PUBLICLY OWNED AGENCIES**

The trend toward post-war thinking and planning was evidenced during the year by the increased activity on the part of the Northwest's publicly owned and operated power distribution agencies. A significant move during the year was the concerted effort on the part of the city of Seattle and the public utility districts in the Puget Sound Power & Light Co.'s service area to purchase the company's distribution properties on a system-wide basis. The public agencies requested the Bonneville Power Administration to participate by acquiring the major generating and transmission properties, and by serving as negotiating agent for the transaction.

In February 1943, the public utility districts and the city of Seattle authorized the Bonneville administrator to act as negotiator for purchase of the properties to be acquired by the public utility districts and the city. The Secretary of the Interior also authorized the administrator to negotiate for the purchase of the company's major

generation and transmission facilities, contingent on congressional approval and appropriation of funds.

An offer of \$90,000,000 for the Puget properties was submitted on behalf of the public utility districts, the city of Seattle, and the Bonneville Power Administration to the company's board of directors on May 18, 1944. The offer was rejected on April 13, 1944, on the grounds that it was not made by an agency giving proof that it had the legal power to acquire such properties and evidence of its ability to finance the acquisition. •

V. CONSTRUCTION PROGRESS

The Branch of Engineering and Operations continued to prosecute vigorously its curtailed wartime construction program during the year. In spite of handicaps imposed by wartime restrictions, the critical shortage of skilled manpower, and manufacturing delays, all energization dates were met promptly and, in many instances, well in advance of the customers' requirements.

Transmission-line facilities placed in service during the year included Spokane-Trentwood Line No. 2, Willamina-Grand Ronde Line, Boyer-Tillamook Line, Salem Alumina Line, Longview-Columbia Way Line No. 2, and Bradford Island Crossing No. 4.

New substations were placed in service at Tillamook and the Salem Alumina plant; switching stations were placed in service at Pasco and Willamina; and the Earlington switching station was removed and reconstructed at South Renton.

Major additions to substations during the year included: Transformers at Spokane, Tillamook, and Bayview; a temporary transformer at the Salem Alumina plant; transformer cooling fans at Midway and St. Johns; shortwave radio stations at Covington and Midway; construction of 230-kilovolt line terminal facilities at Midway for the Hanford No. 1 and No. 2 lines; 230-kilovolt and 115-kilovolt switchgear additions at Midway; installation of synchronous condensers at Spokane and Troutdale; and installation of static condensers at Alcoa.

Major projects still under construction at the close of the fiscal year included a second 230,000-volt, 183-mile line from Grand Coulee dam to Covington, Wash., near Seattle; a second 230-kilovolt transformer bank at the Midway substation, and condenser installations at two other major substations.

The following tabulation shows, by comparison with fiscal year 1943, the system additions constructed during fiscal year 1944. Generating facilities installed at Bonneville and Grand Coulee by the United States Engineers and the Bureau of Reclamation, respectively, are included for completeness.

Facilities placed in service

Type	Installed at end of fiscal year 1943	Fiscal year 1944		Total
		Added	Retained	
Generation (kilovolt-amperes):				
Grand Coulee (including house unit).....	484,000	7,324,000		
Bonneville.....	410,400	108,000		
Total.....	894,400	432,000		
Transmission lines (circuit miles):				
230 kilovolts.....	1,053.2			
115 kilovolts.....	1,078.5	45.4		
69 kilovolts and lower.....	323.0	37.6		
Total.....	2,434.7	83.2		
Substation facilities:				
Transformation (kilovolt-amperes).....	2,050,579	179,000	22,000	
Static condensers (kilovolt-amperes).....	18,800	12,500		
Synchronous condensers (kilovolt-amperes).....	182,500	70,000		
Substations (number).....	43	2		
Switching stations (number).....	8	3		

VI. FINANCIAL STATUS

The financial position of the administration is indicated by accompanying balance sheet for June 30, 1944. This statement has been prepared from cost records maintained by the administration in accordance with the uniform system of accounts prescribed by the Federal Power Commission for electric utilities operating under the Federal Power Act. The balance sheet reveals an investment of \$842,588 in electric plant before deducting the depreciation of \$3,239,330, leaving a net of \$71,603,258. The plant investment includes only the transmission lines, substations, and related facilities. The amount is included in the plant account for the generating facilities at the Grand Coulee and Bonneville projects inasmuch as these projects are under the jurisdiction of other agencies. Information supplied by the Bureau of Reclamation and the United States Army Engineers regarding the investment in generating projects as of June 30, 1944, is given below. The data exclude interest during construction and are subject to account review.

Item	Bonneville Dam	Grand Coulee Dam	Total
Joint purpose facilities.....	\$38,471,990	\$17,783,405	\$56,255,395
Direct power facilities.....	36,106,635	37,094,620	73,201,255
Direct navigation facilities.....	5,480,895		5,480,895
Direct irrigation facilities.....		5,207,182	5,207,182
Total.....	\$40,069,520	\$18,995,207	\$59,064,727

The tenth and last generating unit at the Bonneville Dam was installed in December 1943. The estimated remaining investment required to complete this project was only \$2,400,000 as of June 30, 1944. At the Grand Coulee project the ultimate investment is estimated at \$487,000,000, of which \$280,800,000 is direct investment for construction works.

Bonneville Power Administration balance sheet, June 30, 1944

Figures in parentheses indicate a deduction.

¹ Received pursuant to contract of sale of certain plant to Public Utility District No. 2 of Pacific County, Wash.

² Created from revenues in accordance with sec. II of the Bonneville Act.

³ Computed at the assumed rate of \$0.00075 per kilowatt-hour pending completion of cost allocations and financial agreements as to cost of power.

⁴ Imputed interest on Federal investment.

⁵ Expended from appropriations for operations.

The balance sheet indicates that revenue receipts have been deposited in the United States Treasury in the amount of \$36,457,168. These receipts are deposited in a special account, except a very small portion representing miscellaneous revenue covered directly into the Treasury, from which a portion has been or will be allocable to the reclamation fund and the remainder has been or will be covered into

the Treasury to the credit of miscellaneous receipts. Upon the completion of accounting analyses and financial negotiations now under way with the Bureau of Reclamation and the Corps of Engineers, War Department, the accounts of the Administration will reflect the application of revenues in much the same way as private industries apply revenue to meet operating expenses, including the cost of power produced at the two Federal dams, interest on the power investment, and repayment of the power investment through an amortization schedule. Inasmuch as these analyses and agreements have not been completed, a consolidated actual financial statement is not available; but the following pro forma statement for the fiscal year 1944 indicates the administration's approximate financial position.

Bonneville Power Administration pro forma statement of consolidated income (partially estimated), fiscal year 1944

Revenues.....		\$20, 893, 363
Operating expenses:		
Bonneville Power Administration....	\$3, 377, 487	
Bonneville Dam project.....	382, 600	
Grand Coulee Dam project.....	993, 329	
Shasta Units: Rental and special costs.....	1, 000, 000	
		\$5, 753, 416
Depreciation:		
Bonneville Power Administration....	1, 119, 429	
Bonneville Dam project.....	439, 100	
Grand Coulee Dam project.....	700, 000	
		2, 258, 529
Total operating revenue deductions.....		8, 011, 945
Net operating revenue.....		12, 881, 418
Income deductions (interest):		
Bonneville Power Administration....	\$1, 846, 057	
Bonneville Dam project.....	1, 100, 000	
Grand Coulee Dam project.....	2, 195, 000	
Total income deductions.....		5, 141, 057
Net income from power operations.....		7, 740, 361

This pro forma statement is based upon information that is now available as to the costs of operating the two generating projects and as to the allocation of the joint investment at these projects to power purposes. In the event the ultimate allocations differ from presently used assumptions, the indicated power cost will be affected. In addition, final figures will reflect adjustments due to the inclusion of interest during construction, and determination of final depreciation and amortization policies. Despite the tentative character of the statements, it is believed that the results are fairly indicative of the answers that may finally be developed.

he statement for fiscal 1944 reflects the actual revenue, operating expenses, depreciation and imputed interest for the Bonneville Power Administration, together with estimates for the expenses, depreciation, interest at the two dams allocable to power. The statement also sets estimates of the costs at the dams for operation, depreciation power facilities including an allocated share of joint items, and imputed interest on the power investment, both direct and joint. The statement thereby indicates the consolidated result of operations, which shows a net income of \$7,740,361 for the fiscal year and is available for amortizing or repaying the investment.

Expenses shown do not include any amounts for the amortization of special war investments in transmission and feeder line facilities although \$1,000,000 is allowed in each of the fiscal years 1944 and 1945 for special costs in connection with the installation of two generating units from the Shasta project as a war measure.

Although revenue for fiscal year 1944 exceeded \$20,000,000, a very substantial proportion of the present revenue is derived from service contracts with war plants and establishments. Of the 1,010,262 kilowatts of total contract demand in active executed contracts, 733,600 kilowatts are in industrial contracts subject to cancellation and an additional 40,850 kilowatts are in very short-term industrial contracts. At the Administration's basic rate of \$17.50 per kilowatt-year these cancellable and short-term industrial contracts involve annual revenue of \$13,552,500. Under industrial contracts having cancellation provisions the total amount of cancellation or termination payments, assuming cancellation of all the contracts effective as of July 1, 1945, would be approximately \$9,200,000, which amount has been set up as representing part the cost of remarketing the power made available by such contract cancellations.

The Bonneville Act and Executive Order 8526 place upon the Administration the responsibility for marketing the power at rates which will make the developments at Bonneville and Grand Coulee financially self-liquidating. The high rate of revenues during the war period, when facilities are operating at extreme overloads and without reserve facilities, has resulted in a surplus that may very well prove to be the medium through which the administration's financial responsibility will be met during the immediate post-war reconversion period when it will be necessary to develop peacetime markets to use the power that has been going into war production. A portion of this surplus should in effect be used now for advance marketing work; the balance will serve as a reserve for post-war adjustments.

VII. ADVANCE TRANSMISSION PROGRAM

Contemplated plans for future transmission line construction based on regional studies made by the Administration are extensive. It is

proposed that the main 230,000-volt transmission grid be extended in the immediate post-war period to tie into the Bonneville-Coulee system new generating plants such as those planned for the Umatilla, Hungry Horse, Cabinet Gorge, and Detroit projects. In addition, new 230,000-volt facilities are proposed for the north Puget Sound area in order to deliver more energy to pulp and paper mills and to meet the demands of expanding industrial growth anticipated in that area.

The over-all transmission capacity of the main system into the Portland area will be increased with new points of delivery. Extensions and reinforcements are planned for the lines into the Willamette Valley. Also planned are extensions into Union County, Oreg., to compensate for power deficiencies in the central Oregon districts.

Contemplated additions to the main transmission grid include lines to Clallam and Jefferson Counties in Washington State to increase the power supply on the Olympic Peninsula now limited by lack of transmission facilities. New lines are planned for Stevens County and the Metaline Falls district of Pend Oreille County to provide for the expansion of the mining industries in the area.

Reinforcement of the various substations and feeder lines of the Bonneville system is planned to help relieve overloaded conditions of facilities and to provide the necessary reserves for normal peacetime service.

These extensions will bring to the outlying districts of the Pacific Northwest a supply of electric power for domestic, agricultural, and industrial uses at the lowest rates available in the nation. To determine the developmental possibilities in these and all other sections of the region, the administration is carrying on a program of county-wide economic surveys. Ten of these have already been completed for counties in the States of Washington and Oregon. A considerable portion of the \$127,000 fund appropriated by Congress for market development activities will be devoted to the expansion and acceleration of these studies in preparation for post-war programs.

Southwestern Power Administration

DOUGLAS G. WRIGHT, Administrator

THE Southwestern Power Administration, an agency of the Department of the Interior, was created by order of the Secretary of the Interior on August 31, 1943, for the purpose of fulfilling the requirements of the Executive Orders 9366 and 9373 which provide for unified administrative control of (a) the operation of the Grand River Dam project and the marketing of the power generated by the project, (b) the marketing of power generated by the Norfolk Dam project, operated by the United States Army Engineers, and (c) the marketing of the power generated by the Denison Dam project, also operated by the United States Army Engineers.

The Southwestern Power Administration assumed these duties on September 1, 1943, with the present Administrator appointed as Acting Administrator.

GRAND RIVER DAM PROJECT

The Grand River Dam project was constructed by the Grand River Dam Authority, an agency of the State of Oklahoma, under a Public Works Administration loan and grant agreement. Construction was started in 1938 and the plant began commercial operation May 1, 1941. Of the total \$25,113,636 estimated cost of the project, \$11,113,636 was supplied by the Federal Government as a grant and \$14,000,000 as a loan which is to be repaid by the Grand River Dam Authority from revenues of the project. The initial installation was four 15,000-kilowatt generating units and space for two additional units.

With the power supply for war production becoming critical in 1941, the President on November 21 assumed control of the project on behalf of the United States under section 16 of the Federal Power Act and

designated the Administrator of the Federal Works Agency to operate the project and dispose of the power generated.

Contracts were negotiated for the sale of power to war industries. Forty thousand kilowatts of the capacity were committed to the Ark-La Electric Cooperative, Inc., for transmission to the Defense Plant Corporation's aluminum plant at Jones Mills, Ark. Other war loads served were Camp Gruber near Muskogee, Okla.; the Oklahoma Ordnance Works near Pryor, Okla.; and the Cardox Corporation at Claremore, Okla.

During the period of Federal control, from November 21, 1941, through June 30, 1944, the gross revenue amounted to \$3,630,692.

NORFORK DAM PROJECT

On June 19, 1943, the President under Executive Order 9353 assigned to the Administrator of the Federal Works Agency the additional responsibility of marketing the power generated at the Norfolk Dam project in Arkansas, which is a combined flood control and hydroelectric development on the North Fork of the White River. This project was constructed and is to be operated by the United States Army Engineer Corps. The project was built with an initial installation of one 35,000-kilowatt generating unit and provision for three additional units. The cost of the Norfolk project is approximately \$26,000,000.

Generation for test purposes started on June 18, 1944. Commercial operation is expected to begin by December 1944. Meanwhile, the plant is being used to generate emergency power that is vitally needed in the southwest area because of unexpectedly heavy war loads and the unexpected failure of some generating equipment on the systems of the privately owned utility companies.

DENISON DAM PROJECT

The Denison Dam project, built by the United States Army Engineer Corps and located between Texas and Oklahoma on the Red River near Denison, Tex., was scheduled for completion in 1944.

The Denison Dam project, like the Norfolk project, is a combined flood control and hydroelectric development. It is also to be operated by the United States Army Engineer Corps. The cost of the Denison project is approximately \$54,000,000. The initial installation consists of one 35,000 kilowatt generating unit and provision for four additional units.

The project commenced test operations in June 1944 and is now being operated on an emergency basis to supply power in the north Texas area. Commercial operation is expected to begin during the first half of 1945.

COORDINATED OPERATION OF THE THREE PROJECTS

With three federally controlled projects within a short distance of each other, it was readily apparent that their operations should be coordinated to assure maximum efficiency. Since the Secretary of the Interior was already well experienced in power-marketing operations through his supervision over the Bonneville Power Administration and the Bureau of Reclamation, the operation of Grand River Dam and the marketing of power from all three projects were placed under his jurisdiction on September 1, 1943.

The Grand River, Denison, and Norfolk Dam projects are all connected to the Southwest power pool transmission network. It is possible, therefore, to coordinate their operations by arranging for the interchange of power and energy between projects during periods of low water or in emergencies as well as for meeting high load commitments. When full commercial operation starts, this flexibility of interchange of energy will permit the Government to make commitments for each project for considerably more load than it could if each project were operated separately. This gain will directly benefit our country's effort.

MARKETING POLICIES

The Grand River Dam project has its own transmission system which enables it to serve its customers directly and without relying on the facilities of others. Interchange agreements with the Public Service Co. of Oklahoma and the Oklahoma Gas & Electric Co. provide on- and off-peak steam-generated power and energy.

Project sales approximate 420 million kilowatt-hours of firm energy per year.

The Denison and Norfolk projects, on the other hand, do not yet have adequate transmission facilities. It was therefore necessary, for the time being, to market the power produced by these projects through the existing transmission facilities of the private utility companies. Under these circumstances it was necessary to negotiate agreements whereby the energy would be sold to the nearest private utility company and these companies in turn were to pass on to war industries, rural electric cooperatives, and other customers the financial benefits derived from the purchase of this low cost energy. A contract has been executed for the output of the Denison plant, providing among other things for a rate reduction in excess of \$400,000 per year. A similar contract is being negotiated with the Arkansas Power and Light Co. for the output of the Norfolk plant.

POST-WAR OPPORTUNITIES

The Grand River Dam project has as customers three municipalities and four Rural Electrification Administration projects. In

addition to these it serves a new plant of the Cardox Corporation at Claremore, and has a contract to serve the new Goodrich Rubber Products plant at Miami, Okla. These are permanent customers which are expected to continue in business after the war. The Denison and Norfolk projects do not as yet have any industrial customers.

The Southwestern Power Administration has an industrial unit which is engaged in the promotion of new customers for the area that will use power after the war. This unit is working with the various chambers of commerce and civic groups throughout the area in the preparation of industrial surveys of the various towns and cities in the regions served by the Grand River, Norfolk, and Denison Dam projects. The Arkansas, Red, and White River Valleys served by these projects offer a promising field for industrialization because of the abundant natural resources and raw materials in their regions.

While the capacity of the three dams is at present largely required for war purposes, there is ample opportunity for post-war operations to absorb the entire output of these three projects as well as a number of new projects which are to be built by the Army after the war. In order to assure proper disposition of this additional power and energy, the Southwestern Power Administration is now studying post-war market possibilities of the area and the transmission facilities needed to serve this probable market.

Bureau of Mines

R. R. SAYERS, Director

FOREWORD

IN CENTERING every effort on the fulfillment of war assignments, the Bureau of Mines in 1944 contributed heavily to the procurement of adequate mineral commodities for victory and the post-war security of the United States.

The great expansion of domestic production, implemented by increased imports during the year, assured ample supplies of virtually all major metals needed for war and essential civilian use. By adding millions of tons to the Nation's known reserves of critical and essential ores and by developing new processes for the utilization of these domestic ores, the Bureau not only furthered the war program but also strengthened national security and improved the prospect of new and better materials for peacetime America.

The war activities of the Bureau augmented its accumulated knowledge of the mineral resources of the United States and Alaska. The urgent demands for metals and minerals prompted the most extensive exploratory program ever attempted. But the urgency of the program at the same time stressed the need for a complete inventory of these resources before another national emergency arises.

Maintaining extreme flexibility in all of its activities, the Bureau swiftly shifted the emphasis of its exploration and research programs to meet each new requirement. As market analyses and military strategy indicated changes in the availability and need for certain metals and minerals last year, the Bureau modified its search for such traditionally strategic minerals as manganese, chromium, mercury, and tungsten, and stressed such minerals as fluorite, beryl, optical calcite, and barite instead.

The exploratory program, conducted in part with the cooperation of the Geological Survey and State agencies, made substantial contributions toward an adequate supply of all these minerals. In addition,

it made known important additional reserves of bauxite, alunite, aluminous clay, mica, and the ores of iron, zinc, lead, copper, molybdenum, and vanadium, together with workable deposits of numerous nonmetallics, including fluorspar, graphite, corundum, kyanite, sillimanite, celestite, and block talc.

Thousands of ore samples were analyzed and many of these were subjected to beneficiation tests to determine whether the minerals could be feasibly extracted. Laboratories and pilot plants developed successful processes for the production of manganese and chromium from domestic low-grade ores and demonstrated methods for the utilization of available low-grade bauxites, alunites, and aluminous clays. Metallurgical investigations and ore-dressing studies conducted on many zinc, lead-zinc, and other ores extended the lives of existing mines and demonstrated the workability of newly developed ore bodies. Milling tests on pegmatites yielded acceptable concentrates and indicated that, with further refinement, milling may supplant wasteful and inefficient hand-sorting of these ores.

A process developed by Bureau chemists and engineers added a new light, strong, and corrosion-resistant metal, titanium, to the practicable list of materials of the future. Industry achieved a considerable reduction in metal losses by adopting techniques evolved from the Bureau's research on the recovery of valuable constituents from aluminum and magnesium drosses, powders, and dust.

With war draining the Nation's petroleum reserves and hastening the day when the United States may have to look elsewhere for motor fuels and lubricants, the Bureau completed preliminary plans for an extensive research program on producing synthetic liquid fuels from coal, oil shale and other materials. Airplanes and automobiles already have been operated successfully on synthetic fuels produced in the Bureau's laboratory-scale pilot plant. Now the task is to build and operate larger demonstration plants to provide technical knowledge and make commercially feasible what may possibly become a great new post-war industry. The preservation of motorized transportation and assurance of adequate national defense for future generations of Americans are the goals.

As coal and all other fuel shortages became acute, war industries relied more heavily upon the Bureau's many services in the field of solid fuels. The Bureau surveyed the entire beehive coke industry and provided technical aid to facilitate production of high-quality metallurgical coke of uniform grade for the steel industry. It explored coal fields of the West to find new sources of coking coals, advised on the substitution of available coals for specialized uses, helped mine operators improve the quality of their product, developed safe methods of storing subbituminous coal during the slack season to ease the manpower shortage, and maintained a consulting service for in-

dustry and Government on fuels and fuel-burning equipment. Millions of tons of coal were sampled and tested for Army, Navy, and other Government purchasing agents, and the volume of boiler water samples analyzed was tripled, saving thousands of dollars and increasing the efficiency of Federally-operated power plants.

With the cooperation of industry, the Bureau opened a Nation-wide fuel efficiency program to combat waste in the industrial and commercial use of all types of fuel and energy.

The Bureau's research on petroleum and natural gas, conducted under stress to meet war objectives, will contribute heavily to the needs of the peace era to come. To supply more oil for war but at the same time prolong the life of the Nation's oil fields, long-range engineering studies were made of producing areas engaged in primary extraction and the latest technical information on secondary recovery was collected and disseminated among operators. Many special reports prepared for the Petroleum Administration for War aided refiners in meeting production schedules on fuel for warplanes, toluene for explosives, and other petroleum products. Particularly significant was the discovery of new sources of base stock and high-octane components for blending into aviation gasoline.

By completing and putting into operation three new helium plants within a single year, making five in all, the Bureau again met the vast helium requirements of the armed forces and, in addition, provided considerable quantities for commercial consumers and the scientific development of new uses for the post-war period.

The Bureau made more than 4,000 chemical analyses and control tests on explosives and inflammable materials, supplementing its own work by placing at the service of the Army, Navy, and other war agencies its research facilities and years of experience in testing blasting materials for the mineral industries. In addition to providing technical information needed in designing munitions and safeguarding manufacturing plants, the Bureau determined inflammability and explosibility factors for organic chemicals used in rapidly expanded textile, synthetic rubber, and plastics industries, and developed new safety standards governing diesel mine locomotives and mine explosives.

With the assistance of the safety, plant-security, and health programs of the Bureau of Mines, the mineral industries in 1944 lowered accident rates in some fields despite war handicaps, and maintained a perfect antisabotage record in all. This is concrete evidence of greater safety achievements to come when the end of the war eliminates the adverse conditions embodied in long hours, inexperienced labor, equipment shortages, and the need for maximum production.

Federal coal mine inspectors visited and revisited hundreds of mines in the United States and Alaska, and attributed the innumer-

able improvements for protecting life and property not only to Federal recommendations but also jointly to company initiative, employee cooperation, and State action. The accident-frequency rate in mines reinspected by the Bureau declined about 6 percent, and coal-mine fatality rates dropped to the lowest point in the industry's history during the first 6 months of 1944.

Safety engineers and instructors trained 25,000 employees of mining and affiliated industries in first aid, and thousands more in mine-rescue and accident-prevention procedures. Bureau men investigated mine fires, explosions, and accidents, and often risked their lives participating in rescue and recovery operations after disasters.

Attributed in a large measure to industry's cooperation in following Federal suggestions, not a single established case of sabotage marred the wartime explosives control and mineral production security programs of the Bureau of Mines. More than 500,000 licenses, including renewals, were issued under the Federal Explosives Act, and special investigators for the Bureau inspected 6,000 stores of explosives last year. Mineral production security engineers inspected or reinspected approximately 2,000 mines, mills, and smelters, and the program was so successful that the staff was curtailed and the emphasis shifted to prevention of production losses from fires and accidents instead of sabotage.

Special research studies were made on air contaminants, and thousands of air samples containing harmful gases and dusts were analyzed for the Army, Navy, and industry. Confidential investigations were made for the Navy on indicating instruments which may protect lives in mines after the war as they do now on ships of the fleet. Inspections were conducted and recommendations prepared on hygienic conditions in mines, plants, and Army posts.

To aid Government and industry in assuring adequate mineral commodities for prosecuting the war and for the anticipated advance in post-war living standards, the Department of the Interior consolidated all of its mineral economic services in the Bureau of Mines. Now providing accurate and up-to-date information on all phases of domestic and foreign mineral production and consumption, these services will be converted swiftly under plans already prepared to help peacetime agencies charged with dealing with vital domestic and world problems such as disposal of Government-held metal and scrap, and unemployment resulting from possible mineral production curtailments, and with such questions as the international control of minerals used in munitions, and equitable distribution of the world's mineral output.

Collecting, analyzing, and publishing current and periodical data on all mineral commodities, the Bureau's commodity specialists undertook many special studies on foreign mineral resources for the War

and Navy Departments as the armies of liberation shattered the ramparts of Axis strongholds and took up the complex relief and rehabilitation problems of freed peoples. With victory on the way, the Bureau received an increasing number of inquiries on reconversion and other post-war problems as Government and industry became more aware of the need for market analyses, including adequate information on mineral uses, supply, and potential demand, to guide public and commercial policy.

Demands from industry, war agencies, and the public for published information continued to increase. Many bulletins, technical papers, handbooks, and Minerals Yearbook chapters were published, but the number of copies printed and distributed was held to a minimum under a rigid policy of economy. Shortage of paper, difficulties of printing, and lack of stenographic help made it necessary to delay publication of many other reports. This postponement resulted in a flood of telephone and personal calls, consuming hundreds of man-hours of the time of the Bureau's engineers, technicians, and commodity experts. It is hoped that these reports, together with a large wartime accumulation of other valuable but still confidential information can be published after victory to service the mineral industries and the general public.

FUTURE WORK

With some of the Nation's richest mineral reserves becoming depleted because of unparalleled military demands, the Bureau of Mines has planned for 1945 another extensive program of exploration and research to develop new domestic sources of these materials as a cushion against the needs of a possibly protracted war and the vast deferred requirements of the post-war world.

Working toward its ultimate goal of a complete inventory of the mineral resources of the United States and Alaska, the Bureau will undertake continent-wide explorations for chromium, manganese, nickel, cobalt, copper, fluorspar, lead, zinc, magnesium, mercury, molybdenum, tungsten, vanadium, and the many pegmatite and non-metallic or industrial minerals. As in the past year, the emphasis given the quest for each mineral will vary with the strategic war needs of the moment.

The Bureau's engineers, metallurgists, chemists, and other technologists will continue to seek and develop the best methods of utilizing known and newly proved domestic mineral reserves, a vital part in the program of stock-piling for both anticipated and unforeseen developments.

One of the more important projects, an investigation of raw material resources for steel production, will be further developed to assure the required steel for an extended war if necessary and to retain for

able improvements for protecting life and property not only to Federal recommendations but also jointly to company initiative, employee cooperation, and State action. The accident-frequency rate in mines reinspected by the Bureau declined about 6 percent, and coal-mine fatality rates dropped to the lowest point in the industry's history during the first 6 months of 1944.

Safety engineers and instructors trained 25,000 employees of mining and affiliated industries in first aid, and thousands more in mine-rescue and accident-prevention procedures. Bureau men investigated mine fires, explosions, and accidents, and often risked their lives participating in rescue and recovery operations after disasters.

Attributed in a large measure to industry's cooperation in following Federal suggestions, not a single established case of sabotage marred the wartime explosives control and mineral production security programs of the Bureau of Mines. More than 500,000 licenses, including renewals, were issued under the Federal Explosives Act, and special investigators for the Bureau inspected 6,000 stores of explosives last year. Mineral production security engineers inspected or reinspected approximately 2,000 mines, mills, and smelters, and the program was so successful that the staff was curtailed and the emphasis shifted to prevention of production losses from fires and accidents instead of sabotage.

Special research studies were made on air contaminants, and thousands of air samples containing harmful gases and dusts were analyzed for the Army, Navy, and industry. Confidential investigations were made for the Navy on indicating instruments which may protect lives in mines after the war as they do now on ships of the fleet. Inspections were conducted and recommendations prepared on hygienic conditions in mines, plants, and Army posts.

To aid Government and industry in assuring adequate mineral commodities for prosecuting the war and for the anticipated advance in post-war living standards, the Department of the Interior consolidated all of its mineral economic services in the Bureau of Mines. Now providing accurate and up-to-date information on all phases of domestic and foreign mineral production and consumption, these services will be converted swiftly under plans already prepared to help peacetime agencies charged with dealing with vital domestic and world problems such as disposal of Government-held metal and scrap, and unemployment resulting from possible mineral production curtailments, and with such questions as the international control of minerals used in munitions, and equitable distribution of the world's mineral output.

Collecting, analyzing, and publishing current and periodical data on all mineral commodities, the Bureau's commodity specialists undertook many special studies on foreign mineral resources for the War

and Navy Departments as the armies of liberation shattered the ramparts of Axis strongholds and took up the complex relief and rehabilitation problems of freed peoples. With victory on the way, the Bureau received an increasing number of inquiries on reconversion and other post-war problems as Government and industry became more aware of the need for market analyses, including adequate information on mineral uses, supply, and potential demand, to guide public and commercial policy.

Demands from industry, war agencies, and the public for published information continued to increase. Many bulletins, technical papers, handbooks, and Minerals Yearbook chapters were published, but the number of copies printed and distributed was held to a minimum under a rigid policy of economy. Shortage of paper, difficulties of printing, and lack of stenographic help made it necessary to delay publication of many other reports. This postponement resulted in a flood of telephone and personal calls, consuming hundreds of man-hours of the time of the Bureau's engineers, technicians, and commodity experts. It is hoped that these reports, together with a large wartime accumulation of other valuable but still confidential information can be published after victory to service the mineral industries and the general public.

FUTURE WORK

With some of the Nation's richest mineral reserves becoming depleted because of unparalleled military demands, the Bureau of Mines has planned for 1945 another extensive program of exploration and research to develop new domestic sources of these materials as a cushion against the needs of a possibly protracted war and the vast deferred requirements of the post-war world.

Working toward its ultimate goal of a complete inventory of the mineral resources of the United States and Alaska, the Bureau will undertake continent-wide explorations for chromium, manganese, nickel, cobalt, copper, fluor spar, lead, zinc, magnesium, mercury, molybdenum, tungsten, vanadium, and the many pegmatite and non-metallic or industrial minerals. As in the past year, the emphasis given the quest for each mineral will vary with the strategic war needs of the moment.

The Bureau's engineers, metallurgists, chemists, and other technologists will continue to seek and develop the best methods of utilizing known and newly proved domestic mineral reserves, a vital part in the program of stock-piling for both anticipated and unforeseen developments.

One of the more important projects, an investigation of raw material resources for steel production, will be further developed to assure the required steel for an extended war if necessary and to retain for

able improvements for protecting life and property not only to Federal recommendations but also jointly to company initiative, employee cooperation, and State action. The accident-frequency rate in mines reinspected by the Bureau declined about 6 percent, and coal-mine fatality rates dropped to the lowest point in the industry's history during the first 6 months of 1944.

Safety engineers and instructors trained 25,000 employees of mining and affiliated industries in first aid, and thousands more in mine-rescue and accident-prevention procedures. Bureau men investigated mine fires, explosions, and accidents, and often risked their lives participating in rescue and recovery operations after disasters.

FUTURE WORK

With some of the Nation's richest mineral reserves becoming depleted because of unparalleled military demands, the Bureau of Mines has planned for 1945 another extensive program of exploration and research to develop new domestic sources of these materials as a cushion against the needs of a possibly protracted war and the vast deferred requirements of the post-war world.

Working toward its ultimate goal of a complete inventory of the mineral resources of the United States and Alaska, the Bureau will undertake continent-wide explorations for chromium, manganese, nickel, cobalt, copper, fluorspar, lead, zinc, magnesium, mercury, molybdenum, tungsten, vanadium, and the many pegmatite and non-metallic or industrial minerals. As in the past year, the emphasis given the quest for each mineral will vary with the strategic war needs of the moment.

The Bureau's engineers, metallurgists, chemists, and other technologists will continue to seek and develop the best methods of utilizing known and newly proved domestic mineral reserves, a vital part in the program of stock-piling for both anticipated and unforeseen developments.

One of the more important projects, an investigation of raw material resources for steel production, will be further developed to assure the required steel for an extended war if necessary and to retain for

able improvements for protecting life and property not only to Federal recommendations but also jointly to company initiative, employee cooperation, and State action. The accident-frequency rate in mines reinspected by the Bureau declined about 6 percent, and coal-mine fatality rates dropped to the lowest point in the industry's history during the first 6 months of 1944.

Safety engineers and instructors trained 25,000 employees of mining and affiliated industries in first aid, and thousands more in mine-rescue and accident-prevention procedures. Bureau men investigated mine fires, explosions, and accidents, and often risked their lives participating in rescue and recovery operations after disasters.

Attributed in a large measure to industry's cooperation in following Federal suggestions, not a single established case of sabotage marred the wartime explosives control and mineral production security programs of the Bureau of Mines. More than 500,000 licenses, including renewals, were issued under the Federal Explosives Act, and special investigators for the Bureau inspected 6,000 stores of explosives last year. Mineral production security engineers inspected or reinspected approximately 2,000 mines, mills, and smelters, and the program was so successful that the staff was curtailed and the emphasis shifted to prevention of production losses from fires and accidents instead of sabotage.

Special research studies were made on air contaminants, and thousands of air samples containing harmful gases and dusts were analyzed for the Army, Navy, and industry. Confidential investigations were made for the Navy on indicating instruments which may protect lives in mines after the war as they do now on ships of the fleet. Inspections were conducted and recommendations prepared on hygienic conditions in mines, plants, and Army posts.

To aid Government and industry in assuring adequate mineral commodities for prosecuting the war and for the anticipated advance in post-war living standards, the Department of the Interior consolidated all of its mineral economic services in the Bureau of Mines. Now providing accurate and up-to-date information on all phases of domestic and foreign mineral production and consumption, these services will be converted swiftly under plans already prepared to help peacetime agencies charged with dealing with vital domestic and world problems such as disposal of Government-held metal and scrap, and unemployment resulting from possible mineral production curtailments, and with such questions as the international control of minerals used in munitions, and equitable distribution of the world's mineral output.

Collecting, analyzing, and publishing current and periodical data on all mineral commodities, the Bureau's commodity specialists undertook many special studies on foreign mineral resources for the War

and Navy Departments as the armies of liberation shattered the ramparts of Axis strongholds and took up the complex relief and rehabilitation problems of freed peoples. With victory on the way, the Bureau received an increasing number of inquiries on reconversion and other post-war problems as Government and industry became more aware of the need for market analyses, including adequate information on mineral uses, supply, and potential demand, to guide public and commercial policy.

Demands from industry, war agencies, and the public for published information continued to increase. Many bulletins, technical papers, handbooks, and Minerals Yearbook chapters were published, but the number of copies printed and distributed was held to a minimum under a rigid policy of economy. Shortage of paper, difficulties of printing, and lack of stenographic help made it necessary to delay publication of many other reports. This postponement resulted in a flood of telephone and personal calls, consuming hundreds of man-hours of the time of the Bureau's engineers, technicians, and commodity experts. It is hoped that these reports, together with a large wartime accumulation of other valuable but still confidential information can be published after victory to service the mineral industries and the general public.

FUTURE WORK

With some of the Nation's richest mineral reserves becoming depleted because of unparalleled military demands, the Bureau of Mines has planned for 1945 another extensive program of exploration and research to develop new domestic sources of these materials as a cushion against the needs of a possibly protracted war and the vast deferred requirements of the post-war world.

FUTURE WORK

With some of the Nation's richest mineral reserves becoming depleted because of unparalleled military demands, the Bureau of Mines has planned for 1945 another extensive program of exploration and research to develop new domestic sources of these materials as a cushion against the needs of a possibly protracted war and the vast deferred requirements of the post-war world.

Working toward its ultimate goal of a complete inventory of the mineral resources of the United States and Alaska, the Bureau will undertake continent-wide explorations for chromium, manganese, nickel, cobalt, copper, fluorspar, lead, zinc, magnesium, mercury, molybdenum, tungsten, vanadium, and the many pegmatite and non-metallic or industrial minerals. As in the past year, the emphasis given the quest for each mineral will vary with the strategic war needs of the moment.

The Bureau's engineers, metallurgists, chemists, and other technologists will continue to seek and develop the best methods of utilizing known and newly proved domestic mineral reserves, a vital part in the program of stock-piling for both anticipated and unforeseen developments.

One of the more important projects, an investigation of raw material resources for steel production, will be further developed to assure the required steel for an extended war if necessary and to retain for

the post-war United States the ability to compete in world mineral production. Aimed at effective utilization of widespread deposits of steel-making materials, including the ferroalloys and fluorspar as well as iron ore, the program calls for compilation of a detailed record of these resources and the construction of three pilot and demonstration plants in the areas in which the raw materials exist.

A 5-year program of research and demonstration-plant construction will be pursued under the Synthetic Liquid Fuels Act in cooperation with the oil and coal industries. The program envisages the construction of an oil-shale demonstration plant and demonstration plants for synthesis of liquid fuels from coal and lignite to provide the information on design and operation needed for ultimate private commercial developments. Meanwhile, research will continue in the Bureau's laboratory-scale hydrogenation plant, and a pilot plant under construction at Grand Forks, N. Dak., will be completed for gasification of subbituminous coal and lignite to provide water gas for reduction of iron ore and synthesis of oil or gasoline from coal. The Bureau's newly installed electron microscope will be used to study the constitution of coal in relation to the problems of carbonization and hydrogenation.

To assist the anthracite industry, new research programs are underway on the prevention of floods, and increased production by mechanical mining.

To increase pig-iron production, new and more extensive investigations will be conducted with a view of improving the quality of coking coal and metallurgical coke. Exploration of western and southwestern coal fields for new sources of coking coals will continue, together with research on problems of making and using sponge iron, producing steam from solid fuels, effects of slag on furnace performance, use of substitute fuels, fuel-burning equipment, explosives, and mine operations. The scope of tests on the explosibility of industrial dusts will be widened to include factors not amenable to laboratory treatment, and the Nation-wide campaign promoting efficient commercial and industrial use of fuel and energy will continue.

With the expansion of helium-production facilities virtually completed, activities have turned to economies in production, conservation of helium, better transportation methods, and wider commercial uses. Pipeline facilities needed to return surplus helium to underground storage will be completed in October 1944, saving for future military, medical, scientific, and commercial uses millions of cubic feet that otherwise would be lost forever in fuel gas going to market. Investigations will be undertaken for improving metals by using helium in their manufacture and for bettering the process in which helium is used as an inert atmosphere around the torch in welding magnesium, aluminum, and alloy steels. A pilot plant is being constructed for

liquefying helium in large quantities for use in investigating metallurgical processes and properties of metals, and efforts will be made to design a container for transporting helium in liquid form, which would save vast quantities of steel required for cylinders and tank cars, reduce freight charges, and lighten the burden on transportation facilities.

Congress having appropriated funds for the employment of 25 additional coal-mine inspectors, the Bureau will increase its total field staff to 132 inspectors and 10 specialist engineers and inspect a greater number of mines. This should result in more improvements in safety practices and further curtailments in coal-mine accident rates over a period of years.

SUMMARY OF ACTIVITIES

TECHNOLOGICAL WORK

Exploration and Metallurgical Research

As the flood of the United Nations' war production approached the crest and required more and more raw materials, mineral exploratory crews of the Bureau of Mines ranged into new and untouched areas of the United States and Alaska and its scientists delved deeper into the mysteries of metallurgy to meet each new challenge for metals and mineral products.

Changing fortunes of war altered the relative need for various metals, and the Bureau swiftly shifted the emphasis of its exploratory and research work from such traditionally strategic minerals as manganese, chromium, mercury, and tungsten, to fluorite, beryl, optical calcite, and barite. The exploratory work made substantial contributions toward a growing security in each of these materials, and the Bureau had a leading part in developing a new alloy of copper, electrolytic manganese and nickel, which may make a future supply of beryl for motor parts and other uses less critical.

The search for additional bauxite and the demonstration of methods for utilizing domestic low-grade bauxites, aluminous clays, and alunites were continued with outstanding success. The quest for more raw materials for the steel industry, including alloying elements, established important new sources of iron, tungsten, nickel, and chromium ores. Bureau laboratories concentrated on effective utilization of these ores and those from low-grade manganese and chrome deposits found by exploratory crews. Some of the processes developed doubtless cannot be employed during the present war, but they will be available in any future emergency.

A large volume of work remains to be done, and additional pilot plants are planned for 1945 to demonstrate how to utilize minerals

of definite areas in war and peace. Mining and metallurgical research will be conducted in the eight experiment stations and the program will be administered through regional and district offices to maintain close and effective cooperation with the mining industry and with State and other local agencies (as of June 30, 1944, there were 3 regional offices and 25 district offices). A new electrodevelopment laboratory, authorized by Congress 2 years ago, has been opened at Albany, Oreg., to study mineral treatment problems of the Northwest, where low-cost power will be a factor in post-war developments.

Advancements of the Bureau toward the projected goal of a complete inventory of national mineral resources and effective methods of processing these minerals are reflected in the progress reports for various commodities.

Iron, steel, and ferroalloys.—Substantial tonnages of ore were indicated in many areas as the Bureau of Mines, helping the iron and steel industry maintain its war production schedules by providing adequate raw materials, explored 70 deposits in 30 States and Alaska during the year. Some of the 70 deposits, which included 35 iron, 4 chromium, 6 manganese, 3 molybdenum, 3 nickel, 4 vanadium, 7 tungsten, and 8 fluorspar deposits, are now supplying the metal for landing boats, heavy guns, tanks, and other weapons being used to drive the Jap from his island outposts and the Nazi from occupied areas of Europe.

Continuing its exploration for additional iron ore for a greatly-expanded steel industry, the Bureau has found large tonnages of usable ore in Utah, Nevada, California, and Montana to feed the new blast furnaces of the West. At the Scotia mine in Pennsylvania, the Bureau indicated more than a million tons of washed ore reserves (brown ore) with a marketable grade between 48 and 51 percent iron, and the property should be in production soon, for commercial interests were erecting a sink-float plant to beneficiate the ore. At the Poorman iron deposit on Kasaan Peninsula, Prince of Wales Island, Alaska, an exploration project indicated approximately a million long tons of measured ore, with an average content of 52.4 percent iron. In Georgia, similar work resulted in the mining and shipment of considerable tonnages of brown iron ore to the furnaces at Birmingham, Ala.

Intensive study has shown that most of the iron ores from deposits explored by the Bureau can be concentrated to metallurgical-grade, and that very high purity concentrates particularly suited to one type of sponge iron manufacture can be produced from a deposit in North Carolina and another in New Mexico. Adoption of a non-choking classifier developed by the Bureau made possible additional recoveries with higher-grade products at plants treating Alabama red iron ores.

Sponge iron research and pilot plant work progressed at several points. At Laramie, Wyo., production was begun at the large sponge iron rotary kiln demonstration plant, using local coal and iron ore as the raw materials, but additional investigations will be necessary before the commercial possibilities are known. At Longview, Tex., experiments were completed at a semicommercial plant using natural gas and Texas iron ore, and commercial interests were considering recommendations for changes to bring the plant into production. A dual process was developed for making sponge iron from low-grade, refractory, Minnesota iron ores, using gas obtained from North Dakota lignite, and plans were completed for combining these steps in a demonstration plant. About 250 tons of sponge iron, produced in Bureau-operated brick plants in Ohio and North Carolina, was being used in commercial plants to determine its value for the production of steel and wrought iron.

To lessen the dependence of the steel industry upon imports of ferroalloys, the Bureau of Mines last year conducted exploration work for all of these minerals—chrome, manganese, cobalt, nickel, tungsten, vanadium, and molybdenum.

A large tonnage of low-grade manganese ore was delineated in Pennsylvania, and Bureau exploration projects for mangiferous iron ore were successful in Georgia where two of the properties drilled were in production. Mining, ore-dressing, and other problems involved in using the extensive but low-grade manganese ores at Chamberlain, South Dakota, still were under study.

As the shipping shortage eased, permitting importation of higher-grade ores, all of the major manganese production projects recommended by the Bureau were abandoned except one—the milling project at Butte, Montana. The Las Vegas hydrometallurgical project, which had not been recommended by the Bureau, failed to produce substantial quantities of manganese and proved the need for extensive pilot-plant testing of processes before large-scale use. Such tests were completed on two processes developed in the Bureau laboratories, the nitrogen dioxide and the dithionate methods, and these now are available for quantity production of manganese from domestic low-grade ores in any future emergency.

The foundation for effective peace-time use of domestic manganese deposits was laid firmly at Boulder City, Nev., where the Bureau's electrolytic manganese pilot plant was operated with greater efficiency. The product was used in magnesium bomb cases and in a variety of steels and nonferrous alloys tested for commercial value.

The Bureau continued exploration work on the iron-nickel-chromium ores of Washington and completed small-scale pilot plant tests demonstrating the feasibility of smelting these ores.

of definite areas in war and peace. Mining and metallurgical research will be conducted in the eight experiment stations and the program will be administered through regional and district offices to maintain close and effective cooperation with the mining industry and with State and other local agencies (as of June 30, 1944, there were 3 regional offices and 25 district offices). To lessen the dependence of the steel industry upon imports of ferroalloys, the Bureau of Mines last year conducted exploration work for all of these minerals—chrome, manganese, cobalt, nickel, tungsten, vanadium, and molybdenum.

A large tonnage of low-grade manganese ore was delineated in Pennsylvania, and Bureau exploration projects for manganimiferous iron ore were successful in Georgia where two of the properties drilled were in production. Mining, ore-dressing, and other problems involved in using the extensive but low-grade manganese ores at Chamberlain, South Dakota, still were under study.

As the shipping shortage eased, permitting importation of higher-grade ores, all of the major manganese production projects recommended by the Bureau were abandoned except one—the milling project at Butte, Montana. The Las Vegas hydrometallurgical project, which had not been recommended by the Bureau, failed to produce substantial quantities of manganese and proved the need for extensive pilot-plant testing of processes before large-scale use. Such tests were completed on two processes developed in the Bureau laboratories, the nitrogen dioxide and the dithionate methods, and these now are available for quantity production of manganese from domestic low-grade ores in any future emergency.

The foundation for effective peace-time use of domestic manganese deposits was laid firmly at Boulder City, Nev., where the Bureau's electrolytic manganese pilot plant was operated with greater efficiency. The product was used in magnesium bomb cases and in a variety of steels and nonferrous alloys tested for commercial value.

The Bureau continued exploration work on the iron-nickel-chromium ores of Washington and completed small-scale pilot plant tests demonstrating the feasibility of smelting these ores.

An entirely new tungsten area was opened, making the East a potential producer for the first time, when a large tungsten ore deposit was explored by the Bureau in North Carolina.

Deposits of molybdenum also were explored in North Carolina, Montana, and Arizona. The most outstanding find was in Halifax County, North Carolina, where about 500,000 tons of inferred low-grade ore with an average content of 0.55 percent molybdenum was indicated. A substantial tonnage of submarginal molybdenum material was found in Montana.

Completing approximately 39,000 feet of diamond drilling on 40 vanadium properties in the Colorado-Utah area, the Bureau indicated approximately 40,000 tons of minable ore and a considerable part of this ore already has been mined. Exploration of vanadiferous deposits in Wyoming revealed approximately 1,481,000 tons of inferred low-grade ore with an average grade of about 0.746 vanadium, and methods for treating this material have been developed in Bureau laboratories.

Important new fluorspar industries with a promise of peace-time permanency sprang up in Utah and Texas as a result of Bureau work, and approximately 41,500 tons of fluorspar with an average grade of 30 percent, which can be concentrated, were indicated in the Kentucky-Illinois fields. Metallurgical tests conducted in conjunction with exploratory work on fluorite deposits in Utah, have shown the ore to be amenable to concentration for production of metallurgical and acid-grade fluorspar, and the Bureau has developed a method by which the finely-divided flotation concentrate can be agglomerated to meet the size requirements of the metallurgical industry. A mill was constructed and this property went into production. The Bureau's exploratory work in Texas opened a new fluorspar mining district in the Eagle Mountains of Hudspeth County which is one of the more significant recent developments in that State.

Nonferrous minerals.—Concurrent with an expanded program of exploration and research on zinc and lead ores, the Bureau of Mines launched a major drainage project to revive the dormant Leadville district in Lake County, Colorado, where 84 flooded mines have been idle since 1933. A tunnel now under construction for the permanent gravity drainage of these properties will make available an estimated 4 million tons of readily-mined zinc, lead, and manganese ores for the security and commercial needs of post-war America.

Exploration of 30 deposits in 15 States last year added 12 million tons of new zinc and lead-zinc ores to the country's reserves. In the same period, 730 zinc and lead deposits were examined by Bureau engineers, and ore-dressing tests and other metallurgical investigations in the Bureau's laboratories determined efficient methods of utilizing many ores. These combined activities extended the lives of producing

mines and demonstrated the workability of newly developed ore bodies.

Conducting 17 exploration projects for copper in 10 States, the Bureau marked out 773,000 tons of commercial ore containing 2.0 percent copper and 406,000 tons of marginal ore containing 1.3 percent copper. The work involved diamond and churn drilling, trenching, test-pitting, rehabilitating old mine workings, sampling, and drilling long holes with percussion air drills.

Carrying their quest for tin to remote Seward Peninsula, where only the storm-whipped Bering Strait separates Alaska from the Soviet Union, Bureau engineers explored six deposits before snow and bitter cold compelled suspension of the work until another summer. Three additional deposits were explored, two in Montana and one in California. A recoverable reserve of 3,450 tons of tin was indicated in three of the nine deposits.

Ore containing the equivalent of 6,100 flasks of mercury was delimited by a Bureau exploratory crew at a mine in Alaska, and drilling in Napa County, Calif., indicated submarginal mercury ore in sufficient tonnage to warrant continuing the work in the 1945 fiscal year. No ore was found in 3 other explorations.

Trenching, tunneling, and diamond drilling were carried out on 19 pegmatite deposits in 9 widely scattered States, and extensive experiments were conducted on ore-dressing methods for extracting the minerals from their ores. At 9 deposits, Bureau personnel established workable reserves of strategic mica for radio parts and aviation spark plugs; at 8, significant quantities of beryl for alloys used in springs, motor parts subject to wear, and parachute harness fasteners; at 2, commercial quantities of lithium for high-conductivity copper castings, ceramics, and pharmaceuticals; and in 2 others, exploitable reserves of rare tantalum minerals for radio vacuum tubes and surgical and dental supplies.

Recent pioneering tests in the Bureau's laboratories and pilot plants on the milling of pegmatites to segregate the desired minerals have yielded acceptable concentrates, indicating that with further refinement milling may supplant the present wasteful and inefficient hand-sorting of these ores.

Nonmetallic minerals.—Now essential in a multiplicity of war products, the nonmetallic or industrial minerals will acquire added importance in the approaching post-war period when there will be an immense demand for building materials, insulating products, fertilizer minerals, paints, pigments, and inorganic compounds. With the double objective of satisfying the needs of war and peace, the Bureau of Mines charted workable deposits of graphite, corundum, optical calcite, kyanite, sillimanite, celestite, block talc, and barite. Means for beneficiating and using these domestic resources were developed

An entirely new tungsten area was opened, making the East a potential producer for the first time, when a large tungsten ore deposit was explored by the Bureau in North Carolina.

Deposits of molybdenum also were explored in North Carolina, Montana, and Arizona. The most outstanding find was in Halifax County, North Carolina, where about 500,000 tons of inferred low-grade ore with an average content of 0.55 percent molybdenum was indicated. A substantial tonnage of submarginal molybdenum material was found in Montana.

Completing approximately 39,000 feet of diamond drilling on 40 vanadium properties in the Colorado-Utah area, the Bureau indicated approximately 40,000 tons of minable ore and a considerable part of this ore already has been mined. Exploration of vanadiferous deposits in Wyoming revealed approximately 1,481,000 tons of inferred low-grade ore with an average grade of about 0.746 vanadium, and methods for treating this material have been developed in Bureau laboratories.

Important new fluorspar industries with a promise of peace-time permanency sprang up in Utah and Texas as a result of Bureau work, and approximately 41,500 tons of fluorspar with an average grade of 30 percent, which can be concentrated, were indicated in the Kentucky-Illinois fields. Metallurgical tests conducted in conjunction with exploratory work on fluorite deposits in Utah, have shown the ore to be amenable to concentration for production of metallurgical and acid-grade fluorspar, and the Bureau has developed a method by which the finely-divided flotation concentrate can be agglomerated to meet the size requirements of the metallurgical industry. A mill was constructed and this property went into production. The Bureau's exploratory work in Texas opened a new fluorspar mining district in the Eagle Mountains of Hudspeth County which is one of the more significant recent developments in that State.

Nonmetallic minerals.—Now essential in a multiplicity of war products, the nonmetallic or industrial minerals will acquire added importance in the approaching post-war period when there will be an immense demand for building materials, insulating products, fertilizer minerals, paints, pigments, and inorganic compounds. With the double objective of satisfying the needs of war and peace, the Bureau of Mines charted workable deposits of graphite, corundum, optical calcite, kyanite, sillimanite, celestite, block talc, and barite. Means for beneficiating and using these domestic resources were developed

through intensive laboratory research and partial independence of foreign sources was established.

Achievements of the year were numerous. Light-weight, high-temperature refractories of the "Navy" brick type were made from topaz and domestic kyanite but will require some minor perfections. Special insulators for military and other radio equipment were prepared from domestic talcs, replacing former imports, and promising deposits of block talc were found in California and Montana. Exploration for domestic graphites was concluded and methods were developed for recovering a maximum of large flake needed as a lubricant, for foundry facing, in the manufacture of crucibles, stoppers for steel ladles, and other war uses. Eliminating a long rail haul, commercial development began on foundry molding sands explored in Oregon, and a tremendous reserve of commercial-grade sillimanite discovered in South Carolina will be exploited more thoroughly at once. Preliminary tests on bauxitic clays associated with the Alabama and Georgia bauxites indicated that many were suitable for high-temperature refractories, and they will be investigated in greater detail. Domestic clays were classified and a publication was issued enabling the average person interested in the development of clay products to determine for what purpose a specific type is best adapted.

Light metals.—Anticipating the accelerated tempo of the victory drive and the demands for aluminum, magnesium, and their alloys, the Bureau of Mines called on its exploratory, laboratory, and pilot plant crews to promote a still greater output of these light metals from domestic sources.

Responding to the challenge, exploratory crews quadrupled their 1943 discoveries by increasing known reserves of bauxite more than 40 million tons, of which about 15 million tons were of a grade suitable for direct use in present Bayer alumina plants. Since much of the bauxite was found at depths supposed to preclude economical exploitation, the Bureau undertook studies to develop new methods of mining the material. In Arkansas, construction began on a pilot mill to demonstrate the commercial feasibility of a Bureau process for beneficiating low-grade bauxite to yield a feed for Bayer-plant processing.

Other exploratory drilling increased the reserves of alunite, another alumina-bearing material, to more than 32 million tons, and the Nation's aluminous clay deposits were proven to exceed 1 billion tons.

A large factor in securing War Production Board authorization for the construction of several 50-ton-a-day semicommercial alumina plants, the Bureau's pilot-plant work on chemical processes was continued to permit use of alunite, clays, and other aluminiferous ores. Commercial sponsors of the alumina plants called upon Bureau engineers for aid in designing, installing, and ultimately putting the plants into operation.

At the Bureau's Norris, Tenn., laboratory, engineers and chemists developed a process for producing magnesia, nickel, chromite, and silica gel from North Carolina and Washington olivines, a magnesium-silicate material which constitutes the Nation's second largest reserve of magnesium and one which previously had defied attempts at utilization. The process will be carried to the pilot-plant stage to obtain information on cost, design, and operation.

A process for the production of magnesium oxide and magnesium chloride from dolomite was developed with the cooperation of a private concern and was submitted to pilot-plant tests. During this investigation, a method was found for rotary kiln decomposition of magnesium chloride hexahydrate, an operation that had been considered commercially impracticable. Large-scale pilot work on the production of magnesium metal directly from the oxide by electrolytic means was continued, together with research on the carbothermic reduction process.

Industry achieved a considerable reduction in metal losses by adopting techniques evolved from Bureau studies on the recovery of valuable constituents from aluminum and magnesium drosses, powders, and dust.

Titanium, a light, strong, and corrosion-resistant metal, was added to the list of useful materials of the future by a process developed by chemists and engineers of the Bureau laboratories at Salt Lake City, Utah. The process work, involving powder metallurgy, is being carried forward at Boulder City, Nev., and at Salt Lake City in preparation for pilot-plant experiments.

Coal and Coal Products

Greater production of coal and coke, better quality fuel, and conservation of fuel resources through more efficient utilization—these were the focal points for the multifold solid-fuel activities conducted by the Bureau of Mines during 1944 to meet the staggering demands of war and to maintain the position of the United States as the No. 1 industrial power when peace returns.

Coal analysis.—More than 20,000 samples of coal, coal dust, coke, peat, pitch, and tar were analyzed during the year. The tests helped guide Government purchasing agents in awarding contracts for millions of tons of coal, aided Federal coal-mine inspectors in formulating recommendations to curb coal-dust explosion hazards in mines, assisted Bureau engineers and scientists in coal-field exploration and research, and helped operators improve the quality of their products. Savings by the War Department alone in rejecting inferior fuels were greater than the actual cost of the service. At that Department's request, the Bureau sampled coal and trained Army personnel in coal sampling at military posts throughout the country. The volume of

tests made on boiler feed water was tripled to prolong the life and increase the efficiency of Army boiler plants. A consulting service was maintained for industry and Federal agencies on substitute fuels, types and changes in fuel-burning equipment, and means for increasing efficiency of power plants.

Coal mining and exploration.—Coal fields of the West were explored to find new sources of coking coal for steel plants in that area and to locate minable beds to relieve the critical fuel shortage in the Pacific Northwest and provide an adequate supply for post-war development. Studies were made on new methods for distributing rock dust and the use of air conditioning to curb roof falls. Many operators were assisted in improving mining practices.

Gas- and dust-explosion research.—Mechanization of coal mines and increased production for war posed problems which made necessary the testing of larger-than-standard charges of permissible explosives to determine their gas-and-dust ignition hazards. Other services to industry with a post-war value included determinations of the inflammability of powdered metals and plastics. Military pyrotechnics also were tested.

Coal preparation and storage.—To supplement limited supplies of high rank coals needed in certain industries, the Bureau investigated conversion of marginal coal by preparatory treatment and the salvaging of coal now rejected merely because it is mixed with impurities. Helping to alleviate conditions resulting from the critical manpower shortage, the Bureau developed methods for storing during the slack mining season unlimited quantities of subbituminous coal in open pits and in homes without loss from oxidation or spontaneous combustion. Safe storage now is possible on the West coast, at isolated Army posts, and at other places remote from the sources of supply.

Coal combustion.—The Bureau developed a small, new-type stoker which will burn subbituminous coal for 30 days without attention and supply hot water for a normal-size family at a cost of less than a dollar a month. Offering a post-war promise of modern heating service at minimum expense to Western rural families, the Bureau plans to develop larger models for household heating. Meanwhile, research continued on the effect of coal-ash on the operation of large boiler furnaces generating power for essential industries, and means were developed for preventing serious loss of steam capacity from external corrosion of furnace wall-tubes. Successful methods were found for using small sizes of anthracite as domestic fuel, which may help ease shortages in the larger sizes.

Fuel efficiency.—To offset or at least alleviate a possible fuel shortage in the winter of 1944-45, a National fuel efficiency program was launched during the year with the cooperation of industry to combat wasteful practices in the commercial and industrial use of all types of

fuel and energy. A council of 12 leading fuel engineers was established, and 110 coordinators were appointed to administer the program in assigned areas with the assistance of 5,000 "regional engineers," all volunteers from industry.

Coke studies.—Answering a plea from the Nation's steel industry for more and better-grade metallurgical coke, the Bureau of Mines sent engineers and a mobile laboratory into the field, conducted a critical survey of the needs of the entire beehive coke industry, and provided operators with the technical information needed to produce the blast furnace fuel required for maximum steel production. A study was made of methods employed by certain coal companies in producing coal of uniform ash and sulfur content by careful blending of coal and control of the mining operation, and tests were conducted on the carbonizing, expanding, and storing properties of coals from newly developed fields to maintain supplies of suitable coking coals.

Synthetic liquid fuels.—Noting the unparalleled war withdrawals from the petroleum reserves of the United States and the continuing decline in the discoveries of new oil fields, the Seventy-eighth Congress appropriated \$5,000,000 and authorized the Bureau of Mines to construct and operate demonstration-size plants to produce synthetic liquid fuels from coal, oil shales, agricultural, and forestry products. Guided by experiments conducted for several years in a laboratory-scale pilot plant and other installations, the Bureau has prepared comprehensive research programs on coal hydrogenation, synthesis of liquid fuels from hydrogen and carbon monoxide, and shale-oil extraction, and is designing the new equipment and buildings needed. The project will help provide the "know how" for ultimate private commercial production and a lasting supply of fuel for the machines of a post-war motorized America.

A pilot plant for complete gasification of subbituminous coal and lignite was designed, built, and tested successfully during 1944. Another pilot plant is under construction at Grand Forks, N. Dak., which will provide 400,000 cubic feet of hydrogen-rich water gas daily for the reduction of iron ore and could be employed for synthesis of oil or gasoline from coal. Tests have shown that subbituminous coal will yield the same amount of water gas as high-rank coals, although its cost at the mine is less than half. Meanwhile additional progress was counted in certain phases of laboratory experiments on coal hydrogenation and synthesis of liquid fuels, and a method was developed for predicting the yields of primary tar and light oil from analyses of the coal.

Petroleum and Natural Gas

Many important war assignments on petroleum and natural gas have been carried out, and the Bureau of Mines has contributed to post-war needs with each achievement because research in this field must be conducted along the same general lines, whether the results be applied in war or peace.

Despite handicaps, war missions were fulfilled on four major fronts: primary extraction of oil, secondary recovery, chemistry and refining, and helium production.

Manpower shortages were encountered, together with difficulties in obtaining equipment needed to test flowing wells, but the Bureau's small staff of petroleum engineers supplied basic knowledge and applied technical skill to the operation of condensate and other types of fields engaged in primary extraction of oil. Five engineering reports on Gulf coast fields and three others on the flow characteristics and properties of the fluids in separate reservoirs were supplied to the Petroleum Administration for War and the operators in response to a need for specific facts and figures, and aided the entire war program. Subsurface surveys were made in two important Rocky Mountain fields to permit the formation of plans to operate them at high rates of production, and research was continued on the effect of well spacing on oil recovery.

To supply more oil for war by secondary recovery—stimulative methods of production in fields where nature no longer drives oil to the wells—Bureau engineers disseminated information of modern engineering practices among the 15,000 oil operators of the Appalachian region; surveyed water-flooding projects in Oklahoma, Kansas, and Illinois; studied air- and gas-injection in Illinois; and collected data, on water flooding of limestone reservoirs, a subject on which little information has been available. Laboratory research continued on mechanical and solvent extraction of oil from impregnated surface and near-surface deposits, and experiments were made on reducing the cost of lifting oil from vertical wells by introducing the use of siphons on properties where air and gas are injected. A report was begun on observations of a project in Venango County, Pa., where horizontal holes are being drilled into the oil sand from a vertical shaft. Many of the Bureau's findings on secondary recovery will prolong the period in which the United States can depend upon natural crude-oil deposits as its main source of petroleum for liquid fuels and chemical products.

Hitherto unknown sources of base stock and high-octane components for blending into aviation gasoline were disclosed by the Bureau's chemical and refining research. This information aided the Petroleum Administration for War and the refiners materially in meeting the needs of war for aviation fuel, toluene used in the manufacture of explosives, and other petroleum products.

More than 40 reports were submitted during the year to the Petroleum Administration for War and others concerned with evaluation of crude oils and base stocks, analyses of naphthas, and improvement of marginal base stock quality. Constituents of asphalts were studied so that they, like those in aviation fuels, may be compounded to meet exacting requirements.

Work undertaken to give industry fundamental data on thermodynamics of hydrocarbons progressed satisfactorily, and combustion heats of 10 hydrocarbons in the lubricating-oil range of petroleum were determined.

A field pilot plant was built and initial tests were made to remove microcrystalline wax from tank bottoms. Used for munitions and other war products, it accumulates at the rate of 3 million barrels a year in the midcontinent area alone.

Laboratory and field tests developed many innovations in mixing and controlling oil-base drilling fluids and aided operators materially in improving the wall-building and water-loss properties of the fluids, thus effecting economies in the use of steel casing.

An oil-shale research program, authorized by the Synthetic Liquid Fuels Act (Public, 290), has increased the scope of the Bureau's research toward making petroleum and its products available at lower cost through more efficient extraction.

Helium

With the completion of three new plants, the helium-production facilities of the Bureau of Mines met all the requirements of the armed forces and made large quantities of this lightweight, noninflammable "miracle" gas available to commercial purchasers for industrial, medical, and experimental uses.

In January 1944, the Bureau's helium plants at Amarillo and Exell, Tex., were awarded the Army and Navy "E" for their outstanding performances.

Quantity production of helium, the gas which gives buoyancy to antisubmarine patrol blimps and meteorological and barrage balloons, has made possible its use as a shield in the welding of magnesium, aluminum, and alloy steel and has changed radically many procedures in fabricating airplanes and other war equipment. Important medical developments dependent upon assured supplies of helium include the elimination of explosion hazards of anesthetics and the alleviation of certain respiratory ailments.

To conserve helium for these and many new uses being developed for the post-war world, the Bureau of Mines is replacing in nature's underground storage vaults excess supplies processed from the natural gas destined for commercial fuel markets. Otherwise, this helium would be lost forever.

Petroleum and Natural Gas

Many important war assignments on petroleum and natural gas have been carried out, and the Bureau of Mines has contributed to post-war needs with each achievement because research in this field must be conducted along the same general lines, whether the results be applied in war or peace.

Despite handicaps, war missions were fulfilled on four major fronts: primary extraction of oil, secondary recovery, chemistry and refining, and helium production.

Manpower shortages were encountered, together with difficulties in obtaining equipment needed to test flowing wells, but the Bureau's small staff of petroleum engineers supplied basic knowledge and applied technical skill to the operation of condensate and other types of fields engaged in primary extraction of oil. Five engineering reports on Gulf coast fields and three others on the flow characteristics and properties of the fluids in separate reservoirs were supplied to the Petroleum Administration for War and the operators in response to a need for specific facts and figures, and aided the entire war program. Subsurface surveys were made in two important Rocky Mountain fields to permit the formation of plans to operate them at high rates of production, and research was continued on the effect of well spacing on oil recovery.

To supply more oil for war by secondary recovery—stimulative methods of production in fields where nature no longer drives oil to the wells—Bureau engineers disseminated information of modern engineering practices among the 15,000 oil operators of the Appalachian region; surveyed water-flooding projects in Oklahoma, Kansas, and Illinois; studied air- and gas-injection in Illinois; and collected data on water flooding of limestone reservoirs, a subject on which little information has been available. Laboratory research continued on mechanical and solvent extraction of oil from impregnated surface and near-surface deposits, and experiments were made on reducing the cost of lifting oil from vertical wells by introducing the use of siphons on properties where air and gas are injected. A report was begun on observations of a project in Venango County, Pa., where horizontal holes are being drilled into the oil sand from a vertical shaft. Many of the Bureau's findings on secondary recovery will prolong the period in which the United States can depend upon natural crude-oil deposits as its main source of petroleum for liquid fuels and chemical products.

Hitherto unknown sources of base stock and high-octane components for blending into aviation gasoline were disclosed by the Bureau's chemical and refining research. This information aided the Petroleum Administration for War and the refiners materially in meeting the needs of war for aviation fuel, toluene used in the manufacture of explosives, and other petroleum products.

More than 40 reports were submitted during the year to the Petroleum Administration for War and others concerned with evaluation of crude oils and base stocks, analyses of naphthas, and improvement of marginal base stock quality. Constituents of asphalts were studied so that they, like those in aviation fuels, may be compounded to meet exacting requirements.

Work undertaken to give industry fundamental data on thermodynamics of hydrocarbons progressed satisfactorily, and combustion heats of 10 hydrocarbons in the lubricating-oil range of petroleum were determined.

A field pilot plant was built and initial tests were made to remove microcrystalline wax from tank bottoms. Used for munitions and other war products, it accumulates at the rate of 3 million barrels a year in the midcontinent area alone.

Laboratory and field tests developed many innovations in mixing and controlling oil-base drilling fluids and aided operators materially in improving the wall-building and water-loss properties of the fluids, thus effecting economies in the use of steel casing.

An oil-shale research program, authorized by the Synthetic Liquid Fuels Act (Public, 290), has increased the scope of the Bureau's research toward making petroleum and its products available at lower cost through more efficient extraction.

Helium

With the completion of three new plants, the helium-production facilities of the Bureau of Mines met all the requirements of the armed forces and made large quantities of this lightweight, noninflammable "miracle" gas available to commercial purchasers for industrial, medical, and experimental uses.

In January 1944, the Bureau's helium plants at Amarillo and Exell, Tex., were awarded the Army and Navy "E" for their outstanding performances.

Quantity production of helium, the gas which gives buoyancy to antisubmarine patrol blimps and meteorological and barrage balloons, has made possible its use as a shield in the welding of magnesium, aluminum, and alloy steel and has changed radically many procedures in fabricating airplanes and other war equipment. Important medical developments dependent upon assured supplies of helium include the elimination of explosion hazards of anesthetics and the alleviation of certain respiratory ailments.

To conserve helium for these and many new uses being developed for the post-war world, the Bureau of Mines is replacing in nature's underground storage vaults excess supplies processed from the natural gas destined for commercial fuel markets. Otherwise, this helium would be lost forever.

Explosives

Promoting safety and efficiency in the manufacture and handling of explosives in war and for the peace to come, the Bureau of Mines conducted many research and testing projects for the armed forces and for the mineral industries.

More than 4,000 analyses and tests were made during the year including 220 chemical analyses, about 1,000 gallery tests, and more than 3,000 other control tests. Among the subjects for research were incendiary bombs, artillery shells, practice mines, railroad torpedoes, dynamite mixtures, black powder, camouflage nets, aerosols for control of insects, and defects in carbide specifications and acetylene generator operations.

At the request of such agencies as Army Ordnance, the Army Engineer Board, Chemical Warfare Service, Navy Department, and War Relocation Authority Board of Economic Warfare, problems were solved on the stability of explosives materials under impact, friction, confinement, and high temperatures, and certain conditions of electrical environment and exposure. The hitherto unavailable information was applied immediately in safeguarding essential manufacturing facilities and in designing front-line munitions. While primarily for military explosives and pyrotechnics, the information will be of major importance to the peacetime industry.

To counter fire and explosion hazards, inflammability and explosibility factors were determined for industrial organic chemicals in the tremendously expanded textile, synthetic rubber, and plastic industries which will have major roles in the post-war world. As an imperative wartime construction, control measures were started to curb acetylene-generator explosions which threatened seriously in West Coast shipyard operations.

Diesel mine locomotives, when designed especially to prevent explosions or the development of toxic gas conditions, offer distinct advantages in many mining operations. To encourage their use while maintaining safe conditions in post-war mine development, a schedule was prepared governing the testing and approval of such locomotives. Testing was continued to maintain quality in explosives, particularly those used in coal mining.

SAFETY, PLANT PROTECTION, AND HEALTH ACTIVITIES

Wartime emphasis on the health and accident-prevention projects of the Bureau of Mines to conserve manpower and promote the production of raw materials for armies and fleets has opened a new channel for sweeping advancements in industrial safety when peace returns.

Numerous handicaps—increased production, longer hours, employment of older and inexperienced workers, shortages of repair parts, and inability to obtain replacements for faulty equipment—faced the mineral industries last year, but accident rates in the industry as a whole increased but slightly; in some activities they even declined. Having proven what can be done through intensive safety education, accident-prevention work, investigative and research activities, and by laboratory testing of equipment before use, the Bureau predicts greater achievements in the post-war period when many of the current adverse conditions and handicaps are erased.

Under the Bureau's wartime security programs, safer storage, handling, transportation, and use of explosives evolved from the administration of the Federal Explosives Act. The antisabotage activities of the mineral production security staff were so successful, due to the cooperation of industry, that the program has been curtailed.

SAFETY WORK

With many years of experience at their command, the Bureau's safety experts constituted a foundation for the coal-mine inspection, explosives control, and mineral production security programs, coordinating the administration and directing the field activities of all three in addition to conducting safety education, assisting at mine fires and explosions, and making investigations of accidents and means of preventing them.

Laying the groundwork for a new era of industrial safety after the war, engineers and safety instructors during 1944 trained nearly 25,000 employees of the mining and affiliated industries in first aid, increasing to 1,609,239 the number completing these courses since the Bureau was established in 1910. About 230 persons were trained as first-aid instructors, completing a force of nearly 17,000 qualified to teach Bureau procedures. Certificates were awarded to 40 mines and plants in which all employees had received first-aid instruction, and Bureau personnel aided in conducting 10 first-aid contests in 4 States. Mine-rescue instruction was given to nearly 2,800 mine workers, swelling the ranks of those so trained to 80,504. Familiar with the rescue equipment and safe procedures essential in saving lives when fires, explosions, and other disasters occur, these men form an efficient reserve on call for rescue work and possible civilian defense emergencies.

Assisting in rescue and recovery operations, frequently arduous and dangerous, Bureau engineers investigated 30 mine explosions in 10 States and Alaska, 47 mine fires in 18 States, and 142 miscellaneous accidents in 27 States and Alaska during the year. One Bureau of Mines safety expert lost his life last year during recovery operations following a mine explosion. At the request of the owners, rigid

inspections were made of 75 privately maintained mine-rescue stations.

The Bureau's accident-prevention instruction registered new enrollment gains, complete courses being taken by about 1,600 workers and officials and partial courses by about 670, representing the coal mining, metal mining, and petroleum industries. Motion pictures, slides, exhibits, testing galleries, and other equipment were employed in the safety education program. Sound motion pictures on safety subjects were shown more than 500 times during the year, and Bureau representatives attended more than 600 safety meetings in 37 States.

Continuing its investigations and test work to determine the safety of electrical equipment for use in mines, the Bureau approved 37 complete units and issued 12 letters of suitability concerning separate explosion-proof parts for use on approved equipment. Explosion tests conducted during these investigations totaled nearly 2,000. In addition, about 900 explosion tests were made for the Navy Department on equipment intended for ships and munitions plants, and a special study also was made for the Navy on toxic gases emitted by over-heated electrical conductors.

Safety activities of the Bureau have many ramifications, and numerous special investigations were undertaken to determine the causes of explosions, fires, and asphyxiations in war plants and to help minimize hazards involving various gases and dusts.

COAL-MINE INSPECTION

Despite wartime conditions adversely affecting all safety efforts, fatality rates in the Nation's coal mines have declined to the lowest point in history—indicating the salutary effects of the thousands of improvements in practices and conditions established under the Federal coal-mine inspection program, the success of which hinges on the cooperation and assistance of State inspectors and the aid of mine operators and their employees. At the same time, a reduction in accidents has conserved manpower and aided an industry vitally essential to the prosecution of the war.

From the inception of the Bureau's inspection program on December 1, 1941, to the end of the fiscal year, Federal inspectors had examined nearly 2,500 mines for the first time, reinspected some 1,200 mines once, about 200 a second time, and 3 for the third time. Mines inspected at least once produce a total of nearly 600 million tons of coal and employ about 96 percent of all coal-mine workers. The number of mines inspected each month continued to increase as the inspection force became more proficient and as changes were made in inspection procedure.

The Bureau safety standards for anthracite and for bituminous coal and lignite mines were revised during the fiscal year to cover changed conditions directly related to the war.

The accident-frequency rate in coal mines reinspected by Bureau representatives has declined approximately 6 percent, and it is significant that only one major explosion and one major fire disaster occurred during the first 6 months of 1944 when fatality rates reached their lowest ebb in coal-mining annals. This record was achieved in the face of numerous handicaps: increase in the average age of mine workers from 32 to 45, employment of inexperienced men to replace those lost to war plants and the armed forces, a greater effort by workers resulting in physical and mental fatigue, and a shortage of repair parts and new equipment to recondition or replace worn and unsafe facilities.

The inspection staff and the Bureau's mining-explosive and mining-electrical engineers also maintained a consulting service for small operators confronted with particular safety problems, supervised experimental work on devices and procedures designed to improve safety, conducted experiments on permissible explosives, made special studies in connection with the use of explosives and electricity in mines, and prepared reports and pamphlets on safety subjects for the guidance of the mining industry.

EXPLOSIVES REGULATION

Although millions of pounds of nonmilitary explosives were used by American industries last year, no clear-cut cases of sabotage involving blasting materials were reported to the Bureau of Mines, the Federal agency designated by Congress to maintain strict control over such explosives and their ingredients.

License revocation proceedings were brought against only 16 persons, compared with 40 in the previous year. However, two cases involved possible disloyalty, a question that did not arise in 1943. Most storage violations result from ignorance of Federal requirements. Twelve licenses were revoked, and in some instances fines up to \$300 and prison sentences up to 2 years were imposed.

Administering the Federal Explosives Act through an organization of 4,100 cooperating licensing agents serving without pay, the Bureau by the end of the 1944 fiscal year had approved more than 500,000 licenses, including reissuances. Explosives investigators, aided by other Bureau personnel, reported on approximately 6,000 stores of explosives, and nearly 9,000 letters of instructions were sent to licensees.

To simplify procedures for licensing agents and the public, and to aid in administration, new application and license forms were prepared, amendments to regulations were issued, and the text of the act, regulations, and amendments, together with safety suggestions for handling explosives, were distributed under one cover.

Cooperation maintained with military authorities, the Federal Bureau of Investigation, and State and local law-enforcement officers made the functioning and administration of the program increasingly effective.

ANTISABOTAGE

A record unblemished by a single known case of sabotage during the present war has been maintained by the Nation's mineral industries, cooperating with law-enforcement officers, the armed forces, and the mineral production security program of the Bureau of Mines. In fact, the Bureau's program has been so effective that it now can be modified and the emphasis shifted to prevention of production losses from fires and accidents instead of subversive activities. Personnel has been reduced more than 50 percent, coal-mine security activities have been transferred to the coal-mine inspection staff, and metal-mine security work has been curtailed.

However, at the request of the Provost Marshal General's office, some of the Bureau's specially trained engineers have replaced Army officials in conducting recurring inspections of most mines and related facilities labeled essential by the War Production Board. Accident-prevention courses for supervisory officials of large metal mines and plants also will be continued, together with explosives-magazine inspections.

During the year the Federal engineers inspected nearly 1,000 mines, mills, and smelters and assisted the operators in establishing adequate security standards. They also made more than 1,000 reinspections, visiting some facilities several times to insure the correction of unsatisfactory security conditions and thus aid in maintenance of war-mineral production. Some inspections were made jointly with War Department representatives at mines and related facilities on the Army's "master responsibility list." Hundreds of other mines were visited, and reports were submitted on approximately 2,800 explosives magazines in connection with the Federal Explosives Act.

HEALTH IN THE MINERALS INDUSTRIES

Confidential wartime studies by the Bureau of various precision instruments now protecting the lives of Americans on the Navy's fighting ships and in military establishments will be available to improve

working environments in post-war mineral industries confronted with the huge task of filling deferred civilian demands for materials of all types.

Other advancements of the fiscal year included the development of a new dust-sampling device, improvements in a microprojector to facilitate the collection and determination of the amount of harmful dust in the air, and progress in the application of the X-ray and petrographic methods in analyzing dusts and ores from a health standpoint.

In addition to the development and improvement of apparatus for determining the amount and composition of such atmospheric contaminants as noxious gases, fumes, and dusts, the health work of the Bureau, directed mainly toward preventing occupational disease and improving the efficiency of workers, included studies of properties and sources of atmospheric contaminants, evaluation of the harmful or dangerous character of atmospheric environment, and control of unhygienic conditions.

Inspections were made and recommendations prepared on the hygienic conditions in coal and metal mines, at two Army posts, a steel plant, an engine-manufacturing plant, and an electric power plant. In the laboratory, a research project revealed that toxic and explosive gases are liberated when organic insulating material is decomposed by an electric arc.

In assisting its field and laboratory investigations, the Bureau analyzed approximately 16,000 air samples, involving more than 100,000 determinations, and also tested 555 air samples from fire areas in coal and metal mines. Thirty-eight air and gas analyses were made for the Army and 708 for the Navy, and about 1,000 determinations were required on dust and source material collected during coal-mine inspections and other Bureau investigations conducted to help control health and explosion hazards in mines and plants of the mineral industries.

Approval-testing of all types of respirators continued. Meanwhile, the information collected from 1933 to 1942 during a program of sealing abandoned mines to control acid mine drainage was analyzed to aid in a possible post-war program on this problem. The first draft of an approval schedule for Diesel mine locomotives was completed and was submitted to other Bureau personnel and to industry for critical review.

ECONOMICS OF MINERAL INDUSTRIES

As the United Nations' war machine rolled relentlessly forward to new goals, changes in the production-and-demand scene in mineral commodities, both foreign and domestic, caused war agencies to rely

more heavily on the long-established statistical and economic work of the Bureau of Mines for authoritative information, particularly in the field of foreign minerals. The emphasis on foreign minerals in the post-war era required an increase in the Bureau's staff of foreign mineral specialists.

Threatened coal shortages impelled the Solid Fuels Administration for War to ask for more information on supplies in critical areas and the outlook for production and future demand. All these requests, along with others on primary and secondary metals, chemical raw materials, fertilizers, and petroleum were met speedily.

Governmental efforts to balance mineral supplies against requirements were successful in many instances during the year and, with the exception of fuels, pressure for additional production or conservation was relaxed. For many commodities it was possible even to effect reconversion and post-war problems in which the Bureau's fact-finding services are as essential as they were in planning the war program.

Seeking a more effective organization for the postwar responsibilities of assuring adequate supplies for the anticipated advance in living standards, the Department of the Interior during the year consolidated all of its mineral economic services in the Bureau of Mines.

METALS

Adequate supplies of virtually all metals needed for war and essential civilian uses were assured during the fiscal year by the continued expansion of domestic production and increased imports of base metals and ores. Analyses of the thousands of voluntary reports from industry on production, stocks, and consumption of nearly 400 commodities disclosed a gradual improvement in the supply-demand requirement position of nearly all major war metals, although they declined slightly during the last 6 months of the fiscal year, but due to manpower shortages.

The Bureau of Mines continued to prepare confidential reports on these surveys for the use of war agencies, and war censorship authorities permitted a larger number of these studies to be made public. Invaluable to agencies concerned with war supply problems, the factual monthly and quarterly metal summaries will serve an equally important purpose in the post-war period, and the service will be extended to industry and the public as rapidly as censorship requirements are relaxed.

Disposal of Government-held inventories of metal and minerals present one of the most complex post-war problems. Prepared for peace as it did for war, the Bureau of Mines will be ready to

comprehensive information needed for the solution of this and other reconversion problems, including the status of marginal producers, unemployment resulting from possible curtailment of production, the accelerated depletion of domestic reserves, and the competitive situation between metals.

NONMETALLICS

As in the years past, the Bureau of Mines compiled and distributed periodic reports on commercially important nonmetallic minerals and their primary products. Special emphasis again was given those having critical war uses, and field investigations were made by Bureau specialists when acute shortages developed in some commodities. Reports were prepared on many vital nonmetallic war minerals, including mica, asbestos, sulfur, fertilizers, quartz crystals, graphite, and abrasives.

Markets for building materials dropped sharply as the mobilization program passed from the construction to the production phase; at the same time, the demand for chemical raw materials, fertilizers, and many other nonmetallics reached record heights under the stimulus of war. In consequence, as the year progressed and the supply-demand relationships eased, an increasing number of requests for information bearing on reconversion and post-war problems were received by the Bureau's experts in the field of nonmetallics. Both industry and Government became more aware of the need for market analyses—adequate information on uses, supply, and potential demand—to be used as guides in the establishment of company and public policies. Much of this information is available in chapters of the Bureau's Minerals Yearbook and other published reports, but some amplification will be required to supply additional facts desired by producers and consumers of chemical raw materials, fertilizers, and building materials.

PETROLEUM AND NATURAL GAS

Uniformly essential in providing the basic current and annual reports required by war agencies, the Bureau's normal functions as a storehouse of information on petroleum and natural-gas economics have been expanded and regeared to new and pressing wartime needs.

The most important additions to its work have evolved from the increasing complexity of refinery operations required to fill the demands of the machines and plants of war for fuels, lubricants, and other petroleum products. Monthly surveys on the production and distribution of aviation gasoline were revised and improved. The monthly canvass covering products of natural gasoline and cycle plants, required as blending agents for aviation gasoline and as ma-

terial for synthetic rubber, was enlarged and adjusted to current requirements.

Forecasts of demand for motor fuel and crude oil have supplied an accurate barometer of the wartime changes in national consumption and estimates of the demand for domestic crude petroleum by States of origin have given the Petroleum Administration for War a gage for determining desirable rates of production.

The Bureau has cooperated in preparing reports on the reserves of crude petroleum and natural gas in relation to present and future national supply, and its accumulated information on foreign oil production and international trade has been of outstanding value to agencies concerned with war and post-war supply. Reports and economic studies of the Bureau are of particular aid in interpreting the effect of the war on the long-term trends of the oil and natural-gas industries.

COAL

Continued shortages of anthracite and domestic coke, accelerated demand for metallurgical coke, and increased requirements for light oil and coal-tar derivatives for the manufacture of explosives, synthetic rubber, aviation gasoline, plastics, and pharmaceuticals required that the Bureau of Mines continue special surveys previously initiated, expand others, and inaugurate new studies. This vital information, requested by the War Production Board, Solid Fuels Administration for War, and other war agencies, provided the basis of the program for the equitable distribution of anthracite and permitted control of prices and allocation of coke byproducts to war plants.

Detailed information on production, import and export trade, and solid-fuel requirements of Eastern Europe and North Africa was prepared for the War and Navy Departments; and the well-established weekly, monthly, and annual domestic reports were published during the year, but with some deletions due to censorship regulations.

Effective May 30, 1944, the extensive economics and statistics facilities of the Solid Fuels Administration for War were transferred to the Bureau of Mines, thus expanding the Bureau's coverage to include the economics of the bituminous coal industry. Thus, the Bureau now can give industry and Government virtually complete coal economics service. With minor adjustments, the war program in this field will be essential in helping solve problems of the post-war era.

FOREIGN MINERALS

Being geared for the post-war world, the work of the Bureau of Mines on foreign mineral economics was expanded during the year to include studies of foreign mineral resources with special reference to their importance in international relationships during the next few years.

Information was earmarked for Government agencies responsible for the solution of post-war problems of an international nature, including economic relief and rehabilitation of liberated areas, political and commercial control of world minerals, and equitable distribution of world output. Such pertinent information also is in demand by agencies concerned with the twofold problem of obtaining from foreign sources adequate supplies of minerals not available domestically in sufficient quantities and with adjusting the Nation's mineral procurement program after the war, particularly with Latin American countries.

ACCIDENT AND EMPLOYMENT DATA

Paralleling the annual statistical surveys of mineral production was the Bureau of Mines' Nation-wide canvass of mines, quarries, mills, smelters, and coke ovens to obtain facts on the number and causes of accidents, and the number of employees and man-hours worked.

This information, collected for many years as an essential part of the Bureau's accident-prevention activities, will be equally useful during and after the conversion to peacetime operations.

Using the information during the last fiscal year in formulating military and civilian programs, war agencies found particularly helpful the facts provided on the location of mines producing minerals needed for war, the productivity per man-hour as related to the Government's over-all policy of manpower conservation, the extent of employment at mines and quarries producing minerals unessential to the prosecution of the war, and other facts concerning matters affecting the mineral industry and its absorption of manpower.

This program was elevated to divisional status in the Bureau organization during the year because of the growing importance of accident prevention and the anticipated intensification of efforts to improve the accident record of mineral industries in the post-war period.

PUBLIC REPORTS

Requests from industry, governmental war agencies, and the public for informative material on all phases of the mineral industries continued to increase during 1944. Although many additional reports were published, the number of copies printed and distributed was restricted in keeping with a policy of rigid economy established during the previous fiscal year, and the total volume of pieces issued remained virtually unchanged. The Minerals Yearbook again was classed confidential and was not distributed generally.

In all, 512 bulletins, technical papers, handbooks, Minerals Yearbook chapters, and contributions to technical journals were prepared, together with many hundreds of periodic reports of a statistical nature

to serve industry. Thousands of letters were written in response to mail and telephone requests for information.

The Bureau's Washington library of selected reference material was increased by approximately 2,500 books; about 230 different periodicals, many on an exchange basis, were received regularly; and 25,200 books and periodicals were circulated for use outside the library. In addition to regular accessions, about 3,000 books and pamphlets were being transferred to the library from the Coal Economics Division, which acquired them from Solid Fuels Administration for War. The Washington library now has about 60,000 books.

During the year, some 6,000 readers visited the library for reference work and approximately 6,000 telephone calls were received. Nearly half of both readers and calls were from war agencies and other sources outside the Bureau.

The Bureau's free educational motion pictures, produced with funds contributed by private industry, were shown in the United States and many foreign countries on 93,586 occasions during the year to audiences totaling 7,691,166 persons. Showings in educational institutions decreased, but this decrease was largely offset by increased showings in industrial plants. Since 1922, the Bureau's films have been shown on 1,112,338 occasions to audiences totaling 115,878,059 persons. Seven new sound films were added to the Bureau's library of 10,000 reels.

ADMINISTRATION

As in past years, activities of the Bureau of Mines were administered from Washington, D. C., but were carried on largely in the field offices, laboratories, and pilot plants. For greater efficiency, many payments of salaries and vendor bills were made by the Treasury Department's regional disbursing officers nearest to field projects. Wage board procedures were put into effect at the Electrometallurgical Laboratory in Boulder City, Nev., and at the helium plants at Amarillo and Exell, Tex.; Otis and Cunningham, Kans.; and Shiprock, N. Mex.

PERSONNEL

On June 30, 1944, there were 4,300 full-time employees of the Bureau of Mines, distributed as follows:

Classification and number of appointees

	P&S	SP ¹	CAF	CPC ²	Total
Department.....	137	8	635	5	785
Field.....	705	311	1,055	1,444	3,515
Total.....	842	319	1,690	1,449	4,300

¹ Includes instrument makers, safety instructors, laboratory aids, assistants, etc.

² Includes laborers, mechanics, messengers, etc.

PROPERTY

As of June 30, 1944, the property of the Bureau had a total valuation of \$8,485,533.37, of which \$2,533,869.06 was for land, buildings, and improvements; \$1,681,168.88 for laboratory equipment; \$1,540,665.36 for machinery and power plant equipment; and the remainder for certain helium properties, office furniture and equipment, automobiles and trucks, rescue cars and specialized apparatus, and other goods.

FINANCE

Total funds available to the Bureau of Mines for the fiscal year ended June 30, 1944, including direct appropriations, departmental allotments, reappropriated balances, and sums transferred from other departments for service work, were \$25,476,222. Of this, \$19,821,562 was spent, leaving an unexpended balance of \$5,654,660. These figures are subject to revision because of unpaid obligations.

Table 1 presents classified information regarding the financial history of the Bureau for the fiscal years June 30, 1941-45.

Table 2 gives a statement of the distribution of congressional appropriations to the services and divisions and the expenditure of these funds in 1944 by Bureau divisions.

TABLE 1.—Bureau of Mines appropriations and expenditures, fiscal years ended June 30, 1941-45

Fiscal year	Appropriated to Bureau of Mines	Departmental allotments ¹	Funds transferred from other departments ²	Total funds available for expenditure	Unexpended balances	Total expenditures	Expenditures, exclusive of service items ³
1941.....	\$3,944,400.95	\$91,790	\$2,225,939.10	\$6,262,130.05	\$1,069,298.98	\$5,192,831.07	\$4,934,951.05
1942.....	8,910,388.68	97,490	2,223,026.41	11,230,905.09	1,823,415.21	9,407,489.88	8,747,726.21

Geological Survey

W. E. WRATHER, Director

MODERN wars are not won by a single battle or even on a single front. Though each battle must be fought with vigor and the intent to win, the planning staff and the field command would indeed be short-sighted if they squandered on one engagement too much of their power in men and munitions. On the contrary, they must plan for an entire campaign, must hold in reserve the forces that will be required for other battles, and, by endeavoring to hold the initiative, must gradually evolve a broad strategic pattern that will lead to final victory. Both the intelligence service and the planning staff must focus much thought on future engagements far behind the enemy's present lines.

The Geological Survey must endeavor to be similarly forward-looking.

Of necessity, most of the Survey's energy since Pearl Harbor has been devoted to immediate objectives—the many tasks that contribute directly to the winning of the war. Those tasks have included investigations, both in this country and abroad, of sources of the metals, minerals, and fuels that must be made available in seemingly endless amounts to provide the munitions and machines of war; the research for and preparation of confidential technical reports on foreign combat terrains, required by the military planning staffs and the fighting forces; the analysis of complex problems of water supply for military installations and for plants engaged in making the implements of war; and the mapping of millions of square miles in this country, in Alaska, and on other continents, to provide the countless maps needed by the armed forces and by our military and commercial planes in world-wide air-transport service.

However, the Survey has endeavored to plan and execute its work in such manner that the results would not only meet the day-by-day war

Geological Survey

W. E. WRATHER, Director

MODERN wars are not won by a single battle or even on a single front. Though each battle must be fought with vigor and the intent to win, the planning staff and the field command would indeed be short-sighted if they squandered on one engagement too much of their power in men and munitions. On the contrary, they must plan for an entire campaign, must hold in reserve the forces that will be required for other battles, and, by endeavoring to hold the initiative, must gradually evolve a broad strategic pattern that will lead to final victory. Both the intelligence service and the planning staff must focus much thought on future engagements far behind the enemy's present lines.

The Geological Survey must endeavor to be similarly forward-looking.

Of necessity, most of the Survey's energy since Pearl Harbor has been devoted to immediate objectives—the many tasks that contribute directly to the winning of the war. Those tasks have included investigations, both in this country and abroad, of sources of the metals, minerals, and fuels that must be made available in seemingly endless amounts to provide the munitions and machines of war; the research for and preparation of confidential technical reports on foreign combat terrains; required by the military planning staffs and the fighting forces; the analysis of complex problems of water supply for military installations and for plants engaged in making the implements of war; and the mapping of millions of square miles in this country, in Alaska, and on other continents, to provide the countless maps needed by the armed forces and by our military and commercial planes in world-wide air-transport service.

However, the Survey has endeavored to plan and execute its work in such manner that the results would not only meet the day-by-day war

demands but would also be of greatest usefulness in the campaigns yet to come. Its engineers and scientists must be, and within the limits of its present means are, an "intelligence service" for the far-sighted gathering of basic information needed now and in the future by the Nation's "planning staff," both governmental and private.

To achieve an enduring peace this Nation is pouring out its wealth of manpower and resources without stint or hesitation. When peace comes this country must assume its part in rebuilding a war-torn world. Even now, Federal and State Governments and industry are devoting serious thought to plans for demobilization, reconversion, and post-war development. For the conception and perfection of sound plans, as well as for the later successful accomplishment of many public and private development projects, those planning agencies must have access at the earliest possible time to all needed information on our mineral resources, which have been seriously depleted by war demands; on the flow of rivers and the amounts of surface and underground waters that can be made available for municipal and industrial uses and for irrigation, flood-control, and power projects; and on the nature of the terrain as shown with engineering accuracy on detailed topographic maps.

The gathering of such information and the preparation of reports and maps are functions of the Geological Survey. Much material is already available through the work of earlier peacetime years; other material has been gathered as a byproduct of its urgent war studies but is still largely undigested and not generally accessible; and many investigations and surveys remain to be made. If the planners for post-war reconstruction are not to be gravely handicapped but are to have the fundamental information available in time to be of value, the Geological Survey should be enabled to proceed at once with the full analysis and coordination of the data now in its files and with the most pressing of the additional investigations and surveys. To postpone these tasks until the end of the war would be extremely short-sighted, if not disastrous. They should be undertaken immediately, for they are fully as urgent and practical as the direct war jobs that must be continued.

GEOLOGIC BRANCH

During the past year the Geologic Branch has been fully on a war basis. For the duration this situation will necessarily continue, but it is essential that plans be prepared now to adjust the Branch's work to assist in solving the problems that will face this country in the post-war period and to orient the war work, insofar as that is possible, in such ways as will permit its results to contribute also to the conversion period. The normal demand for minerals, greatly accelerated by war activities, has resulted in an alarming depletion of the supply of many of the basic materials upon which our economy is built. As the richer deposits of minerals are exhausted, more reliance must be

placed on exploration for deposits that are concealed or only obscurely indicated, on deposits of lower grade, and on improved technique in recovering those lower-grade materials. Industry is primarily interested only in those resources that can be exploited at a profit and in peacetime pays scant attention to large reserves of ores and minerals that are below commercial grade. Yet in times of national emergency these low-grade deposits may be the only available sources of vitally needed raw materials. It is a function of the Geological Survey to keep an inventory of all reserves of mineral commodities. During the year Survey geologists have completed the examination of many hundreds of deposits and made preliminary estimates of the national reserves of some 15 or 20 mineral commodities. This inventory should be kept current and broadened.

The rapid depletion of our supplies of petroleum, natural gas, and coal is a matter of grave national concern. The Survey, with its skilled force of geologists, paleontologists, chemists, and petrographers, is the organization best qualified to carry out basic field studies on the stratigraphy and geologic structure of large areas to discover and define those wherein it may be profitable to prospect for new supplies of mineral fuels. These studies should be still further expanded as promptly as possible.

WAR MINERALS

For the 3 years prior to the summer of 1942, principal emphasis was placed by the Geologic Branch upon the search for and appraisal of domestic deposits of the metals and minerals originally classified by the Army and Navy Munitions Board as "strategic" and "critical." With the success of the antisubmarine campaign through the winter of 1942-43 large imports of these commodities began to arrive regularly, and by the fall of 1943 the pressure for domestic production of some of them began to ease. It became apparent, however, that domestic reserves of some of the common metals were being seriously depleted, and geologic personnel was gradually shifted from work on some of the original "strategic" metal deposits to work in districts that held out hope for developing noteworthy new reserves of the common metals. Attention was focused on such zinc districts as Metaline, Wash., Pioche and Goodsprings, Nev., Eureka, Utah, southwestern Wisconsin, and eastern Tennessee, and on the copper districts in the Foothills Belt, Calif., Globe, Ariz., and Michigan. In most of these districts the Geological Survey's work led to recommendations for exploration by the Bureau of Mines, which has been especially successful in Washington, Wisconsin, and eastern Tennessee. Work has been continued in many strategic metal districts to complete studies initiated earlier and to obtain data currently desired by the war agencies, as in the southeastern and western manga-

nese districts; the Almaden and Oat Hill mercury deposits, California; the tungsten districts of Pine Creek, Calif., Mill City, Nev., and Yellow Pine, Idaho; and the vanadium districts of southeastern Idaho and Colorado-Utah.

The object in studying bauxite deposits has been twofold—to relieve the critical shortage of this, the only commercial source of aluminum, by aiding private companies in discovering and delimiting new areas, and to give an accurate appraisal of our resources so that they can be used more wisely in the post-war period as well as in the war emergency. Detailed surveys of areas containing bauxite were continued in nine areas in the Gulf Coastal Plain. Final reports, with geologic and prospecting maps, have been submitted for all these areas except Arkansas, where drilling and mapping is still in progress, and for part of Mississippi, a report on which is still in a preliminary stage. In Saline and Pulaski Counties, Ark., the cooperative drilling program of the Geological Survey and the Bureau of Mines during the fiscal year 1943-44 delimited more than 11 million tons of bauxite of commercial grade.

The search for sources of aluminum and magnesium covered the country from coast to coast and included studies of deposits of alunite, high-alumina clay, magnesite, dolomite, and brucite, in addition to the intensive work on bauxite. More than 250 pegmatite deposits containing sheet mica, beryllium, tantalum, lithium, and feldspar were examined in 13 different States, and recommendations were made to the Bureau of Mines for further exploration of a number of these deposits. Other nonmetallic mineral deposits studied included talc, graphite, salt, potash, asbestos, corundum, and quartz crystals.

Studies of iron-ore deposits were carried on in more than 50 separate areas in 20 States. Some of this work was done in cooperation with other Federal and State bureaus or at the specific request of other Government agencies. Work was carried ahead to obtain information that will be essential to insure a supply after the war, when deposits of inferior quality and small reserves may become producers. Investigations of districts in which appreciable reserves appear to be indicated included those made in the Iron River and Crystal Falls districts of Michigan, the Adirondack region of New York, and the Highlands region of New York-New Jersey.

Owing to greatly increased demands for fluorspar for war uses, consequent depletion of national resources, and likely continuance of an augmented demand for new civilian purposes after the war, fluorspar investigations were pushed energetically and enlarged. In addition to the three established parties working in (1) the Kentucky-Illinois district and Tennessee, (2) Colorado, Idaho, Wyoming, and Washington, and (3) New Mexico, Texas, and Arizona, a fourth party was organized to take charge of work on fluorspar in Utah, Nevada, and

California. Temporary parties were assigned to work in northwestern New Mexico and in Montana and northern Idaho.

In the field of mineral fuels attention was directed primarily to the search for new supplies of petroleum. Regional studies were initiated in 23 States to obtain data on the distribution of possible oil-bearing formations and to locate broad areas where conditions in these rocks might be favorable for the accumulation of petroleum. Nearly 100 geologists were engaged in these expanded activities at the end of the year. Ten preliminary maps and charts giving the results of these studies were issued during the year, and others are in preparation. The petroleum investigations, though stimulated by the war and aimed toward the discovery of war fuel supplies, yield basic geologic data of lasting value in the future search for oil and many other natural resources.

Tar sands and asphalt deposits that have considerable potential importance as sources of petroleum were mapped in Oklahoma and California, and preliminary examinations were made of deposits in many other States. This work was conducted in part in collaboration with the Petroleum Administration for War and the Bureau of Mines.

Examination of coal deposits was confined mainly to areas in the West, where expanded war activities have increased the demand for coking and steam coal. Detailed mapping of coal beds was undertaken in Colorado, Nevada, Oregon, and Alabama in conjunction with exploratory drilling by the Bureau of Mines. Coal deposits were also studied in Oklahoma and Washington.

The sections of Chemistry and Physics, Paleontology and Stratigraphy, and Petrology devoted their time mainly to the laboratory study of materials collected by the field geologists who needed this information in the solution of their war minerals supply problems. In the chemical laboratory more than 8,000 tests and analyses were made, and new techniques were developed for field and laboratory determination of many of the rarer elements that have come to have new and secret, either actual or potential, war uses.

AMERICAN REPUBLICS

Investigations of strategic and critical minerals in the American Republics continued. The work was financed in about equal proportions by the Department of State and the Foreign Economic Administration. Close and cordial cooperation continued with Mexican, Cuban, and Brazilian geological agencies, and cooperative field work was begun with the newly formed Bureau of Mines of Haiti and with the minerals agencies in Chile and the Dominican Republic.

Recently discovered aluminous deposits in Haiti were examined, and prospecting was done in the Dominican Republic for similar deposits. Investigations of chromite and manganese deposits in Cuba

were continued. In Mexico work on fluorspar, copper, mica, mercury, antimony, manganese, and tungsten was carried on in collaboration with the Instituto de Geología, the Dirección de Minas y Petróleo, and the Commission for the Investigation of Mineral Resources. In Brazil investigations of the mica deposits of Minas Geraes were carried on in cooperation with the Departamento Nacional da Produção Mineral and the United States Purchasing Commission. Investigations of mercury and tungsten deposits in Chile were commenced in cooperation with the Chilean Department of Mines. Survey geologists on detail to the Foreign Economic Administration continued investigations of the resources of Colombia, Guatemala, Nicaragua, and Honduras.

The eruption of the new volcano, Parícutin, in Michoacán, Mexico, provided an opportunity to make many observations of considerable scientific interest.

MILITARY GEOLOGY

During the fiscal year 1943-44, the Military Geology unit has continued to prepare terrain intelligence reports for the Military Intelligence Division, Corps of Engineers, and at their request has increased its staff of professional scientists from 30 to 67. The staff now includes several soils scientists and a forester. At the request of the commander of the Southwest Pacific theater, 4 of these military geologists and 1 soils scientist were assigned to headquarters in Australia to prepare similar reports needed for the planning and conduct of combat operations.

Although virtually all the work of this unit was devoted to the prosecution of the war, several byproducts of post-war usefulness have been planned and, in part, developed. These include atlases of the geology and mineral resources of many foreign countries; a topographic or terrain atlas; an appraisal of the completeness of information in the fields of the earth sciences in the whole Pacific area; and a report that will define the field of engineering geology, including military geology. Plans also were outlined for peacetime continuation of liaison between the Geological Survey and the War and Navy Departments.

ALASKAN BRANCH

Many years ago Patrick Henry in one of his orations reflected the then current idea of the remoteness of lands in what is now Michigan when he described them as "beyond the most distant wilderness and remote as the moon." Seventy-five years ago our grandsires probably thought in somewhat the same terms of Alaska. Indeed, even in the early 1890's it was a venturesome pioneer who was willing to brave the unknown conditions that must be met in casting his lot with the few settlers that then occupied this northland. Now that we have learned

more about Alaska and are more familiar with the details of how its development has taken place we have become increasingly aware that the winning of the great northwest province has been merely a reenactment of the various steps by which the States have come to their present stages. In Alaska some of these steps are now being taken at greatly accelerated rates, because modern tools and devices facilitate the overcoming of many of the handicaps hitherto imposed by distance and time. No longer is there need to rely on slowly plodding ox teams to cross seemingly limitless plains and bring in supplies and settlers to the remote corners of the domain, or to wait for weeks to elapse in the exchange of communications, or to depend solely on man's strength to perform necessary labor. Instead airplanes, radios, and mechanical devices can perform these various acts quickly and effectively.

However, no matter whether the rate is fast or slow, true progress in any development depends on thorough knowledge of the problems involved. Many mistakes in past practices and in formulating our national policies have arisen through inadequate or incorrect information as to the pertinent facts. Wise laws cannot be enacted and put into operation for the conservation and proper utilization of the Nation's potential resources without adequate knowledge of the geographic and geologic factors involved. Businessmen, investors, and workers cannot fulfill their roles in undertaking enterprises without dependable authoritative data. The selection of sites for business and industrial centers, for transportation lines to serve them, for sources of power to operate the various appliances and services now regarded as necessary by civilized man are all closely tied to the physical features of the country, as expressed in terms of its geography and geology. Even the most casual consideration of most projects calls for analysis of many of these factors.

If, then, the pattern of Alaskan development so far has followed closely that of the States, it seems inevitable that its fuller development may also be expected to follow the more advanced developments in the States. With confidence that this expectation is valid, it behooves us to learn and apply the lessons of the past as well as add to our store of knowledge.

What are the services that the Alaskan Branch of the Geological Survey is prepared to furnish? Full answer to this question would require far more space than can be given here. Therefore, let a few examples suffice to illustrate some of the broader aspects of its work.

Consider the Survey's mapping program for Alaska. This program provides for the complete topographic mapping of the Territory. The resulting maps show lakes and rivers in true position and relation to other features; settlements, roads, railroads, houses, and other works of man; and the character of the terrain—the height of hills and depth of valleys. From such maps, measurements of the direction and dis-

tance between places and things are easily and accurately accomplished; gradients along prospective routes for railroads or roads may be compared; the areas above or below sites for catchment or utilization of water may be computed; special information, such as the distribution of timber and agricultural developments, can be plotted; and military maneuvers can be planned.

No less essential but perhaps less well known than the topographic maps are the geologic maps and reports covering parts of Alaska issued by the Geological Survey, which portray and describe the geologic features of various areas. These maps and the geologic reports are indispensable to those whose business involves knowledge of mineral deposits—their location, their mineral content, and their geologic features, which, when understood, may guide operators in their search for extension of known deposits or lead them to discovery of new ones.

Perhaps a clearer idea of the application of these various studies may be gained by considering typical inquiries about Alaska received recently from various governmental agencies, such as the War and Navy Departments, War Production Board, and Petroleum Administration for War, and from citizens and companies throughout the country. One inquirer wants to know about the character, distribution, and extent of permanently frozen ground as affecting problems of construction; another inquires about the quality and quantity of asbestos or some other mineral in a remote part of the Territory; another would like to know the location of mines at which he might find work; another asks for details of the terrain in certain of the Aleutian Islands; another asks whether certain lands are available for entry as coal lands; and another asks what materials are available near a specified point for supplying a new plant for making cement. Many inquiries are for identification of place names not found on generally accessible maps; others are for identification and information as to the mineral content of specimens of rocks; and innumerable inquiries relate to the availability of water supplies for various purposes. Still other requests are for photographs and reports useful in teaching about Alaska or of general educational value relative to its magnificent glaciers, volcanoes, and other natural wonders.

From the foregoing examples of the services that the Alaskan Branch is called on to render it is apparent that utilization of the Survey's assistance should precede any thoughtful analysis of the worth-whileness of most development enterprises. The set-up of the Survey's activities in Alaska to meet post-war conditions must not await the cessation of hostilities, because most post-war plans involving the development of our natural resources and the utilization of our country's physical features should not even be considered until this basic factual material is available. Because of lack of infor-

mation on the geology and geography of Alaska in the past lives have been lost, worth-while enterprises have been laid aside, and contributions of matériel to the Nation's defense and welfare have been far less than they might have been. Now is none too soon to remedy some of these lacks, whether we face years of additional warfare or are planning for America's eventual after-the-war resumption of national leadership.

The principal new field projects that were undertaken during the season of 1943 to furnish information needed in the Nation's war plans dealt with the general supervision and gathering of information on mineral resources in the five principal regions into which Alaska may be divided; namely, southeastern Alaska, Copper River-Prince William Sound, Cook Inlet-Alaska Railroad belt, Kuskokwim, and western Alaska. Specific investigations were in progress in each of these regions. In southeastern Alaska search was made for molybdenite ores in areas adjacent to Prince of Wales Island; for chromium and nickel ores near Cross Sound and Lituya Bay; for copper-iron ores on Kasaan Peninsula; for lead-zinc ores near Wrangell; and for basic intrusive and magnetic rocks at a number of localities. In the Copper River-Prince William Sound region, in addition to a general examination of most of the old copper-producing localities, intensive search for copper deposits was carried on in the Nizina and Kotsina-Kuskulana districts and at Rua Cove. In the Cook Inlet-Alaska Railroad belt specific projects involved intensive examination of parts of the Matanuska-Moose Creek coal fields, of coal deposits near Costello Creek, of the tungsten deposits near Fairbanks, of lead and zinc ores near Mount Eielson, and of the chromite deposits near Seldovia. In the Kuskokwim region the individual projects included detailed studies of the quicksilver deposits near Decourcy Mountain and reconnaissance of the quicksilver deposits near Cinnabar Creek in the Holitna Valley. In western Alaska investigations were continued on the tin resources of western Seward Peninsula and in the Morelock Creek area of the Yukon Valley, and preliminary studies were made of tungsten deposits near Nome and Solomon, of graphite in the Kigluaik Mountains, of asbestos near Shungnak, and of quartz crystals in the Koyukuk Valley.

For the field season of 1944 the same general supervision of the work in the various regions was maintained. The emphasis that was being placed on discovery of oil in Alaska, however, led to establishing a separate unit to handle all projects having to do with that work, irrespective of their geographic location. Petroleum investigations are in progress in five areas—near Yakataga, Katalla, Iniskin, on the Alaska Peninsula, and in northern Alaska. The Alaskan projects involving other mineral commodities are the following: In south-

eastern Alaska investigations are continuing of the copper-iron deposits near Kasaan, Tolstoi, and Copper Mountain, and of lead and zinc deposits in the vicinity of Tracy Arm. In the Copper River region examination is being made of molybdenum-copper deposits in the vicinity of Nabesna. In the Cook Inlet-Alaska Railroad belt contact is being maintained with a number of miscellaneous prospects that are in course of development, and intensive examinations are under way in both the Matanuska and the Healy River coal fields. In the Kuskokwim region general scouting of areas regarded as likely to contain significant deposits of quicksilver minerals is being continued, and a reconnaissance of the reported ore deposits in the Russian Mountains is being made. In western Alaska a reconnaissance is being made of the coal deposits adjacent to Yukon River from Ruby to Kaltag and near Unalakleet on Norton Sound, the investigation of tin deposits in western Seward Peninsula will be continued, and examinations will be made of certain mineral deposits that have been reported near Shungnak, in the Kobuk Valley.

In addition to these projects a large part of the activity of the Branch has been devoted to the extended mapping program being carried on at the request of and with funds provided by the Army Air Forces. This project, which originally was more or less restricted to mapping parts of Alaska, has proved so useful that gradually it has been expanded to include the mapping of large strategic areas in other countries. At the close of the fiscal year the Alaskan Branch had completed from aerial photographs planimetric maps covering nearly 5,500,000 square miles and, as part of the same project, topographic maps covering 500,000 square miles.

TOPOGRAPHIC BRANCH

The headquarters offices of the Topographic Branch and its Atlantic Division are located in Washington, D. C.; the headquarters office of the Central Division is in Rolla, Mo.; and that of the Pacific Division is in Sacramento, Calif. Section offices are maintained in Chattanooga, Tenn., and Clarendon, Va.

GENERAL OFFICE WORK

During the year the regular program of cooperative mapping was carried on with 17 States, Puerto Rico, and the Tennessee Valley Authority, but the Topographic Branch directed a large part of its activity to producing maps for the War Department in both domestic and foreign areas. Many field engineers were detailed to this assignment, which included the revision by means of aerial photographs of maps of foreign territory covering approximately 26,000 square miles and the compilation of contour maps from older hachured maps cover-

ing 13,000 square miles. Existing maps for an area of 43,000 square miles were assembled in changed format and re-drafted. A considerable amount of map shading on scales of 1:1,000,000 and larger was done for special use of the Army Air Forces. This work for the War Department is in addition to that reported by the Section of Photomapping.

Section of Computing.—The office processing of control surveys made for the topographic mapping of strategic areas continued in unusual volume during the year. These computations and adjustments resulted in the issue of lithographed lists of leveling, transit traverse, and triangulation results for 70, 186, and 12 quadrangles, respectively. Bulletin 930-D was published during the year, the fourth and last part of spirit leveling in Illinois. Manuscript was prepared in part for a bulletin on spirit leveling in North Carolina. Computations and adjustments for routine field projects were continued, and the usual volume of control data was assembled and transmitted to comply with requests from field engineers and correspondents.

Section of Photomapping.—This section maintains offices in Washington, D. C., Clarendon, Va., Chattanooga, Tenn., Rolla, Mo., and Sacramento, Calif. Its principal work is the production of topographic maps from aerial photographs by stereophotogrammetric methods and the production of planimetric maps and planimetric bases for topographic field surveys by both stereophotogrammetric and graphic methods.

Topographic maps of areas in the United States produced during the year by these methods covered approximately 7,120 square miles; planimetric and base maps covered approximately 13,900 square miles. Topographic maps of foreign areas were produced from aerial photographs for the War Department; of these, maps covering approximately 10,000 square miles were completely processed for reproduction, and maps covering 2,700 square miles were delivered in manuscript form. These figures do not include work performed in the Chattanooga office, which is engaged on a cooperative project with the Tennessee Valley Authority and the War Department.

At the principal office of the section, in Clarendon, Va., in addition to the large production facilities, which are operating on a two-shift basis, there are also maintained a central laboratory for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment utilized for our stereophotogrammetric work and a photographic laboratory specializing on research and precision photography required for the other offices.

The Washington office maintains a general file of aerial photographs utilized in the work of the Geological Survey and of aerial photo-

eastern Alaska investigations are continuing of the copper-iron deposits near Kasaan, Tolstoi, and Copper Mountain, and of lead and zinc deposits in the vicinity of Tracy Arm. In the Copper River region examination is being made of molybdenum-copper deposits in the vicinity of Nabesna. In the Cook Inlet-Alaska Railroad belt contact is being maintained with a number of miscellaneous prospects that are in course of development, and intensive examinations are under way in both the Matanuska and the Healy River coal fields. In the Kuskokwim region general scouting of areas regarded as likely to contain significant deposits of quicksilver minerals is being continued, and a reconnaissance of the reported ore deposits in the Russian Mountains is being made. In western Alaska a reconnaissance is being made of the coal deposits adjacent to Yukon River from Ruby to Kaltag and near Unalakleet on Norton Sound, the investigation of tin deposits in western Seward Peninsula will be continued, and examinations will be made of certain mineral deposits that have been reported near Shungnak, in the Kobuk Valley.

In addition to these projects a large part of the activity of the Branch has been devoted to the extended mapping program being carried on at the request of and with funds provided by the Army Air Forces. This project, which originally was more or less restricted to mapping parts of Alaska, has proved so useful that gradually it has been expanded to include the mapping of large strategic areas in other countries. At the close of the fiscal year the Alaskan Branch had completed from aerial photographs planimetric maps covering nearly 5,500,000 square miles and, as part of the same project, topographic maps covering 500,000 square miles.

TOPOGRAPHIC BRANCH

The headquarters offices of the Topographic Branch and its Atlantic Division are located in Washington, D. C.; the headquarters office of the Central Division is in Rolla, Mo.; and that of the Pacific Division is in Sacramento, Calif. Section offices are maintained in Chattanooga, Tenn., and Clarendon, Va.

GENERAL OFFICE WORK

During the year the regular program of cooperative mapping was carried on with 17 States, Puerto Rico, and the Tennessee Valley Authority, but the Topographic Branch directed a large part of its activity to producing maps for the War Department in both domestic and foreign areas. Many field engineers were detailed to this assignment, which included the revision by means of aerial photographs of maps of foreign territory covering approximately 26,000 square miles and the compilation of contour maps from older hachured maps cover-

ing 13,000 square miles. Existing maps for an area of 43,000 square miles were assembled in changed format and re-drafted. A considerable amount of map shading on scales of 1:1,000,000 and larger was done for special use of the Army Air Forces. This work for the War Department is in addition to that reported by the Section of Photomapping.

Section of Computing.—The office processing of control surveys made for the topographic mapping of strategic areas continued in unusual volume during the year. These computations and adjustments resulted in the issue of lithographed lists of leveling, transit traverse, and triangulation results for 70, 186, and 12 quadrangles, respectively. Bulletin 930-D was published during the year, the fourth and last part of spirit leveling in Illinois. Manuscript was prepared in part for a bulletin on spirit leveling in North Carolina. Computations and adjustments for routine field projects were continued, and the usual volume of control data was assembled and transmitted to comply with requests from field engineers and correspondents.

Section of Photomapping.—This section maintains offices in Washington, D. C., Clarendon, Va., Chattanooga, Tenn., Rolla, Mo., and Sacramento, Calif. Its principal work is the production of topographic maps from aerial photographs by stereophotogrammetric methods and the production of planimetric maps and planimetric bases for topographic field surveys by both stereophotogrammetric and graphic methods.

Topographic maps of areas in the United States produced during the year by these methods covered approximately 7,120 square miles; planimetric and base maps covered approximately 13,900 square miles. Topographic maps of foreign areas were produced from aerial photographs for the War Department; of these, maps covering approximately 10,000 square miles were completely processed for reproduction, and maps covering 2,700 square miles were delivered in manuscript form. These figures do not include work performed in the Chattanooga office, which is engaged on a cooperative project with the Tennessee Valley Authority and the War Department.

At the principal office of the section, in Clarendon, Va., in addition to the large production facilities, which are operating on a two-shift basis, there are also maintained a central laboratory for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment utilized for our stereophotogrammetric work and a photographic laboratory specializing on research and precision photography required for the other offices.

The Washington office maintains a general file of aerial photographs utilized in the work of the Geological Survey and of aerial photo-

graphic negatives that have been purchased under photographic contracts. Through this office contacts are maintained with other governmental agencies involved in aerial photographic work.

Section of Cartography.—The Topographic Branch cooperated with the Army Air Forces in preparing aeronautical charts, work on which was performed in the Section of Cartography. Cooperation with the Public Roads Administration was continued, with the result that 31 sheets of road maps were prepared and submitted for reproduction.

Work on the International Map of the World on a scale of 1:1,000,000 was continued. Sheets I-18 (Hatteras), K-10 (Mount Shasta), K-17 (Lake Erie), and L-10 (Cascade Range) were in progress, and Sheet K-16 (Chicago) was in course of publication at the end of the year.

Section of Inspection and Editing.—During the year 224 quadrangle maps were edited for publication, 164 of which were for multicolor photolithography and 60 for engraving; 362 quadrangle maps, 21 State maps, and 4 State index maps were prepared and edited for reprint editions; 206 maps and diagrams that had been prepared as illustrations for geologic reports were edited; and 528 proofs of all kinds were read. On June 30 maps in the process of reproduction included 94 for engraving and 64 for multicolor photolithography; maps being edited or awaiting editing included 35 maps for engraving and 128 for multicolor photolithography; and 664 maps remained on hand for preparation for reprinting.

The Section of Inspection and Editing maintains in Clarendon, Va., a small unit to draft maps produced by the Atlantic Division. Part of this staff was employed for about 5,000 man-days in drafting special maps of foreign areas urgently needed for use in the war program.

MAP INFORMATION OFFICE

The Map Information Office continued its work as clearing agency for data pertaining to maps and aerial photographs of both Federal and commercial agencies. The office maintains extensive card-index and map files and is equipped to furnish data to Federal and State institutions and to the public.

FIELD SURVEYS

Topographic mapping was carried on in 34 States and Puerto Rico. Cooperative projects were conducted with 17 States and Puerto Rico and with the Tennessee Valley Authority. The survey of the islands of Puerto Rico and Vieques was completed.

The mapping of 61 15-minute quadrangles and 192 7½-minute quadrangles was completed, and mapping was in progress on 41 15-minute quadrangles and 49 7½-minute quadrangles at the end of the year. In

addition, work on 128 quadrangles was progressing in some one of the steps prior to actual mapping. Of the 253 quadrangles completed and 90 partly completed, 279 are within the strategic area designated by the War Department. For use in the investigation of strategic and critical minerals, including bauxite, lead, zinc, vanadium, magnesite, high-aluminum clay, coal, and iron ore, 10 special large-scale maps were completed and 4 are in progress. Two maps of special areas on a scale of 1:24,000 were completed for the investigation of coal for coking and transcontinental transportation. Two special areas were mapped for river-utilization purposes and one for flood control. The survey of the Olympic National Park in the State of Washington was continued.

A large amount of work each year consists of the remapping on a larger scale and in greater detail of areas that had previously been mapped and reported, which partly accounts for the small increase in the percentage of the United States covered. Of the total area of the United States, 47.4 percent has now been covered by adequate topographic maps produced by the Geological Survey.

Topographic mapping by the Geological Survey in the United States, Puerto Rico, and Hawaii, to June 30, 1944

State	Area mapped during fiscal year 1944 for publication on standard scales, contour intervals from 5 to 50 feet (square miles)				Total area mapped to June 30, 1944 (square miles)	Percent-age of total area of State mapped to June 30, 1944	Control, fiscal year 1944

WATER RESOURCES BRANCH

Water is one of the Nation's basic assets. It is necessary for all life, for irrigation, navigation, sanitation, and production of power, for certain industrial processes, and for many of the comforts of civilized life. It is a menace to life and property in times of flood. Its deficiency during periods of drought is often calamitous. Water is a varying resource. In all places and times, it is limited in quantity by the amount of water that reaches the earth's surface in the form of rain and snow. The amount available determines the acreage that can be irrigated, the size of power plants, the capacity of industrial plants, and the growth of towns, cities, and communities. In many places the limit of supply available for man's purposes has now been reached; the needs are conflicting, and pressing questions arise relating to priority of rights, superiority of use, and equitable division. Under these conditions reliable information is essential to stability of development, soundness of financing, efficiency of operation, and equity of administration. Congress has authorized the Geological Survey to collect and publish essential facts about the quantity, character, availability, and best methods of utilizing the water resources of the Nation.

COOPERATION WITH STATES AND MUNICIPALITIES

The appropriation by Congress for studies of water during the fiscal year 1944 was \$1,437,700. Of that appropriation, \$1,065,000 was restricted for use in cooperation with States and municipalities, but the 182 cooperating agencies contributed considerably more than that amount, and sufficient additional Federal funds were supplied from the unrestricted part of the appropriation to meet the excess offerings. The amounts contributed by States and municipalities are summarized below:

State:	Contribution	State:	Contribution
Alabama-----	\$14,375	New Hampshire-----	\$9,095
Arizona-----	25,400	New Jersey-----	21,600
Arkansas-----	10,450	New Mexico-----	38,350
California-----	85,913	New York-----	33,549
Colorado-----	33,500	North Carolina-----	24,000
Connecticut-----	10,790	North Dakota-----	7,000
Delaware-----	1,700	Ohio-----	23,067
Florida-----	32,950	Oklahoma-----	20,530
Georgia-----	15,000	Oregon-----	27,040
Idaho-----	26,167	Pennsylvania-----	31,100
Illinois-----	15,113	Rhode Island-----	1,750
Indiana-----	26,178	South Carolina-----	9,700
Iowa-----	25,970	South Dakota-----	2,800
Kansas-----	35,030	Tennessee-----	13,400
Kentucky-----	19,896	Texas-----	66,872
Louisiana-----	31,600	Utah-----	23,167
Maine-----	7,500	Vermont-----	4,760
Maryland-----	17,073	Virginia-----	25,600
Massachusetts-----	15,750	Washington-----	42,980
Michigan-----	18,000	West Virginia-----	9,000
Minnesota-----	16,075	Wisconsin-----	8,263
Mississippi-----	15,000	Wyoming-----	16,575
Missouri-----	13,350	Hawaii-----	44,352
Montana-----	12,660		
Nebraska-----	27,050		
Nevada-----	3,850	Total-----	1,110,890

ACTIVITIES CARRIED ON FOR OTHER FEDERAL AGENCIES

Other Federal agencies provided nearly \$700,000 for water-resources investigations that could not be financed by appropriated funds of the Geological Survey or included in cooperative programs. These agencies are the Office of the Chief of Engineers, Mississippi River Commission, and Office of the Quartermaster General, War Department; Bureau of Yards and Docks, Navy Department; Tennessee Valley Authority; Flood Control Coordinating Committee, Department of Agriculture; Weather Bureau, Department of Commerce; Bureau of Reclamation, Fish and Wildlife Service, National Park Service, Office of Indian Affairs, Office of Land Utilization, and Bonneville

Power Administration, Department of the Interior; Department of State; Defense Plant Corporation; Federal Power Commission; Veterans' Administration; and Federal Works Agency.

WAR AND POST-WAR ACTIVITIES

Requests for special reports on water have continued in large numbers throughout the year. Most of these requests have related to war activities, but increasing numbers of them have related to post-war problems that are now being studied widely. During the year more than 5,000 reports have been made in response to specific requests, 2,263 in the first 6 months and 2,789 in the last 6 months. These are in addition to the regular published reports. They have related to every State and to the Territories of Alaska and Hawaii but particularly to the industrial regions of the East, South, and West.

To record the variations in water supply resulting from fluctuations in precipitation, a widely scattered field force is needed. About 100 field headquarters are maintained, in which the assignments are reasonably permanent and experienced men familiar with local problems related to water are available. Such decentralization also serves well the purpose of cooperation, as close contact is maintained between the Survey personnel and cooperating State and municipal officials, and records and reports are made available currently where urgently needed. During the emergency of war and now in preparing for peace the decentralization has been especially valuable, because men who are experts not only in water but also in local problems have been available in all parts of the country to conduct special field investigations and to furnish promptly and efficiently information not elsewhere obtainable.

The demand for special services related to water as it affects war activities and post-war plans has thrown a heavy burden on the experienced engineers, geologists, and chemists of the Survey at a time when the force has been depleted by enlistment and draft for the armed services and by the assignment of experts to water-supply battalions in the several theaters of war. The maintaining of a force adequate for the performance of work that is essential to both war and peace has been difficult; it has been accomplished only by adding carefully selected replacements to the nucleus of experts.

CONTINUING ACTIVITIES

The operations of the Water Resources Branch are conducted by five administrative divisions—surface water, ground water, quality of water, utilization of water, and power resources. Because of the wide variations in quantity and quality of water, continuity of records is essential both for the emergency problems of war and for the re-

curing problems of peace; it is necessary, therefore, that at least as much of the ordinary activities of the Survey as will suffice to maintain continuity of records shall be carried on, even when the major efforts relate to war problems.

Records of the stage, quantity, or availability of surface waters are collected at about 5,000 gaging stations distributed through every State and the Territory of Hawaii, the number of stations depending upon the funds made available by cooperation with States and municipalities and by transfer from other Federal agencies. The field records are analyzed and released to the cooperating agencies and to the public as promptly as practicable. They are the basis for constructing, operating, and administering municipal and industrial water supplies, irrigation systems, power plants, flood-control works, inland waterways, and similar activities. Cooperation in surface-water studies is effective with about 161 State and municipal agencies, the personnel operating from 63 field offices.

The studies of ground water relate to the waters that lie in the zone of saturation, from which wells and springs are supplied. They cover the source, occurrence, quantity, and head of these waters; their conservation and replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies, and as watering places for livestock, and the methods of constructing and utilizing wells and of improving springs. The increasing use of water from wells is causing a great demand for intensive studies of the quantities of ground water that are perennially available. Investigations conducted from 34 field offices were in progress during the year in nearly every State. In 6 States and in Hawaii the work was done in cooperation with 61 State and municipal agencies. Periodic measurements of water levels or artesian pressure were made in about 7,000 observation wells. Investigations were made or are in progress in most of the critical areas of heavy pumping to determine whether shortages in ground-water supplies are being caused by war demands.

Chemical analyses of 2,563 samples of water were made in the water-resources laboratory in Washington and of 6,729 samples in laboratories in Safford, Ariz., Albuquerque, N. Mex., Raleigh, N. C., and Austin, Tex. Many of the samples were collected in connection with studies of water supplies for Army and Navy establishments and for munitions plants and housing developments. Cooperative studies of the chemical character of surface waters were initiated in Louisiana and North Carolina and were continued in Florida, Georgia, New Mexico, and Texas. Samples of water were analyzed for cooperative studies of ground-water conditions in other States. Interpretations of analyses or advice about water problems were furnished to 16 Bureaus in 6 Federal Departments and to 8 independent agencies.

A variety of hydrologic and hydraulic studies and compilations are made on the utilization and control of streams, and a monthly summary, the Water Resources Review, is issued giving stream-flow and ground-water conditions throughout this country and Canada. These summaries are used extensively by many agencies, including major war agencies, engaged in production where floods or droughts are vital. The administration of certain responsibilities relating to permits and licenses of the Federal Power Commission has been continued. Because of the importance of power in the war program this function is increasingly essential. Investigations of water problems along the international boundary between the United States and Canada have been continued for the State Department and the International Joint Commission. Several studies were made that have an important bearing on water investigations and projects to be undertaken after the war.

CONSERVATION BRANCH

The Conservation Branch has two principal functions: (1) Making surveys of the water and mineral resources of the public domain and applying the results to the problems of public-land administration; (2) supervising operations incident to the development of power and to the production of minerals, including oil, gas, coal, potash, sodium, lead, and zinc from public lands, Indian lands, and naval petroleum reserves.

Additional funds made available during the year provided extra assistance and equipment necessary for the undertaking of field investigations and engineering studies and the preparation of reports dealing with power, fuels, minerals, and chemicals essential to the national war program. The results of this activity, if maintained on the present scale, will reveal the presence of new reserves and will provide information essential to the improvement of production practices and the elimination of waste, thereby increasing available reserves and furnishing the basis for sound post-war planning and true conservation of energy resources.

CLASSIFICATION OF LANDS

Mineral classification.—The Mineral Classification Division, in response to war-engendered demand for new sources of oil, gas, coal, potassium, and magnesium from the public domain, continued and increased markedly all phases of its service of furnishing to the agencies of the Interior Department concerned with public-land administration the geologic findings and decisions required by law or policy.

In all, 10,887 cases, each involving one to many geologic determinations, were acted on during the year, an increase of 38 percent over 1943. In addition, initial or revised definitions of the known geologic structure of four producing oil or gas fields were prepared and promulgated, increasing the net area so defined in 9 public-land States to 1,710,931 acres on June 30, 1944; geologic appraisal was made of 60 unit-plan submissions; and 34 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to Federal lands.

To facilitate the acquisition of the basic geologic data required for the discharge of its increasing duties in connection with public-land classification and leasing-law administration, the Division established during the year regional field offices with a resident geologist in charge of each at Los Angeles, Calif., and Great Falls, Mont., and opened suboffices of its Denver regional office at Casper, Wyo., and Salt Lake City, Utah. From these offices numerous field investigations were carried on during the year in Colorado, Wyoming, Montana, California, and Utah.

Water and power classification.—All new surveys and investigations concerning the water-power resources and storage possibilities of Federal lands were on projects proposed for development to assist in the prosecution of the war or for post-war construction. Topographic surveys were made of 142 linear miles of stream valley and of 1 mineral leasehold, and, in cooperation with the Water Resources Branch, supervision of construction and operation was given to 167 power projects under license from the Federal Power Commission, to 193 such projects under permit and grant from the Department of the Interior, and to 154 in cooperation with the Office of Indian Affairs.

Office studies resulted in the addition of 67,166 acres to power-site reserves and the elimination of 30,650 acres therefrom, with net increase of the outstanding reserves of 23 States and Alaska to 6,671,948 acres; in the publication of maps of 580 miles of river valley and 8 dam sites; in final action involving hydraulic determination on 261 cases received for report from departmental sources and the Federal Power Commission; and in water-power classification on 1,726 cases, which also involved mineral classification. Reservoir-site reserves in 9 States remain unchanged at 137,172 acres.

MINERAL LEASE SUPERVISION

Mine supervision.—The Mining Division supervises operations for the discovery and production of coal, potassium, sodium, phosphate, and oil shale on public lands; of all minerals, except oil and gas, on tribal and restricted allotted Indian lands; and of other minerals on various land grants. The Division serves as consultant to the De-

A variety of hydrologic and hydraulic studies and compilations are made on the utilization and control of streams, and a monthly summary, the Water Resources Review, is issued giving stream-flow and ground-water conditions throughout this country and Canada. These summaries are used extensively by many agencies, including major war agencies, engaged in production where floods or droughts are vital. The administration of certain responsibilities relating to permits and licenses of the Federal Power Commission has been continued. The Conservation Branch has two principal functions: (1) Making surveys of the water and mineral resources of the public domain and applying the results to the problems of public-land administration; (2) supervising operations incident to the development of power and to the production of minerals, including oil, gas, coal, potash, sodium, lead, and zinc from public lands, Indian lands, and naval petroleum reserves.

Additional funds made available during the year provided extra assistance and equipment necessary for the undertaking of field investigations and engineering studies and the preparation of reports dealing with power, fuels, minerals, and chemicals essential to the national war program. The results of this activity, if maintained on the present scale, will reveal the presence of new reserves and will provide information essential to the improvement of production practices and the elimination of waste, thereby increasing available reserves and furnishing the basis for sound post-war planning and true conservation of energy resources.

CLASSIFICATION OF LANDS

Mineral classification.—The Mineral Classification Division, in response to war-engendered demand for new sources of oil, gas, coal, potassium, and magnesium from the public domain, continued and increased markedly all phases of its service of furnishing to the agencies of the Interior Department concerned with public-land administration the geologic findings and decisions required by law or policy.

In all, 10,887 cases, each involving one to many geologic determinations, were acted on during the year, an increase of 38 percent over 1943. In addition, initial or revised definitions of the known geologic structure of four producing oil or gas fields were prepared and promulgated, increasing the net area so defined in 9 public-land States to 1,710,931 acres on June 30, 1944; geologic appraisal was made of 60 unit-plan submissions; and 34 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to Federal lands.

To facilitate the acquisition of the basic geologic data required for the discharge of its increasing duties in connection with public-land classification and leasing-law administration, the Division established during the year regional field offices with a resident geologist in charge of each at Los Angeles, Calif., and Great Falls, Mont., and opened suboffices of its Denver regional office at Casper, Wyo., and Salt Lake City, Utah. From these offices numerous field investigations were carried on during the year in Colorado, Wyoming, Montana, California, and Utah.

Water and power classification.—All new surveys and investigations concerning the water-power resources and storage possibilities of Federal lands were on projects proposed for development to assist in the prosecution of the war or for post-war construction. Topographic surveys were made of 142 linear miles of stream valley and of 1 mineral leasehold, and, in cooperation with the Water Resources Branch, supervision of construction and operation was given to 167 power projects under license from the Federal Power Commission, to 193 such projects under permit and grant from the Department of the Interior, and to 154 in cooperation with the Office of Indian Affairs.

Office studies resulted in the addition of 67,166 acres to power-site reserves and the elimination of 30,650 acres therefrom, with net increase of the outstanding reserves of 23 States and Alaska to 6,671,948 acres; in the publication of maps of 580 miles of river valley and 8 dam sites; in final action involving hydraulic determination on 261 cases received for report from departmental sources and the Federal Power Commission; and in water-power classification on 1,726 cases, which also involved mineral classification. Reservoir-site reserves in 9 States remain unchanged at 137,172 acres.

MINERAL LEASE SUPERVISION

Mine supervision.—The Mining Division supervises operations for the discovery and production of coal, potassium, sodium, phosphate, and oil shale on public lands; of all minerals, except oil and gas, on tribal and restricted allotted Indian lands; and of other minerals on various land grants. The Division serves as consultant to the De-

partment of Agriculture on mining leases under the jurisdiction of that Department and also supervises production of minerals from public lands by the Metals Reserve Co. and the Defense Plant Corporation under authorization of the Secretary of the Interior. The supervisory work, directed from 6 field offices in the western United States and 1 in Alaska, included on June 30, 1944, 636 public-land properties under lease, permit, or license in 15 States and Alaska; 225 Indian properties under lease or permit in 14 States; and 4 secretarial authorizations in 3 States. The total output was valued at more than \$62,000,000.

The Division cooperated with the Departments of War, Justice, and Agriculture, other bureaus of the Department of the Interior, the War Production Board, the Reconstruction Finance Corporation, the Defense Plant Corporation, and the Office of Price Administration by furnishing information on potential sources of minerals necessary to the war program.

The war-induced expansion of mining operations has resulted in an accelerated diminution of the known potash reserves in New Mexico. Under instructions from the Secretary of the Interior the Geological Survey and the Bureau of Mines are cooperatively drilling test holes under contract and have proved additional high-grade potash reserves of national importance in and adjacent to the potash reserve created by Executive Order 6797.

The production of zinc from leased Indian land in Oklahoma has been maintained only by working ores of successively lower grade under the stimulus of production premiums. The Division is now making studies to aid in increasing production by improvements in recovery practices and is obtaining information on the probable reserves of low-grade ore that may be mined by large-scale mechanized operations.

Oil and gas supervision.—The Oil and Gas Leasing Division supervises operations for the discovery and production of petroleum, natural gas, natural gasoline, and butane occurring in public lands of the United States, in naval petroleum reserves, and in all Indian lands subject to departmental jurisdiction, both tribal and allotted, except those of the Osage Nation, in Oklahoma. During the fiscal year 1944 these duties were accomplished through 18 field offices and suboffices in California, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

To meet wartime demands, the Division opened new suboffices at Bakersfield, Calif., and Artesia, N. Mex., and, by intensive recruitment, succeeded in building up four special-study groups to aid in the adoption of proper secondary-recovery methods and other engineering practices necessary to conservation and maximum ultimate recovery of petroleum. During the year studies were completed and preliminary

reports prepared on the Hogshooter Field, Okla., the Cole Creek Field, Wyo., the Grayburg Unit Area, N. Mex., and the Buena Vista Front Pool, Calif.

On public lands 5,329 properties were under supervision at the end of the fiscal year, aggregating 3,106,392 acres in 20 States and Alaska.

Drilling on public lands during the year included the spudding of 536 wells and the completion of 506 wells, 350 of which were productive of oil and gas and 156 of which were barren. In all, 11,096 public-land wells, including 5,893 capable of oil and gas production, were under supervision on June 30, 1944. The production of natural gas and gasoline from public lands during 1944 was somewhat less than in 1943, and the production of crude oil was somewhat more.

The efforts to fulfill the need for new petroleum reserves were reflected in an increase of 8 in the number of new unit plans approved during the year, the total being 18; 29 unit plans were terminated because all rights thereunder were relinquished or abandoned, leaving 112 approved plans covering 1,342,149 acres outstanding on June 30, 1944. Production under approved unit agreements constituted about 59 percent of the petroleum obtained from public lands during the year, 69 percent of the natural gas, and 84 percent of the gasoline and butane.

On Indian lands the work of oil and gas lease supervision involved 4,572 leaseholds in 9 States, containing at the end of the year a total of 7,499 wells, 4,012 of which were productive of oil or gas and 201 of which had been completed during the year. Notable increases in production of natural gas and crude oil were reported from the Chickasaw and Choctaw lands in Oklahoma, from the Blackfeet lands in Montana, and from the Shoshone lands in Wyoming. Rentals, royalties, and bonuses accrued from Indian-land operations during the fiscal year are estimated to aggregate \$3,292,305.

On behalf of the Navy Department supervision was continued over operations for the production of oil, gas, gasoline, and butane from 21 properties under lease in Naval Petroleum Reserve No. 2 in California. Production from 259 active wells on this reserve aggregated 1,569,004 barrels of petroleum, 1,373,863,000 cubic feet of natural gas, and 7,494,253 gallons of natural gasoline and butane, having an aggregate royalty value of \$252,629.

WORK ON PUBLICATIONS

Texts.—The publications in the regular series (professional papers, bulletins, and water-supply papers) issued during the year numbered 49, as contrasted with 76 in the preceding year. This substantial reduction reflects adjustment to a war-curtailed publication schedule, with postponement of more general scientific reports and a concentration on the issue of those that would be of greatest direct or indirect

aid to the war program. In addition, 14 miscellaneous pamphlets were published. Work by the editors included the following: 6,686 pages of manuscript edited and prepared for printing; 223 galley proofs and 3,698 page proofs revised and returned; indexes prepared for 17 publications, covering 1,193 pages and consisting of 1,650 index entries. Copy prepared for mimeographing included 127 press releases, comprising 145 pages, and 257 pages of miscellaneous material.

Illustrations.—Twenty-eight reports, containing 475 illustrations, were transmitted to the printer. In addition, 157 maps and sections illustrating deposits of essential strategic minerals were prepared for preliminary release, and 153 proofs and 67 edition prints were examined.

Geologic map editing.—The work of the Section of Geologic Map Editing was varied in type, ranging from simple line drawing and retouching to extremely difficult drawings of complex maps and sections. In all, 119 maps and other illustrations were prepared. Most of these were concerned with investigations directly related to the war minerals program. A large part of the time of 1 illustrator since March has been spent in the preparation of an index map of the geology of the United States. In addition, maps and other illustrations for 5 water-supply papers and 85 maps for bulletins on strategic minerals and 1 professional paper were edited and reviewed during the various stages of their final preparation.

Distribution.—The Division of Distribution received during the year a total of 804 publications, comprising 63 new books and pamphlets and 2 reprinted books, 293 new or revised topographic and other maps, of which 3 maps were first published as "preliminary" editions, 12 Tennessee Valley Authority maps with contours, 421 reprinted topographic and other maps, 3 new advance sheets, and 10 reprinted advance sheets. The total units of all publications received numbered 88,596 books and pamphlets, 5,000 copies of the revised Missouri index map, and 2,363,815 topographic and other maps, a grand total of 2,457,411. The division distributed, or otherwise disposed of, 287,148 books and pamphlets, 624 geologic folios, and 1,462,298 maps, a grand total of 1,750,070, of which 510 folios and 1,232,123 maps were sold. The net proceeds (gross collections less copying fees and amounts refunded) from the sales of publications were \$31,209.15, including \$31,078.50 for topographic and geologic maps, and \$130.65 for geologic folios. In addition to this \$48,942.53 was repaid by other establishments of the Federal Government at whose request maps or folios were furnished. The total net receipts, therefore, were \$80,151.68.

Engraving and printing.—During the year 84 newly engraved topographic maps, 177 multicolor topographic maps (2 of which were originally printed as advance maps), and 26 special maps were printed, making a total of 287 new maps printed and delivered. Reprint edi-

tions of 403 engraved topographic maps and 22 photolithographed State and other maps were printed and delivered. Of new and re-printed maps, 712 different editions, amounting to 2,359,625 copies, were delivered. A large amount of work was done for 53 other units of the Government, including branches of the Geological Survey, and the charges for it amounted to about \$204,000, for which the appropriation for engraving and printing geologic and topographic maps was reimbursed. Transfer impressions and velox prints, numbering 145, were made during the year, and the amount turned over to miscellaneous receipts was \$263.20. Topographic maps and contract and miscellaneous work of all kinds, totaling 3,096,999 copies were printed and delivered. The photographic laboratory made 12,847 negatives, 27,129 prints, 3,310 photolith press plates, 167 intaglio etchings, 3 celluloid transfers, and mounted 810 prints.

LIBRARY

Work for the Military Geology unit of the Survey constituted a major service of the library. The War and Navy Departments, the War Production Board, the Foreign Economic Administration, and other war agencies made increased use of the library's facilities. The total number of readers was 13,163; of these 3,402 were from other agencies. The total circulation of books, pamphlets, periodicals, and maps was 72,853. Acquisitions were slightly greater than in 1943, but still much below the normal pre-war number. The present war work required a somewhat broader field of material, and this is reflected in the type of books and journals purchased. The Bibliography of North American geology, 1929-39—the 11-year cumulative volume, which includes the otherwise unpublished bibliography for 1937-39—was received from the printer in May. It contains 1,546 pages and more than 28,000 entries. The somewhat new format, which makes it much more useful, has been greatly complimented.

FIELD EQUIPMENT

Outstanding improvements in the trimetrogon mapping procedures are resulting from the construction of three stereoblique plotters by the Division of Field Equipment for the Alaskan Branch during the past year. Numerous operations that had been necessary previously in the production of trimetrogon reconnaissance maps will henceforth be reduced or eliminated, and greater speed, accuracy, and lower costs will result from their use. Parts for seven additional models have been fabricated, and these are expected to be completed and placed in operation during the month of July. Activities during the past year have been marked by the unusual number of "dead lines" that had to be met. One such deadline was the result of a sudden decision to re-design and construct for greater portability an ortho-

graphic projection machine to be taken by military geologists into the theaters of war. This machine is used for producing three-dimensional relief diagrams from topographic maps. It was necessary to complete work on it in approximately one-third of the time needed to produce the original model. Another article that was constructed with very limited time allowance was a graph-rectifying device, by which a discontinuous graph on curvilinear coordinates could be mechanically and accurately translated into a continuous graph with rectilinear coordinates. The device provided an infinite selection of changes in scale, both laterally and longitudinally, to any size within approximately 50 to 150 percent of the scales of the original graphs. Other instruments unusual in type and design that were constructed in the Division of Field Equipment are six Hotchkiss superdips, such as are used by geologists in measuring the comparative magnitude of variations in the earth's magnetic field, and a device which produces true perspective drawings of land areas from topographic maps.

FUNDS

During the fiscal year 1944 there was available for expenditure under the direction of the Geological Survey a total of \$11,585,328. Of this amount \$5,576,495 was appropriated directly to the Geological Survey, and \$6,008,833 was made available by other Federal agencies, and by States and their political subdivisions. In addition, \$9,700 was allotted from the appropriation for contingent expenses of the Department of the Interior for miscellaneous supplies.

Solid Fuels Administration for War

C. J. POTTER, Deputy Administrator

IRREPARABLE harm to the fighting of the war, because of inadequate coal production, was averted during the fiscal year by forthright measures taken by the Solid Fuels Administration for War in cooperation with the coal industry, the mine workers and consumers.

In this period, the Nation's fuel requirements soared to new heights, creating record-breaking demands for bituminous coal, anthracite, and coke.

Lack of manpower and other handicaps, including mine strikes, prevented the coal mining industry from increasing production sufficiently to meet the full requirements of war industries and domestic users and necessitated adoption of a coordinated program to distribute current production to those who needed it most.

Every possible measure was taken to increase production and to distribute mine output so as to avoid distress to domestic consumers and impairment of industrial activity. Early in the period, it was necessary to issue thousands of directions diverting coal shipments to industrial consumers and retail yards in dire need of fuel. Later in the year measures became necessary for general control over distribution of the scarce types of solid fuels.

The Solid Fuels Administration was established 2 months before the start of the fiscal year, succeeding the Office of Solid Fuels Coordinator for War. Within a few days after it was set up, the agency was faced by the coal supply threat which resulted from the first of a series of general mine strikes. These were caused by a breakdown in wage contract negotiations between mine operators and labor. Until the Administration could recruit the trained staff it needed, its skeleton organization was forced to handle the strikes and problems of coal supply chiefly with personnel loaned by other agencies.

Its initial task was that of administering coal mines taken over by the Secretary of the Interior on order of the President but it was relieved of this duty with the establishment of the Coal Mines Administration shortly after the start of this fiscal year. During the period it was administering Government possession, and afterward in cooperation with the Coal Mines Administration to which it was subordinated, it concentrated on the job of increasing mine output.

It worked with the War Manpower Commission and the Selective Service System to retain as much manpower as possible for the mines; with the Office of Price Administration to make sure that coal prices were such as to stimulate the maximum production and distribution; with mine operators, unions, and the Coal Mines Administration to make sure that working conditions in the mines were safe for the miners; with the Office of Defense Transportation to make sure that the supply of coal cars was adequate and that coal was moved expeditiously to the places where it was needed. It cooperated with the operators and the War Production Board to provide essential new and replacement machinery for the mines and with the industry in developing production incentive campaigns. It promoted maximum stocking of coal to keep mines in full operation during the war months. These efforts assisted in stimulating the production of an all-time record volume of bituminous coal and a wartime peak of anthracite output.

Loss of potential coal production during 1943 and 1944 as the result of strikes and discontent among miners cost an estimated 40 million tons of anthracite and bituminous coal. Added to this was a drain on skilled mine manpower into other industries and into the armed services, thereby constantly reducing mine productive capacity. The problem appeared likely to continue throughout the war since replacements are not available.

Upon the men who remained in the mines—and their average age increased from about 32 years to about 45 years—fell the task of stepping up mine output. While these older men did a remarkable job of increasing the per-man production of the mines, they were unable to mine sufficient coal to fill requirements.

As a result, the Nation's needs had to be met in part by utilizing the reserves of bituminous coal above ground in consumers' stockpiles which had been built against such an emergency under the stimulus of the Administration's predecessor, the Office of Solid Fuels Coordinator for War.

From the 86 million tons of bituminous coal in these stockpiles at the start of 1943, a total of some 30 million tons was withdrawn to meet current needs during the calendar year, and an additional 6 million tons was withdrawn in 1944 before consumption fell below production and permitted the addition of fresh reserves to the depleted stockpiles.

The interruptions to production and the fact that the reserves were unequally spread about the country made the problem of distribution

the available coal supply extremely complicated. Coal distribution, even in peacetime, is a complex job. Grades, types, and sizes of coal vary widely, and consumers' burning equipment likewise varies. Some consumers cannot operate without certain coals; other consumers, because of long use and tradition, are accustomed to particular coals. With the shortages of manpower affecting mines unequally, radical shifts had to be made in the distribution of the output of mines throughout the country to make sure that consumers requiring special coals were able to get them and that consumers got enough of some kind, grade or size of coal for essential needs.

This was a task of enormous magnitude. It meant taking into account the production of about 15,000 mines controlled by 14,000 producers; it meant utilizing efficiently the distributing facilities of 1,500 wholesalers and of tens of thousands of retail dealers; it meant considering the needs of millions of domestic and industrial consumers.

Before the coordinated program necessary properly to balance all the factors entering into this complex situation could be fully developed and effectuated, one local crisis after another had to be surmounted. While much of the Solid Fuels Administration's effort had to be devoted to handling immediate and specific problems, nevertheless, prior to the close of 1943, it was possible to inaugurate broader-gage plans and by the spring of 1944 the entire distribution program had been put on a long-range basis.

THE IMMEDIATE PROBLEMS

The first serious coal shortage occurred in the byproduct coke industry, which supplies the steel industry, as a result of decreased output in mines normally serving it, coupled with increased requirements. This was met by emergency directions which diverted coal suitable for byproduct purposes from other industries to the byproduct plants. The second immediate problem was to halt a maldistribution of anthracite among domestic consumers resulting from changes in the pattern of requirements and from deficiencies in the productivity of various mines. The third problem was to increase the flow of coal via the Great Lakes to move a year's supply to upper lake docks before the seasonal close of navigation. The fourth problem was to supply coal to industries with insufficient stockpiles.

After the start of the heating season and throughout the winter months there was superimposed upon these principal problems a whole series of domestic coal shortages throughout the eastern half of the country. Community after community ran short of coal and required emergency assistance. Bituminous coal normally used by industry was rushed into Northeastern States to supplement inadequate supplies of domestic-sized anthracite. Similarly, bituminous coal was diverted into Southeastern States and into Michigan for domestic purposes.

Throughout the Plains States voluntary emergency shipments of coal were moved into hundreds of communities. Part of this domestic crisis was due to a shortage of coal to meet unexpectedly increased requirements which came from a decline in the firewood supply, from conversions to coal by users of oil and gas and from war-created population shifts.

These sweeping problems compelled the Solid Fuels Administration to increase its small initial staff rapidly by drafting trained coal men from other Government bureaus and from the industry.

LONG-RANGE PROGRAMS

Handling of the earlier problems was largely by specific directions to producers to ship coal to consumers who were short. These actions prevented interruptions of the war-production program and general suffering among domestic consumers of coal. As the volume of these directions became unmanageable, it became necessary to issue broad orders to direct the whole flow of coal and thereby eliminate many specific directions.

As rapidly as conditions permitted, the Solid Fuels Administration began to make plans for coal distribution in the months ahead. The first long-range plans covered the winter of 1943-44 and a second series of plans covered the entire coal year of 1944-45. By April 1, 1944, general regulations had been issued laying down a distribution program to continue in effect until March 31, 1945. This program, covering the whole distribution of solid fuels, is designed to spread the supplies expected to be available as fairly as possible. Cut-backs in the domestic consumption of the scarcer solid fuels are provided to assure that most domestic consumers may receive up to nine-tenths of their normal requirements of coal.

To draw up these programs it was necessary to collect a large volume of production and distribution statistics. A steady flow of this information to the Solid Fuels Administration was thereafter required. Upon the basis of these reports it was possible to keep reasonably informed on over-all coal supply and distribution and to determine changes necessary in the pattern of coal distribution.

To assemble this information, full use was made of the statistical services of the former Bituminous Coal Division and of the Bureau of Mines. But with the termination of the Bituminous Coal Division in August 1943 a large share of this statistical work fell upon the Solid Fuels Administration itself. Before the end of the fiscal year, all this work was turned over to the Bureau of Mines in the interest of the most efficient coordination.

In developing its new programs, the Solid Fuels Administration relied in large measure on the experience and advice of the coal industry. A series of industry committees provided continued close contact of the agency with producers, transporters and distributors of coal.

The primary committee is the Solid Fuels Advisory War Council, first set up early in 1942 by the Solid Fuels Coordinator for War. Its counsel has been secured on every important program undertaken by the Solid Fuels Administration. Contacts with soft coal producers are maintained through advisory boards for the 22 bituminous coal mining districts.

Advisory committees have been established by the Solid Fuels Administration to cover the supply and distribution of anthracite, of bituminous coal and of coke for domestic use. To maintain contact with the thousands of retail dealers, a National Retail Distribution Committee meets regularly to make recommendations.

Dealers throughout the country have been organized into committees to function as an emergency distribution system prepared to avert the development of acute shortages by keeping the Solid Fuels Administration currently informed on area supply conditions. The same committees will function, when necessary, to pool dealer and community resources and take other steps to meet unavoidable emergencies. This flexible system is adaptable to varied local conditions.

ANTHRACITE DISTRIBUTION

Anthracite, the primary fuel for household and other domestic uses in New England and the Middle Atlantic States, provided the Solid Fuels Administration with the most difficult retail distribution problems met in 1943-44. Responsible for this were the sharply increased demands for domestic sizes due to the influx of war workers into eastern cities, to heavy seaboard conversions from fuel oil, gas and fuel wood, to the withdrawal of much coke from the domestic market, to heavy consumption in the winter of 1942-43 which had exhausted normal dealer inventories and to large new requirements for the military services.

Partly due to these changes in demand and partly to changes in the productivity of various mining operations, a serious maldistribution of the available hard coal was far advanced before the Solid Fuels Administration could halt it. Some retail dealers had received large supplies of anthracite and had oversupplied their customers and others had received little or no coal and their customers were undersupplied.

An emergency program to halt this maldistribution was instituted by the Solid Fuels Administration shortly after mid-June 1943. This program was enlarged on September 1 by ordering a redistribution of current production among wholesalers as a means of bringing retail dealer receipts nearer a common level and by cutting back 10 percent under the 1942-43 receipts the quantities individual dealers could receive. At the same time, the Office of Price Administration was given authority to limit the distribution of hard coal from retailer

to consumer. In November 1943, the Office of Price Administration relinquished this control and the Solid Fuels Administration itself instituted a dealer-consumer limitation program.

While these measures improved the situation, the earlier maldistribution could not be fully corrected and, as the winter progressed, hundreds of householders in community after community ran out of coal simultaneously. Emergency diversions totaling some 300,000 tons of coal were required during the winter months to relieve distress. Moreover more than 825,000 tons of hard coal were ordered transferred from one wholesaler to another to level the coal year distribution. To supplement inadequate anthracite supplies, coal from Northern and Southern Appalachian bituminous mines was diverted into seaboard communities. Emergency organizations of several types helped to distribute the limited supplies of solid fuels to householders who ran short in many of these communities.

The supply of anthracite available for domestic distribution in the 1944-45 coal year is running more than 6,000,000 tons short of estimated requirements. A similar shortage existed in the 1943-44 coal year.

A new control program, developed from the 1943-44 coal year experience and designed to spread equitably the limited production, was instituted on April 1, 1944, for the 1944-45 coal year. This limits domestic consumers to seven-eighths of their normal supply and provides better controls over distribution from the mines to assure that the output is distributed fairly among dealers.

Increased output of fine sizes of anthracite, suitable only for industrial use, threatened for a time in the fiscal year to clog up the anthracite car supply by the inability of producers to market the coal. However, the Solid Fuels Administration undertook a program to find additional uses for these fine sizes and the situation had been helped before the year's end.

BITUMINOUS COAL DISTRIBUTION

Approximately 90 percent of the Nation's coal output is bituminous coal which varies widely in type and quality depending on the mine and the area from which it comes. Since it is the chief industrial fuel, as well as the domestic fuel for millions of consumers, supply deficiencies could interfere seriously with the whole war program.

Shortages in the supply of high grade eastern-mined coals, which are required for coke making in the expanding steel industry and for the production of metals and certain strategic chemicals, created difficulties early in the fiscal year. As time went on, these shortages extended into the domestic supply which, in large areas, was threatened. Consumers, both industrial and domestic, who were unable to secure the eastern coals then turned to midwestern coals and these new and

heavy demands extended the shortages into those fields. Consumption requirements exceeding the output were met by diversions from industrial users who had stockpile protection.

Diversions of current production were accomplished, first, by specific directions which ordered coal shipped to a consumer who was short, and, second, by the institution of regulations which restricted the amount of coal industries were permitted to procure currently in accordance with the protection represented by their stockpiles. The first method, which continued to be necessary in some instances even after general regulations were instituted, necessitated learning from whom the coal would be taken and making sure that it was the type which was suitable for the consumer to whom it was directed. Under the second method of general regulation, industries with ample stockpile protection were compelled to reduce current purchases proportionately, and industrial users with little or no coal on hand were permitted to buy beyond current requirements to build up their protection.

The volume of specific directions issued at times during the fiscal year laid a heavy burden upon the staff of the Solid Fuels Administration. In all a total of 6,541 directions for the shipment of bituminous coal were sent out covering a total of 10,417,496 tons.

Because production of many captive mines which supplied coal to the byproduct coke industry had declined seriously, the problem of supplying the proper coal for coke manufacture was one of the first handled by the office. To reduce the flow of directions diverting coal suitable for byproduct and special purposes away from industrial consumers who had been using it for steam generation, producers were required eventually to give a first preference, before filling any other orders, to the needs of the byproduct industry and to users of special purpose coals.

Late opening of the 1943 navigation season on the Great Lakes and the mine strikes which interfered with the normal movement of coal to the lakes had held the movement up the lakes before midsummer to a dangerously low point. To force additional coal up the lakes, producers were directed to fill orders for coal to be moved by lake, second only to the top preference given to byproduct and special purpose coal. Extremely heavy shipments followed during the last few months of the navigation season, with the result that by the end of 1943 the total movement from Lake Erie ports was within 2,000,000 tons of the 1942 shipments. The preference for lake-borne coal was continued in the 1944-45 program with the additional requirement that shipments be made on an equal monthly basis throughout the navigation season, thereby eliminating need for heavy late season movements.

Although the Pacific Northwest had been expected to provide serious problems in the winter of 1943-44 and the Solid Fuels Administration took steps to prepare for them, a combination of circumstances

favorable to the area carried it through the winter without special trouble. Production of coal mines in the Pacific Northwest grew better, the volume of coal imported from Canada was increased and, unexpectedly, a large flow of coal was available from mines in Colorado and Utah. This coal normally would have been moved to the Plains States, but a blocked railroad tunnel necessitated its movement elsewhere.

Although the winter was mild in the Northwest, in the Southeast it was 15 percent colder than normal. The Southeastern States are dependent normally on the same Southern Appalachian mines which supply the Great Lakes trade. Insufficient production in the mines coupled with the heavy movements to the lakes decreased the coal available for the Southeast.

To correct this situation between January and March 1944, producers normally supplying the Southeast were required to fill all outstanding retail orders from that area on their books. Approximately 400,000 tons of coal were moved into Southeastern States in two weeks and the situation was relieved.

The heavy requirements for Southern Appalachian coal for by-product purposes and for the Great Lakes movement likewise brought repercussions in other areas, such as Michigan, where domestic consumers ran short of the coal they normally received all-rail from the mines. Shipments direct from mines either by voluntary arrangement with the producers or by specific direction assisted in relieving these shortages. Communities in Western Kentucky, Western Tennessee and other East South Central areas normally receiving high volatile coals from midwestern mines also suffered periods of shortage due to the heavy demand for those coals. Emergency shipments from the mines relieved the deficiencies.

The supply of bituminous coal for the Nation's railroads, which ordinarily consume 23 percent of the bituminous coal output, ran perilously low several times during the winter. Emergency action was required to keep some of the biggest lines in full operation. After consultation with the railroad industry, arrangements were made to substitute available coal for some of the high grade eastern coal the railroads ordinarily used. This has resulted in a largely increased use by railroads, even in the East, of middle western and strip-mined coal. Railroads normally supplied with eastern coal from the Great Lakes docks are now taking midwestern coal moved by way of Lake Michigan.

With the end of the heating season in the spring of 1944, the Solid Fuels Administration controls over the distribution of bituminous coals were relaxed as far as practicable to encourage industrial consumers to rebuild their depleted stockpiles as rapidly as coal became available, thereby fully utilizing mine capacity. The modifications

were first applied to midwestern coals and then were extended to various eastern coals as the heavy demands for those coals declined. No modifications, however, were made in the controls over Southern Appalachian-mined coal which remained in short supply.

Since it was evident that the available tonnage of domestic sizes of Southern Appalachian coals would continue below requirements, a new Governmental control was put into effect on April 1, 1944, limiting the amount of such fuels dealers could furnish to domestic consumers during the warm months for storage purposes. Under this regulation, which was of temporary character, an equitable distribution of the limited supply expected to be available during the spring and summer months was instituted. A program to supplant this temporary action and to control the distribution of scarce bituminous coals throughout the 1944-45 coal year was being formulated at the end of the fiscal year.

DOMESTIC COKE DISTRIBUTION

The responsibility for the equitable distribution of domestic coke was delegated by the War Production Board to the Solid Fuels Administration on December 31, 1943. Temporary regulations were instituted for the remainder of the winter providing that coke be supplied only to consumers with limited stocks. In the 1944-45 coal year program the distribution of domestic coke was coordinated with that of other domestic solid fuels. In the New England and Middle Atlantic States coke is controlled under the regulations which govern anthracite. In the remainder of the country it is controlled under the regulations which govern the distribution of scarce bituminous coal.

To increase the supply of fuel available for the Northeastern and Middle Atlantic States, producers were persuaded to reclaim usable beehive coke which had accumulated in refuse piles near the ovens. This coke has helped materially in supplementing the supply of fuel available to domestic consumers, but the supply is running short and is expected to become exhausted within the next few months.

Because some of the reclaimed coke was being marketed without proper preparation, the Solid Fuels Administration established a maximum permissible limit for ash content to insure that unsatisfactory fuel was kept off the market.

COAL PRODUCTION

Definite contributions to the coal industry's remarkable production record in 1943 and in the first half of 1944 were made by the Government's coal agencies, the Solid Fuels Administration for War and the Coal Mines Administration. Output in 1943 was estimated at 589,000,000 tons of bituminous, an increase of some 6,000,000 tons over

1942 and the highest production on record, and at 60,644,000 tons of anthracite, highest since 1930. This was accomplished in spite of the continuous attrition of mine manpower and the losses of potential production during the strikes.

The two Government agencies helped to bring harmony between management and labor, helped to make 6-day operation general throughout the industry and secure cooperation of the industry in reducing production losses at holiday and vacation times. The Coal Mines Administration, through the Government-labor agreement, lengthened the working day. The Solid Fuels Administration for War took every available step to maintain mine manpower, to provide essential machinery and equipment and to assist in the extension and development of the mines.

Much of the increased production has been in the low grade and strip-mined bituminous coals and in the fine sizes of anthracite, all of which are suitable only for some industrial purposes. Production of the eastern-mined bituminous coals, essential to the byproduct and metallurgical industries and for domestic use, and of domestic sizes of anthracite continue far short of requirements. Careful control of the distribution of these scarce coals, both hard and soft, is required to assure that the consumers who must have them receive at least enough for their minimum needs.

THE COAL OUTLOOK

Programs of the Solid Fuels Administration for War designed to promote equitable distribution and assure the coal supply for essential users during the next fiscal year should prevent much of the maldistribution which would otherwise be caused by production deficiencies in particular anthracite and bituminous coals. Moreover, an extensive system of field offices, coupled with the work of industry committees, should provide a rapid check on coal supply conditions and permit action to be taken in time to avert the development of emergency conditions.

Also, in the event that unavoidable emergencies arise, the machinery is now functioning to divert coal rapidly to meet the immediate needs of industrial and domestic consumers.

Under present conditions, the individual industrial and domestic consumer will get the greatest coal protection by cooperating with his supplier to:

1. Store as much of his equitable share of coal as his supplier can furnish before the start of the next heating season.
2. Substitute available and suitable alternative coals, as far as possible, for the use of the scarce fuels.
3. Exercise the utmost conservation in the use of the fuel that he is able to obtain.

Coal Mines Administration

C. J. POTTER, Deputy Administrator

THE NATION'S coal mining industry, of which possession was taken by the Government when it was paralyzed by a general strike, was back in private control before the end of the fiscal year, with harmony restored between management and labor and with production at a wartime peak.

Affairs of the Coal Mines Administration, set up by the Secretary of the Interior to administer Government possession of the mines, were being liquidated as the fiscal year ended.

All but 2 of the mines had been turned back to their owners 13 months after possession of some 3,300 strike-bound pits was taken by the Government to restore and maintain full coal production essential to the successful prosecution of the war.

During the period of Government possession :

A strike-bound, demoralized industry was restored to full operation without bloodshed or use of force, despite the almost hopelessly tangled relations between the mine workers and the operators.

Working time was substantially increased and the miners redoubled efforts to get out the coal under a Government wage contract which provided for no increase in the basic rates of pay specified by their pre-war contract with the operators.

All previous bituminous coal production records were broken and anthracite was at wartime maximum in an industry that for years has failed to operate in the absence of a contract between its owners and employees.

Mine workers and operators were finally brought together on a mutually acceptable wage contract within the National Stabilization Program, and the mines were quickly restored to private possession and control.

The Secretary of the Interior first took possession of the coal mines on May 1, 1943, under an Executive order of the President after general strikes had practically halted mining operations and curtailment of war production was being threatened by coal shortages. The strikes resulted from a break-down in wage contract renewal negotiations between the operators and mine labor.

The initial take-over was carried out by the Solid Fuels Administration for War. However, that agency had been established primarily to regulate wartime coal distribution and early in July 1943, the Secretary set up the Coal Mines Administration to administer Federal possession of the coal pits.

After the first take-over, the miners voluntarily returned to work under arrangements made by the Secretary for operation under Government control. On June 25, 1943, the War Labor Disputes Act (Smith-Connally Act) became law, requiring a return of Government-possessed private properties to their owners within 60 days after they had attained the productive efficiency prevailing prior to the take-over. Under the terms of this law, and under the existing circumstances the mines were all returned to their owners by October 12, 1943, although no wage contracts for their operation had been concluded.

Sporadic strikes again broke out a day later, the miners refusing to stay on the job in the absence of a wage contract.

By November 1, strikes had become widespread and production had practically ceased. A new Presidential Executive order was then issued authorizing and directing the Secretary of the Interior once again to take possession of all mines in which production had been stopped or was threatened by strikes. The new order directed the Secretary to " * * * offer the duly constituted representatives of the workers' own choosing a contract or contracts governing the terms and conditions of employment for the period of the operation of the mines by the Government * * *."

The Secretary immediately called in representatives of the United Mine Workers of America and on November 3, after but a few hours of actual negotiation between representatives of the workers and of the Coal Mines Administration, reached an agreement as to the terms and conditions of employment to govern both bituminous and anthracite mines in the Government's custody.

This agreement continued in effect various changes in the former contracts which had been ordered by the War Labor Board and further, provided for an increase in the workday and for payment in the bituminous mines for portal-to-portal travel time in accordance with principles formally announced by the War Labor Board.

This contract was subsequently approved by the War Labor Board as being within the Stabilization Program.

Under the new Government-United Mine Workers agreement, so far as bituminous coal was concerned, assuming that 45 minutes were spent daily by the miners in travel inside the mine between the mine mouth and the working face, the miners agreed to work 8 hours a day at actual coal production instead of the 7 hours spent under the previous industry agreement. This new agreement later became the basis for a new contract between the operators and mine labor.

Under the agreement, payment of a basic wage of \$8.50 per day in the bituminous mines was authorized. This was the amount the miners would have earned for 8 hours of actual work under the old contract. Of this sum, 50 cents was counted as basic compensation for portal-to-portal travel time.

The contract provided no increase in the basic wage rate of \$1 per hour for straight time and \$1.50 per hour for overtime but it recognized that the bituminous miners were entitled to pay for inside travel time as well as worktime.

Under the new contract, the basic wage obtainable by inside day men in bituminous mines was \$57.06 per week for the new 8-hour work-day as contrasted to an average of \$45.50 per week for the 7-hour day under the old contract. The change required the men to stay underground 9 hours per day, which includes an average of 8 hours productive work, 45 minutes of travel time and 15 minutes for lunch, to earn \$8.50 per day.

The agreement between the Government and the United Mine Workers of America similarly provided for increased work by the anthracite miners. Under this agreement hard-coal miners contracted to reduce their customary 30-minute lunch period to 15 minutes. The 15 minutes given thereby became productive time for which compensation would be paid at the rate of 37.8 cents per day for each miner—the average overtime rate for that time on the job under the old industry contract.

In mid-November the Secretary of the Interior called together 29 of the principal owners and operators of bituminous coal and anthracite mining properties and urged them to negotiate a contract with the mine workers, pointing out that the execution of a firm contract was essential to settlement of the Nation's coal troubles. Two days later he convened a joint conference of the bituminous coal operators and representatives of the United Mine Workers to start them on the resumption of negotiations to work out a joint wage agreement within the framework of the November 3 Government agreement and the decisions of the National War Labor Board.

As a result of the deliberations of this group, an industry agreement was worked out to continue in effect until March 31, 1945. The agree-

ment was modeled on the Government contract and provided for a retroactive payment of \$40 in settlement of portal-to-portal travel time claims. At the request of the negotiators, the Secretary called a meeting in Washington on December 17, 1943, at which representatives of approximately two-thirds of the Nation's bituminous coal tonnage approved the new Supplemental Wage Agreement. The agreement was then submitted to the War Labor Board.

In the spring of 1944 widespread unrest developed among soft coal miners as a result of failure to execute the agreement and delay in making the \$40 retroactive payment. On May 19, 1944, the Supplemental Wage Agreement was approved by the War Labor Board and the Director of Economic Stabilization. The approval covered the entire agreement including the \$40 retroactive pay provision.

In the anthracite industry negotiations between operators and the miners eventuated on March 8, 1944, in a contract to remain in effect until April 30, 1945. The contract continued the provisions of the Government agreement as well as the other modifications which had been directed previously by the War Labor Board and compromised several controversies which had not yet been settled. It received War Labor Board approval on April 7. This contract was finally ratified by the mine workers after a tri-district convention in mid-June.

The Secretary of the Interior terminated Government possession of mines operated by the members of the Coal Producers Association of Illinois on December 20, 1943, after a contract had been executed with the Progressive Mine Workers Union labor in those mines. Possession of other mines was retained by the Coal Mines Administration after the receipt of an opinion of the Attorney General to the effect that the War Labor Disputes Act did not require that possession of mines be terminated if the absence of a firm wage contract constituted a continued threat to the maintenance of coal production.

On May 31, 1944, the Secretary terminated Government possession of bituminous coal company properties in six production districts which had executed the bituminous wage contract and had indicated their readiness to put it into effect immediately upon termination of Government possession. Between May 31 and June 21, mines of additional companies were released as information was received that they had either executed or were about to execute the wage contract and were ready to put it into effect.

On June 21, the Secretary released the mines of all coal companies, both anthracite and bituminous, then remaining in Government possession, except two. These were the bituminous mines of the Jewell Ridge Coal Corporation of Tazewell, Va., which was testing the va-

lidity of portal-to-portal payments in Federal courts. They were still in Government possession at the end of the fiscal year.

Administration of Government possession of the mines in 1943-44 was carried out with practically no interference with the normal management of the mining properties, and the coal mining operations continued to be for the financial account of the coal mining companies.

Executive heads of the various coal companies were designated as Federal operating managers of the mines and field staffs of Government trained men were established in the production districts to maintain contact between the Coal Mines Administration and the operating managers. The staff of the Coal Mines Administration itself was kept at minimum size by utilizing as far as possible the services of trained men already serving the Department of the Interior in the Solid Fuels Administration, the Bureau of Mines and the Bituminous Coal Division until that division was terminated in August 1943.

Mine output increased impressively during the period of Government possession in spite of steady manpower drains, the serious production losses in the strikes and sharp increases in the average age of miners. For 1943 as a whole, bituminous production totaled 589,000,000 tons, the highest output on record. Anthracite output totaled 60,644,000 tons, the highest production in 14 years. In the first half of 1944, soft-coal production increased 12 percent and anthracite 13 percent over the first 6 months of 1943.

Besides the longer working day provided under the Government-mine workers' agreement, several programs sponsored by the Government undoubtedly contributed to this achievement. Most important of these was the 6-day-week program. Shortly after the Government takeover, instructions were issued to all operating managers to afford the men an opportunity to work the sixth day. This resulted in more general 6-day operation than had been the case previously.

The miners were afforded an opportunity to work during the usual holiday and vacation periods. As a result, very substantial tonnages of coal were produced on various days in 1943 and 1944 ordinarily observed as holidays in the mines. Production was also maintained during the scheduled vacation period of 1943 and operators and miners in 1944 made supplementary agreements to eliminate the vacation period.

A Sunday work program was instituted in the anthracite mines in February 1944, by agreement with the operators and miners. In the four Sundays of that month, nearly 600,000 tons of hard coal were added to the Nation's supply. At the same time, the month's output on the usual working days was raised 100,000 tons over that in January.

While the mines were in Government possession, Coal Mines Administration officials worked continuously to settle and prevent the day-to-day strikes which ordinarily occur in individual mines as a result of local disputes. Other programs included an investigation of the operation of company-owned commissaries and an intensification of health and safety activities. Fewer lives were lost per million tons of coal mined between November 1, 1943, and May 30, 1944, than in any comparable period on record.

Petroleum Conservation Division

J. W. STEELE, Acting Director

THROUGH foresight of Congress the Connally "Hot Oil" Act was enacted February 22, 1935, delegating to the President prescribed powers "to regulate interstate and foreign commerce in petroleum and its products by prohibiting the shipment in such commerce of petroleum and its products produced in violation of State law, and for other purposes." Primarily designed "to encourage the conservation of deposits of crude oil within the United States" the Petroleum Conservation Division was created to effectuate the expressed intention of Congress.

Acting through the Secretary, as the designated agent of the President, the functions of Petroleum Conservation Division are to assist in the prescribed administration of the act, to cooperate with oil and gas producing states in the prevention of waste and the adoption of uniform oil and gas conservation laws, and to keep informed as to the movement in interstate commerce of petroleum and its products with respect to its parity between supply and consumptive demand.

Regulations were promulgated requiring, among other things, the keeping of books and records and the filing of reports by those respectively engaged in producing, shipping or transporting, and refining petroleum within designated areas.

FEDERAL PETROLEUM BOARD

Federal Tender Board No. 1 was established at Kilgore, Tex., to enforce the Connally Act by administration of regulations promulgated thereunder and to regulate the movement in interstate commerce of petroleum from designated areas. This Board, under supervision of the Petroleum Conservation Division, continued its prescribed func-

tions until October 27, 1942, when it was superseded by the present Federal Petroleum Board in pursuance of Order No. 1753-A.

While the Connally Act is applicable to any State having conservation laws regulating production of petroleum, regulatory operations of Federal Petroleum Board are now confined to 106 counties in Texas, the 2 principal oil producing counties in New Mexico, and the entire State of Louisiana. The major oil producing and refining sections in the Southwest are within these areas. Eliminating fields of minor commercial significance, there are 557 oil fields, containing 64,584 oil wells, producing daily an average of 1,914,500 barrels of crude oil; 79 refineries processing daily an average of 1,446,000 barrels of petroleum products; and 128 gasoline plants producing daily an average of 105,500 barrels of casinghead gasoline and liquefied petroleum gases.

The counties within Texas and New Mexico which were excluded from the designated areas contain fields incapable of producing oil in excess of the amounts permitted by State laws and are therefore not subject to prohibitions prescribed by the Connally Act. The administration of prescribed regulations would, in such fields, be an unwarrantable burden on the industry and an unnecessary expense to the Government. For similar reason, the required filing of reports by producers has been suspended in certain fields within the designated areas.

The enforcement of the act and administration of the regulations is essentially a specialized field operation requiring, among other things, physical inspection of properties and facilities of oil operators. This function is necessary to maintain effective control over the interstate movement of petroleum and petroleum products. As a result of this control, illegal practices are reduced and a maximum compliance with conservation laws is maintained in oil operations.

Extensive activities of Federal Petroleum Board have been somewhat curtailed by reduction in experienced personnel and other wartime handicaps, yet the volume of criminal investigative operations has been maintained at a comparatively high level.

During the fiscal year 41 criminal investigations were initiated which, together with 4 investigations in progress at the close of the preceding year, were disposed of as follows:

One case was successfully prosecuted; 27 were concluded administratively because of insufficient and inconclusive evidence; and 2 were closed by action of the Attorney General. At the close of the year, 2 cases were pending with the Department of Justice, 3 were pending trial on dockets of United States District Courts, 1 case was in process of transmittal to the Department of Justice for prosecution, and 5 cases remained under investigation.

At the beginning of the year eight criminal cases were pending with the Department of Justice. Two cases were successfully prosecuted, five were closed because of inconclusive evidence, and one was pending June 30, 1944.

Of seven criminal cases pending in Federal courts at the beginning of the year, six were successfully prosecuted and one remained pending trial on June 30, 1944.

In the nine cases successfully prosecuted fines aggregating \$7,430 were assessed and several suspended sentences were imposed.

General Land Office

FRED W. JOHNSON, Commissioner

NEW LEGISLATION to modernize present Federal land laws is one of the requirements essential to the most effectual use of the millions of acres of public land in the continental United States and Alaska under the jurisdiction of the General Land Office. Only through the enactment of such remedial statutes can the maximum benefits under national conservation safeguards be assured with which to meet current and post-war demands for the utilization of natural resources. Moreover, this fundamental need, firmly established by land administration experience in connection with the war, is an integral factor in the adequate handling of the after-the-war responsibilities of this Federal organization which for 132 years has served as the official real estate agent of the Government.

The needs for up-to-date laws are numerous and are reflected in virtually every field of public land administration. Specifically, however, there are at least five major points at which service to the public is being hampered by lack of adequate statutory authority to act. These are outlined in the following:

RECOMMENDATIONS

1. Mechanized warfare has shown beyond a doubt that minerals are the sinews of modern war and unequivocally demonstrated the necessity for the highest degree of efficacy in our national mineral economy. That goal is not possible of attainment without a rejuvenation of our Federal mining laws. The experience of the first few months of the emergency when our admittedly superior technical and industrial skill was handicapped by a lack of readily available raw mineral materials, must not be repeated. The gravity of the situation is aggravated by the fact that generally speaking, the United States had the materials at all times, but because of antiquated statutes, was unable to find out what and where they were.

Specifically, the vast areas of public lands and lands acquired under the National Industry Recovery Act, the Bankhead-Jones Farm Tenant Act and various relief appropriation and rehabilitation acts constitute a veritable storehouse of essential minerals. Under present statutes, no method exists by which the United States may catalog and in cooperation with private initiative develop the resources on those acquired lands through leases based on sound principles of conservation. Such legislation as will enable the marshalling of our full complement of mineral resources is a necessary adjunct to adequate stock piling not only for current needs but also for future post-war or emergency demands. Moreover, the application of the leasing system to the acquired lands would be particularly advantageous, since it would allow those lands, which are in large part situated in or near well-settled areas, to be used contemporaneously for mining and for numerous essential surface uses.

Similarly, except for the fuel and fertilizer minerals in the public lands, no authority at present exists for supervising the mining of other minerals owned by the United States. No real mineral conservation is possible without such authority. A general leasing system would supply not only the power to conserve but would enable the Government to classify and catalog its mineral resources on these lands also. Finally, the accumulation of knowledge of the allocation of mineral deposits which would naturally result from a leasing system, would prove a valuable defense element in time of war.

2. One of the elements essential to successful administration of the public domain is complete, authentic information as to the character and status of the land. At the present time, evidence of the filing of thousands of unpatented mining claims is not made a matter of Federal record, but is merely registered in county recording offices. The enactment of legislation to enable the recording of such evidence in the General Land Office is urgently recommended. The decided advantage of such a system was clearly demonstrated during the earlier stages of the war when time-consuming search of county offices had to be made before land could be made available for troop-training and other military purposes.

3. One of the most serious handicaps to proper administration of the public domain during the post-war period is expected to be the lack of any facilities by which detailed information can be secured concerning the real-estate holdings of the various branches of the Federal Government. The establishment within the General Land Office of a centralized, consolidated inventory of all such land records is recommended as a solution of this problem.

4. Plans for land settlement in Alaska call for the utmost in service and safeguards for the public if development of the Territory is to be attained on a permanently stabilized basis. Protection against ill-

advised use of the public domain in Alaska, similar to that afforded on the mainland through the requirements for classification of land tracts for the best use to which they may be put, would do much to promote the stability of its economic future. The passage of legislation making such classification statutes applicable to the public domain in the Territory is urgently recommended.

5. The need for the utmost development of natural resources consistent with nonwasteful use is apparent from even the most cursory survey of post-war requirements. The world-wide pressure for forest products resources, food, fiber, or leather furnished in part from the public domain will call for the highest possible efficiency in the administration of the public lands. Greater protection of the public lands and their resources from dissipation would be afforded by the enactment of a uniform Federal trespass law.

POST-WAR PLANNING

Besides the necessity for modern laws, an adequate response to the prospective heavy demands for natural-resource materials in the rehabilitation of a post-war world entails a need for coordinated planning after the war. Such a program encompassing many aspects of settlement, resource development and other problems in land administration already has been set under way by the General Land Office. The scope of this work is indicated below.

ALASKA

Popular interest in the Territory of Alaska has reached new heights. The presence of American troops, the construction of the military highway system, and the influx of civilian workers on the many construction projects in Alaska have focused attention upon the possibilities of the area for permanent homes. In advance of anticipated post-war demands, trained technicians were sent to the Territory by the General Land Office near the end of the fiscal year, in order that plans could be ready for an orderly development of land-settlement activities which will safely avoid the disastrous ghost-town experiences of earlier settler days on the mainland. Meantime, deluged with requests for information, the Office distributed tens of thousands of leaflets and other publications setting forth the basic requirements for land settlement in the Territory under Federal law. The principal point stressed in all this material is the fact that, contrary to popular belief, it is not possible to secure public land on an "order by mail, sight unseen" basis, since Federal statutes require personal inspection and full knowledge of the general characteristics of any piece of land for which application may be made.

Coupled with the land settlement problem is the need for the identification through official surveys executed by the Cadastral Engineering

Specifically, the vast areas of public lands and lands acquired under the National Industry Recovery Act, the Bankhead-Jones Farm Tenant Act and various relief appropriation and rehabilitation acts constitute a veritable storehouse of essential minerals. Under present statutes, no method exists by which the United States may catalog and in cooperation with private initiative develop the resources on those acquired lands through leases based on sound principles of conservation. Such legislation as will enable the marshalling of our full complement of mineral resources is a necessary adjunct to adequate stockpiling not only for current needs but also for future post-war or emergency demands. Moreover, the application of the leasing system to the acquired lands would be particularly advantageous, since it would allow those lands, which are in large part situated in or near well-settled areas, to be used contemporaneously for mining and for numerous essential surface uses.

Similarly, except for the fuel and fertilizer minerals in the public lands, no authority at present exists for supervising the mining of other minerals owned by the United States. No real mineral conservation is possible without such authority. A general leasing system would supply not only the power to conserve but would enable the Government to classify and catalog its mineral resources on these lands also. Finally, the accumulation of knowledge of the allocation of mineral deposits which would naturally result from a leasing system, would prove a valuable defense element in time of war.

2. One of the elements essential to successful administration of the public domain is complete, authentic information as to the character and status of the land. Finally, the accumulation of knowledge of the allocation of mineral deposits which would naturally result from a leasing system, would prove a valuable defense element in time of war.

2. One of the elements essential to successful administration of the public domain is complete, authentic information as to the character and status of the land. At the present time, evidence of the filing of thousands of unpatented mining claims is not made a matter of Federal record, but is merely registered in county recording offices. The enactment of legislation to enable the recording of such evidence in the General Land Office is urgently recommended. The decided advantage of such a system was clearly demonstrated during the earlier stages of the war when time-consuming search of county offices had to be made before land could be made available for troop-training and other military purposes.

3. One of the most serious handicaps to proper administration of the public domain during the post-war period is expected to be the lack of any facilities by which detailed information can be secured concerning the real-estate holdings of the various branches of the Federal Government. The establishment within the General Land Office of a centralized, consolidated inventory of all such land records is recommended as a solution of this problem.

4. Plans for land settlement in Alaska call for the utmost in service and safeguards for the public if development of the Territory is to be attained on a permanently stabilized basis. Protection against ill-

advised use of the public domain in Alaska, similar to that afforded on the mainland through the requirements for classification of land tracts for the best use to which they may be put, would do much to promote the stability of its economic future. The passage of legislation making such classification statutes applicable to the public domain in the Territory is urgently recommended.

5. The need for the utmost development of natural resources consistent with nonwasteful use is apparent from even the most cursory survey of post-war requirements. The world-wide pressure for forest products resources, food, fiber, or leather furnished in part from the public domain will call for the highest possible efficiency in the administration of the public lands. Greater protection of the public lands and their resources from dissipation would be afforded by the enactment of a uniform Federal trespass law.

POST-WAR PLANNING

Besides the necessity for modern laws, an adequate response to the prospective heavy demands for natural-resource materials in the rehabilitation of a post-war world entails a need for coordinated planning after the war. Such a program encompassing many aspects of settlement, resource development and other problems in land administration already has been set under way by the General Land Office. The scope of this work is indicated below.

ALASKA

Popular interest in the Territory of Alaska has reached new heights. The presence of American troops, the construction of the military highway system, and the influx of civilian workers on the many construction projects in Alaska have focused attention upon the possibilities of the area for permanent homes. In advance of anticipated post-war demands, trained technicians were sent to the Territory by the General Land Office near the end of the fiscal year, in order that plans could be ready for an orderly development of land-settlement activities which will safely avoid the disastrous ghost-town experiences of earlier settler days on the mainland. Meantime, deluged with requests for information, the Office distributed tens of thousands of leaflets and other publications setting forth the basic requirements for land settlement in the Territory under Federal law. The principal point stressed in all this material is the fact that, contrary to popular belief, it is not possible to secure public land on an "order by mail, sight unseen" basis, since Federal statutes require personal inspection and full knowledge of the general characteristics of any piece of land for which application may be made.

Coupled with the land settlement problem is the need for the identification through official surveys executed by the Cadastral Engineering

Service of additional tracts of the public land in the Territory. Some idea of the task confronting the General Land Office in this respect may be gained from the fact that only 2,322,079 acres of the total land area of 365,481,600 acres have as yet been surveyed. While, of course, all of the remaining 363,159,521 acres of unsurveyed land will not be included in even the most extensive post-war plans, since it contains mountainous terrain and other tracts not adaptable to use, nevertheless the cadastral measurement of land areas as a step toward proper settlement activities will be a necessary part of the post-war program.

The resumption of tourist travel in Alaska and the growth in the population expected to result from the increased settlement after the war will involve greater responsibilities for forest fire protection than those now borne by the Alaskan Fire Control Service. This branch of the General Land Office, which has just completed its fifth year of operation can, upon the cessation of the war emergency, be expanded to meet the urgent needs of post-war conditions in the Territory.

SOLDIER SETTLEMENT

American service men and women have become more land-conscious than any group of comparable numerical strength in recent years. Trained in camps far from their homes, and later transferred to foreign lands, they have acquired a yearning for a home of their own, which in many instances means a homestead on Government land. The furnishing of an adequate number of land areas to meet that demand is another high priority problem facing the General Land Office in the postwar era. Its solution is complicated by the fact that homesteading, as popularly understood, was first set under way by President Abraham Lincoln 82 years ago and that, as a consequence, good farm land upon which an agricultural living can be made as required by the homestead law, is scarce on the vacant, unappropriated and unreserved public domain in the United States which still remains in Federal ownership. This does not apply to the public land in Alaska, where good agricultural areas still are open to settlement, nor, obviously, to such farm lands as may be made available on Federal reclamation projects.

Meanwhile, another and broader opportunity for land settlement by World War veterans as well as civilians is afforded under the terms of a law which authorizes the lease or sale of not to exceed 5 acres of public land for home, camp, cabin, health, convalescent, recreational, or business purposes. Popularly known as the "small sites" act, this law does not require the making of a living by agriculture upon the land. In order properly to care for the postwar expansion in this type of land settlement, field parties of the General Land Office were engaged during the past year in the classification of areas of the public domain suitable for such use, and informational material setting

forth the location of the tracts and the legal requirements for their settlement was made available to the public.

The gratitude of the Nation for its fighting forces has always been reflected, after other wars, in the granting of special privileges to veterans in the acquisition of the public land. Credit for military service, for example, was given in meeting the time requirements involved in securing land under the homestead laws. The extension of similar credit to veterans of this war is authorized in legislation advocated by the General Land Office which had passed the House of Representatives, but not the Senate, by the end of the fiscal year. Its final approval will prove another favorable factor in soldier settlement plans in the postwar period.¹

TRAINING AREAS

A segment of the public domain equal to half the total land surface in New York State has been directly dedicated to war purposes. Some set aside for national defense use even before Pearl Harbor brought a formal declaration of war, these 15,400,000 acres withdrawn by public-land orders or Executive orders swiftly were transformed into troop training areas, target ranges, tank maneuver grounds, aerial bombing ranges, and other forms of military reservations. All of these lands were mustered into active service only for the duration of the war, with the stipulation that the tracts would return to their "civilian" status in the public domain 6 months after Presidential proclamation that the emergency is at an end.

The fitting of these "demobilized" lands into the post-war economy will constitute another element in General Land Office activities. Some of the tracts, formerly so isolated as to be of minor use, now are made more accessible by the construction of military roads and other improvements. Whether tracts of such a type will present additional opportunities for small site or other form of settlement after the war is a major angle to the postwar land administration problem.

NATURAL RESOURCES

A broader responsibility in the conservation of natural resources on the public domain forms still another factor in General Land Office operational plans for the period after the war. Widening the scope of these activities, Congress during the past fiscal year passed a law extending the policy of sustained yield timber management to all the public land. The application to the entire public domain of this principle which has been so successful in the development and pro-

¹ This act (Public 434) was approved by the President on September 27, 1944. It gives credit up to 2 years for military service in meeting residence and cultivation requirements under the homestead laws, and grants veterans during the next 10 years a 90-day preference right of application under the homestead or desert land laws, and the small site leasing act.

duction of forest products on 2,500,000 acres of revested Oregon and California railroad grant lands, is calculated to prove a distinct contribution in the solution of postwar economic problems.

The resumption on an enlarged scale of operations by the Range Development Service, curtailed during the emergency, will be an integral part of plans for securing the maximum benefits from the use of natural resources on the public domain in the production of food after the war. This program of conservation carried on in cooperation with livestock men who use the public range outside Federal grazing districts for feeding and watering their cattle or sheep will provide technical assistance in combatting soil erosion, the construction and improvement of watering facilities, and the fencing and reseedling of grazing areas.

The part that the public lands may play in the expansion of air-borne transportation facilities after the war already is a matter of study by the General Land Office. Under existing Federal statutes, it is the responsibility of the office to lease portions of the public domain for use as airfields by municipalities or private individuals; consideration currently is being given to the problem of whether amendment of the laws might not be advisable to permit the leasing of public lands for landing fields and repair shops in glider operations as well as airplane flights.

THE YEAR IN REVIEW

With many of its field offices reporting an upswing in "over the counter" business similar to that which prevailed in the General Land Office as a whole, a review of activities for the fiscal period ending June 30, 1944, reveals an outstanding record of accomplishment under national conservation policies.

RECEIPTS AND EXPENDITURES

Not the least of the year's achievements was the financial benefit accruing to the American taxpayer from the General Land Office operations. Total receipts for the 1944 fiscal year were \$14,355,342, the highest since 1924, and more than \$4,597,000 greater than the previous fiscal period. This was the third time since 1880 that receipts of the General Land Office have exceeded \$14,000,000.

Total operating expenses of \$2,321,664 were only \$17,000 more than the previous year, with the result that the ratio of receipts to expenditures in 1944 was \$6.18 in income for every \$1 of outgo, the highest ratio in a decade and nearly double that attained in 5 of the last 10 years.

MINERAL WORK BREAKS RECORDS

All records for the largest amount of money ever offered to the United States Government for the privilege of drilling for oil on one

acre of Federal land were shattered twice in the same year by the General Land Office in leasing the public land for development of petroleum resources during the 1944 fiscal period. Oddly enough, both record-breaking bids were offered for land in the same area—the Elk Basin oil and gas-producing field in Wyoming. In August 1943 a bid of \$5,800 smashed all previous high offers for 1-acre drilling rights. Three months later, a bid of \$26,216.21—nearly five times greater than the previous high mark—was made to set a new world's record for peak value per acre of Government oil land. This unprecedented price was offered for land in the Elk Basin field which comprised one of seven parcels in the area which aggregated approximately 75 acres.

Nearly 3 million dollars was paid the Government during the year as bonus bids for the privilege of drilling for oil, a profit to the taxpayer which does not take into account the additional rental and royalties from production on the lands which accrue to the Federal Government under General Land Office lease operations. Federal lands in Wyoming made the largest contribution in bonus-bid revenues, the lease of 2,849.05 acres bringing a bonus of \$2,844,028.46. The lease of lands in Montana, New Mexico, Oklahoma, Utah, and Wyoming brought a combined bonus bid score for the year of \$2,874,454.

The net result of these and other financial transactions conducted by the General Land Office in the mineral field during the year was the collection of receipts totaling \$11,791,097. This constituted the second highest cash proceeds from mineral activities to the Government during the 24 years of operations under the Mineral Leasing Act of 1920, the peak of \$13,631,840 having been reached in 1924.

Bringing about a 25 percent increase in the amount of coal produced from the public lands during the year, the General Land Office contributed 9,061,045 short tons of fuel to keep war factories in operation in 1944. During the same period, a 10-percent increase was attained in the amount of petroleum produced from the public domain, 15 percent in potassium salts, and 18 percent in sodium salts.

Besides these direct contributions from the public domain, more than 70,800,000 acres were withdrawn for various war uses in connection with the development of strategic minerals, and 43,000 acres were provided under special licenses to defense plants for the extraction of strategic minerals.

BEST LAND USE STUDIED

Complex problems ranging from determining the status and disposal of 11 million acres of land ceded to the United States 75 years ago by the Ute Indians of Colorado to the designation of tracts suitable for settlement by returned war veterans placed heavy burdens upon the technical branches of the General Land Office during the 1944 fiscal year. Serving as the channel for authentic information and

statistical data upon which governmental procedures and Federal legislation may be based, the Research and Analysis Division completed its Federal land inventory covering four Western States and registered notable progress in the compilations affecting other areas of the public domain. Carried out with the assistance of the Civilian Public Service Camp in Elkton, Oreg., the inventory makes available for the first time in public land administration activities a complete set of county maps encompassing Nevada, New Mexico, Utah, and Wyoming, and showing the location of the public-land tracts and the several agencies of Government which exercise jurisdiction over the areas as of 1941.

Coequal with the task during 1944 of assembling and interpreting data on the scope, location and character of the public lands was the responsibility of the Land Classification Division in protecting the areas from unwise or wasteful use. A prerequisite to the disposal of any portion of the public domain under national conservation policies written into the Taylor Grazing Act of 1934, land classification involves the scientific determination of the best use to which the land may be put, and the approval or rejection of land use applications on the basis of these findings. One of the outstanding accomplishments of the Division during the year was the classification in advance of applications for use of areas of the public lands suitable for lease by ex-soldiers and others for home, camp, health, convalescent, recreational, or business purposes. In this way, opportunity has been afforded for speedy action on this feature of post-war land settlement problems.

OREGON AND CALIFORNIA REVESTED LANDS ADMINISTRATION

The furnishing of forest products for war and the taking of definite steps toward permanent economic stability of the lumbering industry and communities in the post-war period was the twofold task accomplished by the Oregon and California Revested Lands Administration during the 1944 fiscal year. This branch of the General Land Office was established in 1938 to carry out provisions of Federal law which require sustained-yield forestry management practices on 2,500,000 acres of land formerly included in a grant for construction of a railroad between Oregon and California, but now reverted into Federal ownership. Under the sustained-yield method of forestry management, timber-cutting is limited to the extent which will insure a continuous supply of raw materials for the industry and communities dependent upon it for existence. Replenishment of the forests is fostered through tree planting, reseeding of denuded areas, fire protection and other forest conservation practices.

Containing one of the finest stands of Douglas Fir trees in the United States, the Oregon and California lands have been called upon for valuable contributions to the Nation's war needs, furnishing forestry products ranging from heavy construction and bridge timbers to airplane woods. In the past year, sales of timber from these lands exceeded 390,063,000 board feet, valued at \$1,361,991. More than \$900,000 of the proceeds from these sales are scheduled to be paid to the 18 counties in Oregon in which the lands are situated, in accordance with Federal statutes.

Plans to activate the program for setting up operating units in the Oregon and California land structure laid aside on account of the war emergency, were carried forward during 1944. Under this program, the economic selfsufficiency of the lumbering industry and communities in the region will be sought through the establishment of a marketing area to be served by the unit through a continuous flow of forest products insured under sustained-yield timber cutting.

Further augmenting the post-war program for betterments in the industry on the Pacific coast is the planting of seedlings on the denuded land by the Oregon and California organization. Utilizing the services of Civilian Public Service Camp enrollees, a total of 1,650,000 young trees were planted during 1944. Many of these seedlings were grown in nurseries maintained by the General Land Office.

CADASTRAL ENGINEERING SERVICE

Scientific land measurements which have been basic in the administration of the public domain since the earliest days of the Republic were carried on by the Cadastral Engineering Service in 1944 as an essential part of the conduct of the war. Differing from the type of survey work which involves primarily the recording of geologic, geographic, or historic features of the terrain, cadastral surveying consists of careful measurement of areas on the ground, for use in connection with administration of the public lands, and the recording of such measurements by the placing of monuments or other markers, and the preparation of maps scientifically compiled from field notes made by trained engineers at the time of the on-the-ground measurements.

Although sharply curtailed by wartime restrictions upon funds, personnel, and materials, these survey activities nevertheless were maintained in 17 States and Alaska during the year. Centering its operations primarily upon projects directly connected with the war, the Service, through 86 field groups and facilities maintained in 13 public survey offices, responded to requests for technical assistance from the Army and Navy and 6 other agencies of the Government, in addition to the work-schedule of the General Land Office.

As a result of these operations, more than 1,352,800 acres of land were surveyed or resurveyed during the course of the year, embracing projects essential to the war-connected livestock industry, timber resources, and power sites for war and post-war purposes. Meantime, approximately 44 million acres of land await survey by the Service as the result of approved projects. Study of these projects with a view to their inclusion in an expanded survey program to be undertaken with the return of normal peace-time conditions, formed a part of the workload in the last fiscal year.

BRANCH OF FIELD EXAMINATION

One of the primary agencies of Government in bringing about the best use of the public lands in the interest of conservation and the public welfare is the Branch of Field Examination. Its activities during 1944 ranged from finding new pastures for ranchers engaged in raising livestock for the war to the subterranean tracing of deprecations which 42 years ago resulted in the unlawful mining and removal of more than 200,000 tons of coal from the public domain.

Particularly important to the war are the operations of this organization in the investigation of mining claims on sites selected for military purposes. As a result of these examinations, undertaken at the request of either the War or Navy Department, many thousands of abandoned claims have been eliminated with a saving of thousands of dollars in the acquisition of the lands. In one region alone, it was discovered that, out of several thousand mining locations examined, only three were maintained in accordance with existing law, and these three were appraised and purchased by the War Department.

The examination of land upon which is based the rejection or approval of plans for its use under the public land laws, is a major responsibility of the Branch. Similar investigatory work in connection with tracts of the public domain outside Federal grazing districts which are sought for livestock raising, was another task confronting the field examiners in 1944. In the course of these latter operations, some isolated areas overlooked by the ranchers and aggregating more than 150,000 acres were brought to the attention of the livestock men and made available for lease in order that the war food supply might be increased.

With its staff of trained technicians including mining and civil engineers, geologists, lawyers, auditors, timber cruisers, range specialists, and others experienced in land investigations, the Branch during the year handled many difficult and unusual types of cases. In the field of trespass upon the public lands there was, for instance, the case where trees had been lifted bodily and planted miles away, for landscape purposes, and, in the case of the pilfered coal, the BFE men had to dig their own mine shafts and face the dangers of fire damp

to determine the extent of the damage inflicted upon the public domain resources nearly a half-century ago.

ALASKAN FIRE CONTROL SERVICE

The Alaskan Fire Control Service completed its fifth year of activity on the public domain in Alaska in 1944 with a record of the lowest fire losses yet sustained during its operations in the Territory. However, despite cooperation between the various Federal agencies and the military forces in Alaska, coupled with unusually favorable weather conditions from the standpoint of fire protection, the Service nevertheless was called upon to suppress 61 fires which burned 53,686 acres during the year. Handicapped by restricted funds and personnel, it was powerless to undertake suppression work on 13 fires in other areas which consumed more than 180,000 acres.

From the military point of view, much valuable assistance was given in the prosecution of the war by the activities of the Service in the last 12 months. Numerous fires endangering military installations, encampments, equipment, etc. were suppressed by the personnel and equipment of this General Land Office agency. In addition, radio stations and other air navigational facilities were several times saved from destruction or impairment, while the air-lanes were kept unusually free of smoke, thus partially removing one of the annual hazards formerly confronting all air transportation in interior Alaska.

One of the world's largest single fire-fighting districts, the responsibilities of the Alaskan Fire Control Service embrace more than 250 million acres of public domain, including approximately 40 million acres of forests, 110 million acres of open woodland and grassland and 100 million acres of sometimes dry and inflammable tundra areas.

GRAZING ON PUBLIC LANDS

More acres of public land outside Federal grazing districts than ever before were utilized under lease from the General Land Office in 1944 for the production of food, fiber, and leather for military and civilian needs. Registering an increase of more than 400,000 acres over the previous year, a total of 12,440,210 acres of public land in continental United States and Alaska were made subject to use under 10,020 separate leases involving annual rentals of \$227,308.

In addition to the activities for augmenting the Nation's supply of livestock products afforded by the leasing of the public lands for grazing, the operations of the Range Development Service form an integral part of the progressive permanent land administration program under the supervision of the General Land Office. Although its activities were restricted by wartime personnel and material shortages, this Service nevertheless worked on 134 projects designed to improve

stock raising conditions on more than 800,000 acres. Equipped to carry forward a broad program of range improvement; its work includes the development of watering facilities, replenishment of forage through reseeding and control of soil erosion. Working in close co-operation with the stockmen who contribute a portion of the labor and funds necessary to undertake the projects, the Service is prepared to put into effect a broad schedule of improvements when normal employment and supply conditions are restored.

THE PUBLIC LANDS

AREA OF THE PUBLIC LANDS

The area of public lands remaining in Federal ownership, including Indian trust and tribal lands, as of June 30, 1944, amounted to about 400 million acres in the public land States, and about 365 million acres in Alaska. Approximately 393 million acres of these public lands were vacant and unreserved as follows: 37 million acres in the States outside of Federal grazing districts; 131 million acres within such districts; and 225 million acres in Alaska.

Of the approximately 778 million acres remaining in Federal ownership in the States and Alaska, 118 million acres in the States and 363 million acres in Alaska were still unsurveyed as of June 30, 1944.

The total acreage patented with minerals reserved to the United States was increased during the year to 48,688,421 acres, as shown by the following table:

Acreage of lands patented with minerals reserved to the United States, as of June 30, 1944

Type of mineral reservation	Patented during fiscal year 1944	Total patented through June 1944
Reservation of all minerals:		
Under Stock Raising Act.....	38,803	33,570,958
Under other acts.....	116,303	2,325,572
Total.....	155,106	35,896,530
Reservation of specific minerals:		
Coal.....	15,948	10,870,531
Others ¹	11,649	1,921,360
Total.....	27,597	12,791,891
Grand total.....	182,703	48,688,421

¹ Includes coal reserved in combination with other minerals.

LEASES AND PERMITS

During the year an additional area of 594,366 acres was brought under lease, including mineral licenses and permits, making a total of 15,913,927 acres under lease at the end of the year. The types of leases in force June 30, 1944, are shown by the following tables:

Mineral leases, permits, and licenses outstanding,¹ as of June 30, 1944

Mineral	Leases		Permits		Licenses		Total	
	Number	Acres	Number	Acres	Number	Acres	Number	Acres

Others.....	3	153.01	10.00
Total.....	10,731	12,627,427.41	252,076.21

¹ Does not include rental of 1 lease, the rental of which is based on receipts.² Sale price of timber authorized to be cut.³ Does not include rental of 4 business site leases, the rentals of which are based on receipts.

In addition, 634,800 acres were being used at the end of the year by Federal and local agencies, private individuals, and corporations under permit by the Commissioner of the General Land Office. War agencies held temporary Departmental permits for the use of about 22 million acres of public lands.

HOMESTEADS, SALES, AND OTHER ENTRIES

A decline in the number of entries on the public lands in continental United States was experienced during the year, the number of new homesteads decreasing from 213 during the fiscal year of 1943 to 158 during 1944. The number of new homesteads in Alaska, however, increased from 79 to 94.

The following tables show the new entries and selections allowed, the entries finally approved, and the patents and certificates issued during the year. At the end of the year 4,302 entries embracing 663,796 acres were pending awaiting further compliance with the public land laws by entrymen or final action by the General Land Office.

Original entries and selections¹ fiscal year 1944

¹ Where upon final examination it is found that an entry or selection is in proper form and that the law has been complied with, a patent conveying the legal title to the claimant is issued. In the case of certain State selections, the legal title is conveyed upon approval thereof by the Secretary of the Interior and certification by the Commissioner of the General Land Office.

² Isolated tracts.

³ Indian tribal lands.

⁴ Acreage not counted because previously reported.

LAND GRANTS

Title to 102,185 acres was conveyed during the year in satisfaction of grants of land made to the States and railroads by the Congress for public purposes. Grants to States included 75,180 acres of park selections, 17,426 acres of indemnity school land selections, 2,662 acres selected for miners' hospitals, and 1,740 acres of swamp land. The Northern Pacific Railroad received 5,177 acres patented to it pursuant to the Transportation Act of 1940. In addition to these grants, 25 patents were issued to States to give them additional evidence of title to 569,575 acres of previously granted school sections.

A total of 249 applications for rights-of-way were approved during the year under laws which provide for the granting of rights-of-way over the public lands for telegraph and telephone lines, public roads,

pipelines and other purposes. Of the applications approved, 81 involved permits or easements calling for an annual rental of \$2,520 and 33 were temporary rights-of-way over the Oregon and California lands with an annual rental of \$340.

LAND EXCHANGES

Exchanges of land with private parties and local governments during the year resulted in the addition of 144,904 acres to grazing districts in exchange for 153,314 acres of Federal land; 13,553 acres to Indian reservations in exchange for 18,063 acres; 2,219 acres to the Oregon and California lands in exchange for 840 acres; and 361,778 acres to national forests in exchange for 23,381 acres of land and sufficient timber to equalize the values involved.

RECEIPTS AND EXPENDITURES

Receipts from all sources during the year totaled \$14,355,342. Mineral rentals, royalties, and bonuses accounted for 82 percent of the total receipts and sales of timber from the Oregon and California and Coos Bay lands for an additional 13 percent. The remaining 5 percent was realized from fees and commissions, sales of public and ceded Indian lands, rentals, fines and penalties, copying fees, and from miscellaneous sources.

Of the total receipts, 37 percent will be distributed to various States and counties and 43 percent will be credited to the reclamation fund. Except for \$13,098, which will be credited to Indian trust funds, and \$50,617 which will be credited to the range improvement fund, the remainder will be covered into the general fund of the Treasury.

Expenditures from appropriations amounted to \$2,321,664 distributed as follows: general, \$857,495; surveys, \$560,766; field examination, \$331,461; administration of the revested and reconveyed lands, \$257,966; district land offices, \$250,727; range improvements, \$32,986; and fire control in Alaska, \$30,263. Expenditures, aggregating \$286,374, were made from funds transferred to the General Land Office for the emergency protection of certain public lands and for soil and moisture conservation operations.

The following table shows the receipts earned during the year, by sources and by Treasury accounts.

Disposition of receipts of the General Land Office,¹ fiscal year 1944

Source of receipts	Covered in the Treasury earmarked for—				
	General fund	Reclamation fund	States and counties	Indian trust funds	Total
Sales of public lands.....	\$25,095.57	² \$90,000.00	³ \$2,000.00	-----	\$107,095.57
Fees and commissions.....	10,264.76	² 40,000.00	-----	-----	50,264.76
Mineral leases and permits:					
Mineral Leasing Act.....	1,091,397.48	5,729,836.78	4,092,740.56	-----	10,913,974.82
Red River oil and gas lands.....	-----	-----	3,582.93	\$5,971.54	9,554.47
Potash.....	58,788.08	² 358,754.91	220,455.30	-----	637,998.29
Other.....	⁴ 229,570.31	-----	-----	-----	229,570.31
Total mineral.....	1,379,755.87	6,088,591.69	4,316,778.79	5,971.54	11,791,097.89
Oregon and California grant lands..	885,112.83	-----	885,112.82	-----	1,770,225.65
Coos Bay grant lands.....	4,969.21	-----	² 20,000.00	-----	24,969.21
Taylor Act grazing leases.....	50,616.58	⁵ 50,616.58	101,233.17	-----	202,466.33
Rights-of-way leases.....	30,408.75	-----	-----	-----	30,408.75
Sales of reclamation town lots.....	-----	⁶ 13,608.65	-----	-----	13,608.65
Sales and lease of Indian lands.....	-----	-----	-----	7,126.23	7,126.23
Copying fees.....	17,343.36	-----	-----	-----	17,343.36
Miscellaneous.....	340,735.33	-----	-----	-----	340,735.33
Grand total.....	2,744,302.26	6,272,816.92	5,325,124.78	13,097.77	14,355,341.73

¹ Before final settlement of all accounts by the General Accounting Office.² Estimated.³ Includes \$50,117.50 collected in California under act of Oct. 2, 1917 (40 Stat. 297).⁴ Includes \$20,257.66 collected in Wyoming under act of June 26, 1926 (44 Stat. 1621), \$193,195.80 collected in California under Executive order 9087 dated Mar. 5, 1942, and \$16,116.85 collected in Alaska, of which \$260 were collected under the Mineral Leasing Act of 1920.⁵ Range improvement fund.⁶ Includes \$1,250 from sales of reserved reclamation lands.

Office of Land Utilization

LEE MUCK, Assistant to the Secretary

THE activities of the Office of Land Utilization are primarily of an advisory and coordinating nature. The assumption of administrative functions that should be performed by the bureaus and other units which form a part of the departmental organization are assiduously avoided. The office aids in every possible way in the formulation of plans for the improvement of administrative activities and takes the lead in the presentation to the Congress of the appropriation needs of the Department as a whole for soil and moisture conservation operations, white pine blister rust control, and emergency forest fire protection.

When such appropriations are authorized, they are allotted to the various action agencies of the Department in proportion to requirements as revealed by detailed reports. In such apportionment the office utilizes the experience gained by members of its force during many years of practical administration in responsible units of the Federal Government over widely distributed areas. The details of expenditure and the field supervision of construction, protection, and related activities are left primarily to the discretion of representatives of various administrative units. Supervision by the Office of Land Utilization is confined to the guidance of the action agencies in the selection of projects which can unquestionably qualify as appropriate activities under the justifications that have been submitted to the Bureau of the Budget and the Congress and upon the basis of which it is assumed the appropriations were made. The supervision of appropriations and coordination of types of projects to be undertaken is supplemented by field inspections and conferences with those in direct charge of field activities for the purpose of insuring that the final results achieved are consistent with the general purposes of the Department.

In the soil and moisture conservation program emphasis is constantly placed upon the restoration to former productiveness of range

lands and farm lands that have been subjected to improper use and it is insistently required that proper use be established as a condition precedent to the expenditure of Federal funds in a restoration plan. Attention is centered upon the proposition that only when the recovery of a range and the restoration of agricultural productivity can not be effected through the utilization of natural processes should expensive methods of control be used. The recuperative powers of nature are astonishingly effective in the correction of unfavorable conditions when the destructive agencies are removed. The artificial reseeded of a range may secure no better result than carefully regulated grazing will effect at a much lower cost. The construction of expensive masonry structures for the protection or restoration of eroding farm lands is authorized only when it is reasonably apparent that less heroic measures will not be effective.

In the problem of protecting forests from fire, disease, and insects there is generally less occasion for cautioning against precipitate expenditures than there is for encouraging alertness. The suddenness with which a forest fire may develop into an uncontrollable conflagration and the insidious manner in which a forest disease or insect infestation may spread before detection demand constant vigilance and prompt suppression without too anxious a calculation of the initial cost. The Office of Land Utilization need offer no apologies for its persistent advocacy of increased measures of forest protection, especially for the vast resources of Alaska which have never received the protection which their economic importance justifies.

SOIL AND MOISTURE CONSERVATION OPERATIONS

Under the provisions of the Soil Conservation Act of April 27, 1935 (49 Stat. 163), and the President's Reorganization Plan No. IV (54 Stat. 1234), soil and moisture conservation projects on lands under the jurisdiction of the Department of the Interior are coordinated through the Office of Land Utilization.

The impact of the war had a restraining effect on the scope and amount of work undertaken and, accordingly, the soil and moisture conservation program of the Department has been restricted to avoid conflicts in the use of labor, equipment, or materials that might be needed in the prosecution of the war. The practices and procedures followed have been adjusted to a wartime economy, with the emphasis on those projects and operations which would contribute to the winning of the war. Special emphasis has been placed on projects such as range reseeded, small water developments, water spreading, vegetative gully control, and similar projects that are low in cost, that can largely be accomplished through the use of local materials, and that fit in with the cooperation obtained from the users of the land.

Much of the soil erosion and water losses from the lands under the jurisdiction of the Department was occasioned by unsatisfactory use conditions on the upper portions of the various watersheds. These conditions were the result of ill-advised use or misuse over a long period of time. Continued use of these lands was necessary in the war program and the procedures adopted gave consideration to the necessity of maintaining use while correction of the unsatisfactory conditions was occurring. Accordingly, a major part of the effort of the Office of Land Utilization in the coordination of the program for the Department as a whole was to secure a maximum amount of cooperation from the users of lands under its supervision. This procedure was devised to develop interest in conservation by the users of the Federal lands and to accomplish a larger amount of work by obtaining contributions of labor, materials, and money. During the past year these contributions in value amounted to 50 percent of the amount appropriated by the Congress.

Close cooperation also was maintained by field offices of the land-management agencies with local soil conservation districts, pursuant to an interdepartmental cooperative agreement between the Department of Agriculture and the Department of the Interior, which recognized that the conservation of soil and moisture on Department of the Interior lands was a segment of the over-all national conservation policy.

The funds available during the past year, namely \$1,333,200 were less than at any time since the program started, but much progress was made in soil and moisture conservation by reason of the high degree of cooperation which prevailed.

The Department now is well organized for the prosecution of a sound program of soil and moisture conservation that is understood and supported by the land-management agencies and by a constantly increasing number of the users of its lands. With the continuation of the necessary funds for the work during the post-war years, marked progress can be made in the restoration and rehabilitation of those lands under the jurisdiction of the Department which now are in an impoverished condition. The program as a whole has been designed and procedures have been set up to effect a complete and coordinated rehabilitation program on a sound, practical basis.

COORDINATION OF WATER PROGRAMS

In recognition of the fact that programs designed to attain a closely coordinated plan in the field of land use could not be fully realized without a similar degree of coordination in the field of water development programs, the Water Resources Committee was established within the Office of the Secretary by Departmental Order No. 1946 under

date of May 2, 1944. The Water Resources Committee acts in an advisory capacity to the Secretary and its functions concisely stated are: the assembly of essential information covering the water-development programs of the bureaus and offices of the Department and other Federal, State, and private agencies; the review of all basic water-development projects or programs proposed to be undertaken by the bureaus and offices of the Department; the preparation for submission to the agencies concerned with water-development programs of statements covering various aspects of such programs with a view to providing definite information thereon and reconciling such conflicts with respect to water use as may develop; the conduct of hearings on problems concerned with the use and development of water resources for the purpose of resolving questions concerning policy; and the formulation of such recommendations to the Secretary as will insure an all-inclusive departmental water conservation policy.

The plan of coordination of land-management and water-development programs, which has been established in the office of the Secretary of the Interior, is a major forward step in the field of administrative management. It insures effective coordination at the top level of administration and the objective sought is achieved through the effective correlation of operating relationships at the lower administrative levels concerned with action programs in the field of land management and water utilization. The time is at hand when these principles of administrative coordination and integration should be extended to all Federal agencies engaged in these fields, for the effective use of land and water will not be at its best until all agencies dealing with these functions have coordinated and integrated their responsibilities and activities.

LAND CLASSIFICATION AND LAND POLICY

Because of the extensive areas and the variable character of the lands under the jurisdiction of the Department of the Interior, there is urgent need for the development of a unified policy of land management. As a part of the staff work for the Departmental Land Policy Committee, the office is cooperating with the land-management bureaus of the Department in preparing a succinct statement of the Department's policies for administering the agricultural, grazing, forest, wildlife, mineral, water, and recreational resources under its control; for acquiring lands needed for essential public purposes; and for disposing of public lands suitable for private ownership. The objectives sought are the clarification of existing policies, the coordination of conflicting policies and procedures, and the formulation of new policies where existing policies appear to be inadequate to protect or advance the public interest in the Federal lands.

PLANNING POST-WAR PUBLIC LAND IMPROVEMENTS

An integral part of the war program has been the planning for maintenance of employment in the post-war demobilization period, during which time men in the armed forces and workers in expanded war industries may be released faster than peacetime industries, with their difficult problems of reconversion, can absorb them. To provide a reservoir of employment opportunities, the land-administering agencies of the Department, in response to a letter from the President dated May 22, 1943, have submitted budgets for planning and blueprinting of construction projects which would produce, if needed, all or any part of an estimated 1,550,000 man-years of employment. The Office of Land Utilization assisted in the preparation of these programs for presentation to the Bureau of the Budget.

FOREST MANAGEMENT

The effect of the World War upon forest administration has been especially significant. The very unusual demand for forest products has been accompanied by a marked shortage of manpower and by an effort to control prices of logs and of manufactured forest products. Every facility for an increase in production has been afforded by the Department. Some operators have been able to increase their production. However, the total production from Department of the Interior lands has shown a reduction in volume over the preceding year. The total cut from Oregon and California revested and reconveyed grant lands was slightly below 400 million board feet with a stumpage value of \$1,321,641. The cut from Indian lands was 423 million board feet with a value of \$1,766,192. Relatively small amounts were cut from public lands in Alaska and the United States.

The act of August 28, 1937 (50 Stat. 874), providing for a conservative administration of the Oregon and California revested and reconveyed grant lands, was the first recognition in Federal law of the principle of cooperative sustained yield in forest management. During the past year this Department joined with the Department of Agriculture and other agencies in requesting from the Congress general legislation that would authorize sustained-yield agreements for all classes of public land administered by the Secretary of the Interior and the Secretary of Agriculture for timber production purposes. This important legislation was secured in the act of March 29, 1944 (Public, No. 273, 78th Cong.).

WAR RELOCATION AUTHORITY

The President, by Executive Order 9102 of March 18, 1942, created the War Relocation Authority, a nonmilitary agency with authority to formulate and carry out a program for the planned and orderly re-

location of persons evacuated from military areas. Acting pursuant to this Executive order, agreements were entered into between the Department of the Interior and the Director of the War Relocation Authority providing for the location of evacuee communities on lands under the jurisdiction of the Department. Agreements were consummated covering lands within the Tule Lake Reclamation Project, Calif., the Minidoka Reclamation Project, Idaho, the Heart Mountain Reservation Project, Wyo., the Colorado River Indian Reservation, Ariz., and the Gila River Indian Reservation, Ariz.

By Executive Order 9423 of February 16, 1944, the President transferred the War Relocation Authority from its status as an independent agency to the Department of the Interior. This action had the effect of eliminating any necessity for continuing further liaison activities by the Office of Land Utilization.

FOREST AND RANGE FIRE CONTROL

With \$530,000 appropriated by the Interior Appropriation Act of 1944, together with \$231,708 previous year balances reappropriated, the emergency fire control program of the Department of the Interior was continued during the year. This program, an essential war activity, supplements and augments normal fire protection for the forest and range resources situated on the forest, brush, and grass lands of the Department located within a 300-mile zone of the Atlantic and Pacific coasts and the Gulfs of Mexico and California.

There are approximately 400 million acres of forest, brush, and grass lands requiring protection from fire under the jurisdiction of the bureaus and agencies of the Department of the Interior in the continental United States and Alaska. Of this total acreage approximately 272 million acres lie within critical zones and have required special protection during the war. These lands support some of the finest stands of virgin timber left in the United States, together with other resources all of which are playing an important part in the present war emergency. Protection of these resources from sabotage, direct enemy action, and normal fire risks is a major responsibility of the action agencies of the Department of the Interior.

The responsibility of the Department to protect the resources and related strategic facilities located on or adjacent to lands under its jurisdiction has been most satisfactorily met during the past 2 years. The normal fire control protection organizations, assisted by approximately 500 trained guards and standby crewmen made available through the emergency fire protection program, were able to hold fire losses to low levels, and thus prevent the disruption or destruction of important war activities.

Cooperation between the Department of the Interior, the Department of Agriculture, and the War Department continued at a high level throughout the year. The Forest Fire Fighters Service perfected its organization and trained approximately 200,000 volunteer civilian fire fighters for prevention and suppression work in 44 States. The assistance rendered by the Forest Fire Fighters Service to all organized fire protection agencies has proved to be very valuable and especially so to some of the action agencies of this Department.

Excellent results have been achieved in the coordination of fire control work on all Department of the Interior lands during the war. However, provision has yet to be made for increased regular appropriations which will insure adequate protection for the entire 400 million acres under the management of this Department.

WHITE PINE BLISTER RUST CONTROL

White pine blister rust control operations on lands administered by the Department of the Interior were continued during the fiscal year 1944. These operations are designed to protect the valuable five-needle pines from the white pine blister rust, a fungus disease of foreign origin which became established in this country approximately 30 years ago. The actual control work consists of the eradication of *Ribes* (currant and gooseberry bushes), the alternate hosts of the disease. The act of April 26, 1940 (54 Stat. 168-169), provides that all white pine blister rust control operations be combined as one appropriation to be carried in the annual appropriation act of the Department of Agriculture. For the fiscal year 1944, \$170,747 was appropriated for white pine blister rust control work on Department of the Interior lands and made available to the National Park Service, the Office of Indian Affairs, and the Oregon and California Revested Lands Administration of the General Land Office.

Progress in the control operations on Department of the Interior lands during the war has been necessarily slow and has barely kept pace with the spread of the disease. In the calendar year 1943, 9,446 acres were worked for the first time and 15,143 acres were reworked.

CIVILIAN PUBLIC SERVICE CAMPS

Section 5 (g) of the Selective Training and Service Act of 1940, approved September 16, 1940 (54 Stat. 885), provided that persons who by reason of religious training and belief were conscientiously opposed to participation in war should not be subject to combatant training and service in the land or naval forces of the United States, and further provided for the assignment of such conscientious objectors to noncombatant service or to work of national importance under civilian direction.

Prior to July 1, 1943, all Civilian Public Service camps were sponsored by the National Service Board for Religious Objectors and the costs of operating the camps, except as to the work program, was financed by that organization. On July 1, 1943, Civilian Public Service Camp No. 111 was organized at Mancos, Colo., under the supervision of the Bureau of Reclamation, and full responsibility for both housekeeping and the work project at this camp was assumed by the Government. Two other government-operated camps, namely, Civilian Public Service Camp No. 128 at the Deschutes Reclamation project (Oregon), and Civilian Public Service Camp No. 135 at the Seney National Wildlife Refuge (Michigan), were placed in operation during the year.

All camps on Department of the Interior lands, of which there was a total of 11 at the close of the year, continued to give first priority to the protection and conservation of natural resources, including fire, insect, and disease control.

PRISONER-OF-WAR CAMPS

On November 8, 1943, the Secretary advised the Provost Marshal General of the War Department that the Office of Land Utilization had been selected to represent the Department of the Interior with respect to all proposals pertaining to the use of prisoner-of-war labor on Department of the Interior lands.

Following the establishment of this liaison relationship a request was made to the War Department for clarification of its policy with respect to the compensation to be paid by Federal agencies for prisoner-of-war labor. As a direct result of this request the War Department issued instructions which provided that the sponsoring Federal agency reimburse the War Department for the aggregate cost of prisoner-of-war labor at the rate of 80 cents per day for wages and approximately 65 cents per day for subsistence.

As of June 30, 1944, only one contract had been consummated with the War Department by an agency of this Department, namely, the Fish and Wildlife Service. However, it is expected that this source of labor may prove helpful in relieving shortages which have developed in connection with slash disposal on Indian reservations and in the construction of access roads.

Grazing Service

C. L. FORSLING, Director

THE IMPORTANCE in war of land, minerals, food, fibre, and other materials derived from the soil has been emphasized throughout the fiscal year. To help mobilize these resources on grazing district lands so they may be utilized to the full extent in the war program has been foremost in the work of the Grazing Service. Many of its peacetime "musts" have been postponed until victory is won.

The Federal range is extensively used in many ways for the training of men and the development of machines and skills for war. Practice bombing ranges, flying schools, mine roads, supply dumps, and many other similar activities and uses tell the story of the part these lands are playing in the war program.

Range Administration.—In the 10 years since the passage of the Taylor Grazing Act progress has been made in the accomplishment of the proper use of the grazing district range. This has made it possible for these lands better to play their part in the production of livestock for war needs. Regulation of the range has eliminated the migrant herds which formerly menaced the stability of the local livestock industry. The consumption of vast quantities of forage by horses that are no longer useful as domestic animals has been greatly reduced, and the reduction in overstocking coupled with better seasonal use affords better growth of forage.

Most effective of all perhaps has been the stabilization in the use of the range by the dependent livestock operators and the elimination of ruthless competition. Those who are entitled to use the range now have reasonable assurance that they will have the benefit of the available forage and may plan their livestock operations with greater certainty.

In spite of these accomplishments, however, numerous jobs remain undone. Many areas need closer determination of grazing capacity and the application of better management practices in order to restore

the productivity of the range which was dissipated through the long period of unregulated use. The complicated land ownership pattern which developed prior to the establishment of the grazing districts calls for the development and execution of land exchanges whereby private, State, and railroad land is exchanged for Federal range and the exchange of use of land to simplify range administration to the advantage both of the Government and the range users. Vast areas need to be reseeded. Many improvements such as watering places, drift and division fences, and other facilities should be constructed to afford better management and more even utilization of the grazing resources. Protection from fire is still inadequate. Rodent control, to reduce the waste of range feed, needs to be expanded. These are jobs to be undertaken as soon as enough manpower and enough facilities are available.

It is the wartime policy of the Grazing Service to assist and encourage stockmen in every way possible, consistent with long-time policies, to produce more meat, wool, and other livestock products to meet the needs of war. It includes the following general principles: (1) increased use of Federal range wherever possible and consistent with good range management; (2) removal of surplus horses and the harvest of surplus game and their diversion to food channels; (3) increased protection to reduce the loss of forage and damage to the productive capacity of the soil by fire; (4) the adoption of practices and emergency activities, such as opening snow-blocked trails, to reduce livestock losses; (5) better management of both range and livestock.

Increased range use was attained by allowing extended grazing periods, by a system of war emergency licenses and by the trend of the industry toward more cattle and fewer sheep. During the fiscal year, 1,497 war emergency licenses were issued for 70,319 cattle, 993 horses, 145,700 sheep, and 4,513 goats.

A comparison of range use during the years 1940 to 1944 (using 1940 as 100 percent) shows that the number of animals licensed and permitted have been increased by 6 percent in the 5-year period and the total amount of range use permitted has been increased by 15 percent.

Whether this increased use is consistent with the sustained yield and further increase in productive capacity of the range is a matter for immediate consideration after the close of the war. The extra use has been permitted as a temporary war-emergency measure and must be curtailed wherever necessary as soon as the emergency has passed.

Action under the Secretary's orders of March 16, 1943, and January 29, 1944, resulted in the removal of 32,920 surplus horses from grazing districts, an increase of 7,647 over the number removed in 1943. A total of 77,163 horses have been taken from the Federal range and adjacent territory during the past 2 years. These have been diverted

to many useful purposes. At the same time, thousands of acres of range formerly used by these horses have become available for cattle, sheep, and wildlife.

Despite an increased harvest of big game in grazing districts, the numbers increased by about 30,000 over the previous year. Cooperative game counts in sample areas and inventories gathered from many sources indicate that approximately 535,000 big game animals inhabit grazing districts during a part or all of the year.

Licenses and permits.—The number of licensed operators increased from 22,019 to 22,562, a gain of 543, and involved 10,694,305 livestock, by classes as follows: cattle, 1,990,272; horses, 127,701; sheep, 8,482,387; goats, 93,956. The statistical detail is shown by regions on table I at the end of the chapter.

The trend toward more cattle and fewer sheep in grazing districts followed the national wartime pattern. In the 5-year period (1940–44) cattle numbers licensed have increased 27 percent and sheep have decreased 16 percent. Sixty-four percent of the range operators were on a term permit basis at the close of the year.

Criticisms from many quarters calling attention to illegal use of the range are supported by records which show a greater number of trespass cases during 1944 than for any previous year. Current high prices for livestock, coupled with the extra grazing load and inadequate facilities for complete range supervision have encouraged trespass. This circumstance is in need of correction and can be met if and when additional personnel is provided.

Range surveys and utilization checks.—Range surveys were completed on 738,630 acres and grazing capacity estimates rechecked on 6,281,565 acres during the year. The area covered by original range surveys (598,463 acres) was the smallest coverage since the inception of this type of work in 1936. To date 114,326,240 acres have been covered by range surveys in 10 States. Since the pattern of grazing use as well as of land ownership is interwoven with Federal, State, and private lands, such surveys include a comprehensive examination of all the lands involved. Approximately 100 million acres to be surveyed in grazing districts are included in plans for post-war work, as it is anticipated that our trained personnel, many of whom are now serving in the armed forces, will again be available.

Appeals and hearings.—During the fiscal year, 142 appeals from administrative decisions were filed, an all-time low. Of these, 67 were disposed of and 75 were pending at the close of the year. Twenty of the cases disposed of were settled without formal hearing. Ten decisions of examiners were appealed to the Secretary.

Land activities.—For the third successive year primary emphasis in grazing district land matters was given to military needs. During the fiscal year 1944, 1,357,000 acres were eliminated from grazing districts

for war purposes and 11,676,000 acres were involved in military use permits. These include bombing ranges, gunnery ranges, precision bombing sites, airfields, storage dumps, depot installations, chemical warfare proving grounds, troop maneuver areas, rights-of-way for telephone lines, water pipe lines, and military roads. The livestock producers cooperated to the fullest extent in adjusting their range affairs in order that military requirements could be met.

Certain land uses for military purposes became unnecessary during the year. Also, certain military programs demanded only temporary occupancy of public lands for training purposes and, having served the purposes for which they were withdrawn, they were restored to grazing use. During the year, 1,351,000 acres of such lands were returned to Grazing Service Administration.

As of June 1944, 24,168,532 acres of grazing district lands in nine States were used for military purposes, of which 14,428,919 acres are federally owned.

There are a number of reasons why these lands are selected for military uses despite their importance for food production. Among these are: (1) their relatively low cost to the Government, (2) distance from population and industrial centers, and (3) favorable climate and topography for large-scale training operations.

Military agencies were assisted by the Grazing Service in the joint examination of areas proposed for withdrawal, special use, and alternate use. Maps, data, and technical assistance were furnished in connection with the appraisal of ranch and range areas to establish equitable settlement values under the act of July 9, 1942 (Public, No. 663, 77th Cong.). Advice and liaison were provided the Army Claims Board and enabled it to settle more promptly for alleged damages to private property in connection with troop maneuvers.

Prior cooperative agreements with bureaus in the Department were continued and new agreements for further cooperation on mutual problems were initiated. Close cooperation in these and related activities helped to maintain balanced livestock activities in the regions while affording both grazing and military uses of a number of important range areas.

Careful study was given to post-war uses of lands now devoted to military operation. Substantially all of these lands will be restored to grazing administration when they have fulfilled their present purposes. As a result of these uses and the various types of installations considerable repair is anticipated not only of the land itself but also of the livestock facilities.

Under the act of June 5, 1942 (Public, 586, 77th Cong.), the Grazing Service reported favorably on a number of applications to purchase timber growing on the Federal range, when the investigation showed that the lumber was to be used in connection with production of equipment for war.

At the beginning of the fiscal year, 209 applications were pending in the Grazing Service, involving rights-of-way, entry, exchange, and sale under sections 6, 7, 8, and 14 of the Taylor Grazing Act and the 5-acre law of June 1, 1938. Seven hundred and thirty-two such cases were received during the year, and 747 were disposed of, leaving a total of 283 pending at the close of the year. Favorable action was taken on 8 motion-picture permits, 72 cases involving disposal of improvement on canceled homesteads, and 564 applications for domestic use of timber within grazing districts.

Since actions on land matters having to do with war needs took precedence, full progress on earlier plans for consolidation of the federally owned land by the exchanges for private, State, and county land and by additional leases under the Pierce Act was retarded in some regions. Detailed, long-time plans to fit into range development and post-war activities were under way in 10 districts, involving approximately 40,000,000 acres in 10 States. These were in the process of preparation in written form at the close of the year.

Status of grazing districts.—Orders were issued establishing 2 additional grazing districts during the year, bringing the total to 60 in 10 States. Data and other essential material were assembled looking to the establishment of other districts or the addition to established districts in 3 States. Status changes during the year included, in addition to military withdrawals, 36 orders vacating former reclamation withdrawals, totaling 550,000 acres; revocation of stock driveway withdrawals involving 720,000 acres; and allocation of 50,600 acres for development under the Department's reclamation program. Grazing district acreages are shown by regions on table II at the end of the chapter.

Funds.—Congress provided \$1,070,700 for the operation of grazing districts during the fiscal year 1944. Of this amount \$978,700 was for over-all administration, including presuppression of range fires; \$83,000 for construction and maintenance of range improvements; and \$9,000 for leasing of lands under the Pierce Act. Contributed funds and allotments for soil and moisture conservation work, for fire suppression, and for miscellaneous items totaled \$912,283.55. The Public Roads Administration transferred to the Grazing Service \$1,446,500 for construction of access roads under the Defense Highway Act, as amended.

Grazing fees.—Earned grazing fees in the grazing districts totaled \$813,351.96. Of this amount \$406,584.32 was paid to the States affected and \$183.43 was deposited to the credit of Indians under provisions of the Taylor Grazing Act. State revenues derived from grazing fees during the 9-year period, 1936 to 1944, now total \$3,062,047.34. Moneys paid to States as a result of grazing fees earned in the fiscal year 1944 are as follows: Arizona, \$18,484.26; California, \$10,087.20; Colorado, \$27,056.36; Idaho, \$37,321.96; Montana, \$28,-

515.37; New Mexico, \$60,337.92; Nevada, \$65,051.35; Oregon, \$26,980.31; Utah, \$74,063.15; Wyoming, \$58,686.14. The flat rate of 5 cents per month per head for cattle and 1 cent per month for sheep over 6 months of age, with some exceptions, continued to be charged as the grazing fee in grazing districts. The authorizing act provides for "the payment annually of reasonable fees in each case to be fixed or determined from time to time." The task of determining a "reasonable fee" for the wide variety of conditions found on the public range in 10 Western States is not a simple one. The fact finding and analysis necessary to its accomplishment were interrupted on the entry of our country in the war by other activities incident to meeting war needs. This undertaking cannot be delayed much longer.

Audits.—Audits were completed in 6 of the 10 regions during the year. It was impossible to keep current this important phase of the work due to the shortage of personnel qualified to handle these matters.

Job load analyses.—Analysis of work load in the grazing districts, begun 2 years ago, was completed during the fiscal year just closed. The data were assembled and a method of rating the districts on the basis of minimum personnel needs was developed. They emphasize the excessive overtime of present personnel and that many jobs are being slighted because of inadequate manpower.

Training and personnel.—The high percentage of personnel turnover, particularly clerical, has made on-the-job training a daily requisite. In the conduct of action programs and to meet changing conditions incident to war demands, conferences were held at all levels in the national, regional, and district offices as often as time and funds would permit.

Temporary wage employees decreased 36 percent and salaried workers increased 10 percent during the year. The number of employees in military service totaled 173 at the end of the year, an increase of 39.

Equipment and supply.—The state of repairs of power machinery and automotive equipment needed to prosecute action programs is at a low ebb and great difficulty was experienced during the latter part of the fiscal year in obtaining competent repair of units. Maintenance costs of old, worn-out units have been excessive.

Range development.—To conserve manpower and material, primary consideration has been given to maintenance work on existing range improvements for the duration. Approximately \$150,000 was expended during the year for this purpose. However, in addition to public funds the ranchers in many localities contributed an unrecorded amount of labor in maintaining thousands of small projects of various types, mainly springs, wells, reservoirs, corrals, and fences. Whenever new construction was undertaken during the year the matter was first considered on its merits. That is, whether it would pro-

mote beneficial use of the range, add to food supplies, and aid producers to overcome critical labor shortages. In this light a considerable number of fencing and water development projects were pushed to completion. On one-half of all the range-improvement projects completed during the year, stockmen furnished either the labor or the material or both. Despite the handicaps occasioned by shortage of parts, the facilities such as windmills, pumps, and other installations at principal stock-watering places were maintained in serviceable condition. This was accomplished by use of salvaged equipment and substitutes in certain instances. A summary of range improvement projects completed is shown on table III at the end of the chapter.

Under section 4 of the Taylor Grazing Act fences, wells, and other facilities for handling of permitted livestock on the range may be constructed and maintained by the range users. A total of 432 permits to construct and maintain such improvements and 92 permits to maintain existing facilities were issued during the year. These have an estimated value of \$332,572.50, an item of expense that is borne by the range users themselves.

Soil-and-moisture conservation.—Soil-and-moisture conservation work to restore depleted range lands was conducted during the year on 60 of the 95 project areas approved by the Office of Land Utilization. Gully plugging and area treatment to arrest wind and water erosion and fencing to prevent misuse of treated areas comprised the principal class of activity in this connection. Since the rehabilitation of ranges is integrated with activities authorized by the Taylor Grazing Act, the soil and moisture conservation work was augmented by contributions from the range improvement funds and by donations from cooperating individuals and groups.

Range protection.—Range fires consume large quantities of resources needed for victory. They draw manpower from important work, aid the Axis, and prolong the war. Everything possible is done to keep such fires down to an absolute minimum.

Due to a late spring in 1944 fire occurrence during the latter half of the fiscal year was only about 50 percent of expectations. Throughout the past year weather conditions were more favorable from a fire-hazard standpoint than for many years. Encouraging results from training and organization for fire suppression are shown by a reduction in both number of fires and acreage burned.

A burn of three-quarters of a million acres is too great a loss, however, considering in addition to the value of the forage destroyed the interruption of going livestock operations, the damage to the productive capacity of the range, and the soil erosion and watershed menace thus created.

In training and educational programs emphasis is given to fire prevention. During the year, 86 training meetings for per diem guards and 114 meetings for training under the Forest Fire Fighters Service Cooperative System were held in grazing districts. At these schools a total of 3,419 men received instruction in techniques. In addition, 1,373 cooperative fire fighters, mostly farmers and stockmen, were given spot training in fire fighting methods and prevention. Since almost 80 percent of the fires that occur on the Federal range are man-caused the protective measures include constant educational campaigns. As a result of these cooperative efforts, which were aided by favorable weather conditions, the 1,085 fires last year burned 748,138 acres as compared to 1,128 fires which burned 1,734,992 acres the previous year.

Drafting.—During the year the drafting facilities of the Grazing Service continued to serve the Army and other war agencies at the expense of much needed regular work. About 60 percent of the volume was for various branches of the Army and included blueprints, photostats, tracings, drawings, and drafting of air bases, buildings, installations, supply depots, land status plats, etc. At the peak of Army demands for this type of work, the Grazing Service recruited, trained, and supervised certain temporary employees attached to the War Department pay roll.

Access roads.—One of the outstanding Grazing Service contributions to the war program is the construction of access roads to sources of raw materials. From the inception of the access road program in 1942, 1,570 miles of such roads have been built to 20 types of metals, minerals, and other war materials in 8 States. During the fiscal year 788 miles were completed at a cost of \$1,171,293. As a part of the Department's war program, the building of these roads has stimulated the small, independent operator to rush his diggings, and the emphasis on production of these vital materials has shifted with the progress of the war. For instance, in the early days of war production great shortages existed in the steel alloy materials. The road program then was directed to deposits of vanadium, chromium, manganese, and tungsten. Later the needs for coal, timber, petroleum, and certain non-metallic minerals shifted the emphasis to such products. There are many rungs in a ladder which reaches from the bottom of a mine shaft to a battle front, and an access road is one of them. Over such roads go truck loads of mica, gilsonite, manganese, vanadium, lead, zinc, coal, and many other basic ingredients of tanks, planes, guns, explosives, and precision instruments.

Post-war plans.—During the year the Grazing Service submitted to the Department general plans for a much needed post-war range-improvement program, which would employ 31,000 men for a 3-year

period at an estimated cost of \$226,000,000. This involves 60,000 projects of 16 major types, widely distributed in 60 grazing districts, and can be implemented within 3 months after victory. The plan contemplates 150 camps of 100-man capacity as well as the employment of 7,500 men on work convenient to their homes. Of the total expenditures contemplated in this program nearly \$200,000,000 would be for wages in 200 counties. Already 5 percent of the listed projects have been approved as to location and type of structure. To expedite the program in the event of an unemployment problem after the war, funds are needed now to provide the necessary detailed surveys, specifications, and plans for launching the program promptly at the proper time. In accordance with the President's request of May 23, 1943, and supplemental Department instructions, the Grazing Service submitted in August 1943 an estimate showing the need for \$3,000,000 to cover detailed engineering and planning costs of its post-war program.

TABLE I.—Number of licensed operators and livestock in grazing districts by regions, June 30, 1944

Region	Licensed operators	Cattle	Horses	Sheep	Goats	Total livestock
Arizona.....	612	98,062	2,253	140,558	11,145	252,018

¹ The total number of completed projects as reported for the period 1935 to June 30, 1944, includes projects acquired, such as drought relief and other emergency structures which are now recorded as grazing district improvements.

Fish and Wildlife Service

IRA N. GABRIELSON, Director

THIS Service is the Federal custodian of the Nation's vast fish and wildlife resources, and in cooperation with the various State and Federal agencies, organizations, and individuals has the responsibility to see that this valuable natural asset is fully maintained and wisely managed.

America's predominant position in the commercial fishing industry of the world must be maintained. Post-war competition among nations for the food resources of the high seas and even of coastal and the larger inland waters will be greatly intensified. That the resources may be utilized in accordance with sound principles of conservation and management the Service is helping the commercial fishery industries to organize for expansion and is acquainting them with the most modern technological and scientific methods.

At the present time fishery products rank fifth among food resources of the Nation, and in addition supply vitamins, oils, fish meal for livestock and poultry foods, and byproducts for industrial uses. If the fishery industries are to maintain a constant flow of these materials essential to our economy, and if they are to realize in the near future the potential 7-billion-pound yield of fishery products a year, governmental assistance will be necessary in the form of scientific direction. The providing of facilities for technological engineering and scientific improvement of fishing and of processing, distributing, and marketing fishery products is well adapted to a post-war program of public works. Such facilities will include experimental stations and research laboratories, vessels for the development and exploration of fishing grounds, and fact-finding surveys to provide comprehensive inventories of the status of the industry.

Hunting, fishing, and recreation play such an important part in the life of the American people that planning and construction projects designed to perpetuate the wildlife resources are being given a prominent place in post-war planning.

A 3-year development program for wildlife conservation has been outlined. Work plans are now available for the employment of some 12,000 persons. In addition it is estimated as a result of these projects that another 4,000 persons will receive employment from private industry in the production of materials, supplies, and equipment. Additional programs are being formulated that will provide at least 8,000 persons with employment in development operations and 1,500 persons with employment in private industry. This 3-year program for the continuation of wildlife development projects will cost approximately \$115,000,000.

The Fish and Wildlife Service program for the protection, development, and utilization of fish and wildlife resources involves a wide variety of activities. The more important of these are: Construction and development of wildlife refuges, fish hatcheries, and rearing ponds; stream and lake improvement; tree planting on refuges; range revegetation; marsh conditioning; and other management practices including controlled burning, as well as prevention and suppression of uncontrolled fires—all designed to improve living conditions for wildlife.

ECONOMIC FISHERY INVESTIGATIONS AND PROGRAMS

Studies in fishery economics have been completely adjusted to war needs. For the first time data have been collected from fishery unions on membership and movements. Tables have been established which indicate the classification of labor in the fishery industries according to sex, age groups, and occupations. Occupation titles and definitions also have been studied. The material was successfully used in presenting to the War Manpower Commission and the Selective Service System the case for adequate recognition of the needs and importance of the fishery industries.

These labor studies will be the bases for analyses of post-war labor problems which will extend especially to wages and hours, to collective bargaining, and to the seasonal character of fishery labor. It is planned to establish a labor unit for the specific purpose of collecting data and studying the problems involved. This will contribute indirectly to reemployment after the war and to the solution of the fishery industries' social security requirements which up to now have not received adequate consideration in Federal and State legislation.

A survey of the financial condition of fishery cooperatives was made for a report to the Ways and Means Committee of the House of Representatives on a bill which provides for the exemption of cooperatives from certain taxes. The material collected will be the basis for future studies on cooperatives, a type of fishermen's association which will be of increasing importance in the post-war period.

A survey made in 12 cities during January and February for the purpose of determining the effect of Office of Price Administration's retail Maximum Price Regulation 507 on the retail price and consumption of fresh fish indicated that the regulation was beneficial as it made available to a large number of consumers an increased poundage of fish at lower prices. To prevent disruption of the usual channels of production and distribution, a survey of 1942 fresh-fish prices was outlined, conducted, and supervised in cooperation with Office of Price Administration in order to find a fair and equitable basis for fish prices at production and wholesale levels. The same consideration prevailed in an extended study of cost increases in the fishery industries from 1941 to 1943 and to prevent an eventual unadjusted recession of prices to pre-war levels. The cost survey will establish samples of cost ratios for normal and for war years to which any individual enterprise can compare its own costs and profits. Both the price and cost surveys will be continued, the results being important to the solution of post-war problems.

CONSUMER RELATIONS

Efforts made during the fiscal year to obtain maximum benefit for consumers have led to wider dissemination of fishery facts and to the marketing of new and little used varieties of fishes. Although these programs develop slowly there is every reason to expect that their war impetus will be effective in promoting increased fish consumption to a considerable degree in the post-war period.

COLLECTION AND PUBLICATION OF FISHERY STATISTICS

The collection and publication of information relating to the quantity and value of the commercial catch of fishery products in the United States, the employment of fishermen, shore workers, fishing craft and gear in the industry, and the production of manufactured fishery products was continued. Due to the loss of agents to the armed services and also through the assignment of members of the statistical staff to assemble information required by war planning and regulatory agencies, it was necessary to curtail the regular statistical surveys. However, the collection and publication of certain additional current information required by the industry and Federal agencies concerned with the fisheries was undertaken.

FISHERY MARKET NEWS SERVICE

This service assists the orderly marketing of fresh, frozen, and cured fishery products by disseminating to fishermen, shippers, wholesalers, buyers, and consumers, current information on production, shipments, prices, supply, and demand. Field officers at New York, Boston, Chi-

cago, Seattle, and New Orleans, issued daily and monthly reports during the entire fiscal year, but the Jacksonville office was closed after only 2 months' operation, due to curtailment of funds. In addition to the supply and demand data in the daily reports and monthly summaries, the market reports reprinted all Federal orders, in full or in condensed form, which affected fishery production, marketing, or supply. The inclusion of these regulations, immediately upon issuance, provided the only current source of such information to the fishery industries.

Fishery Market News, a monthly review, also carried special articles of interest to the industry, more complete texts and interpretations of Federal orders, and a monthly index of Federal regulations. Market News data has been extensively utilized by other Federal agencies to determine ceiling prices on fishery products, in transportation studies, in allocating catches, and in distribution surveys. The demand for these data and the need for expanding and adapting Market News procedures to meet war requirements is expected to continue in the post-war period when production and distribution problems, though different, will be equally acute. To meet these demands, additional Market News offices will be required to collect data for those sections of the country from which current information on production, imports, markets, and distribution is not now being received.

STUDIES TO IMPROVE METHODS OF PRODUCTION AND USE OF FISH

The fishery technological laboratories at Seattle, Wash.; College Park, Md.; Ketchikan, Alaska; and Mayaguez, P. R., continued to be completely occupied with researches aimed to relieve difficulties caused by material and manpower shortages that have handicapped the fishery industries. Such difficulties may exist for a considerable time in the post-war period, particularly if large quantities of fishery products are required for export. Current technological advances therefore, will have continuing and world-wide application.

Specially prepared packs of all types of fish and shellfish, both fresh and processed, were subjected to storage and shipping tests to determine the most practical solution to the critical tin shortage. After many field and laboratory tests, recommendations were made for the most effective use of available fibers for cordage and nets. Chemical and bacteriological studies resulted in improved methods for extracting agar and related seaweed gums. Investigations of present and possible vitamin-A resources provided information for their intelligent exploitation. Improved methods of handling and processing fish livers also were developed.

To increase the Nation's food supply, the laboratories developed new canned fish products and demonstrated the utility of numerous kinds of fish and shellfish formerly neglected. In order to increase the utili-

zation of fish as food, improved handling and processing methods and new recipes were evolved.

Upon its request, the Army Quartermaster Subsistence Laboratory was furnished technical assistance in solving fishery problems by the detail of an experienced fishery technologist.

On the basis of completed and proposed researches, the laboratory staffs are prepared to make recommendations which will enable the fishery industries to satisfy the expected demands of post-war markets for improved methods, equipment, and products.

THE ROLE OF GAME FISH AND HATCHERIES

Since the outbreak of hostilities, the general public has realized more than ever before the tremendous value of this country's fishery resources. While at the present time first place must be assigned to the amount of nutritious food involved, the recreational value of angling is of utmost importance under the stress of wartime living. Continued maximum use of the fishery resources cannot be attained by a static policy of merely guarding them against unwise utilization. Therefore, the Division of Game Fish and Hatcheries has realigned its program to include management principles. Up to a short time ago the Division had been concerned largely with producing hatchery stock—the raw material of fisheries management. While for various reasons it will not be possible to put this revised program into full operation until the post-war era, the foundation is being laid as rapidly as manpower will permit.

During the present emergency, the value of a properly constructed and managed farm pond has been fully demonstrated. Such ponds are producing thousands of pounds of edible fish annually, but owing to restrictions upon the heavy equipment required for constructing the impoundments, the program has not reached its peak. When conditions return to normal, it is anticipated that in some States 45 percent of all farms will have one or more ponds. The Division of Game Fish and Hatcheries is expanding its studies on the stocking and managing of farm ponds for the purpose of obtaining more fundamental information so that greater yields may be derived from the ponds that are developed in the future.

BIOLOGICAL INVESTIGATIONS OF THE FISHERIES

The very nature of biological control of the fisheries and the necessity for keeping in mind future goals as a guide for current action has stimulated careful thought on plans to be consummated after the war. Restriction of theoretical studies was continued as more men than during last year were detailed to the staff of the Coordinator of Fisheries. Unpredicted changes have occurred in the fisheries of the Nation, changes the significance and magnitude of which must

be noted now so that their bearing upon the future management will not be forgotten.

As usual the work was conducted on a regional basis. In the North Atlantic area studies related especially to the rosefish and yellowtail flounder, the yield of which will decrease considerably unless practical remedial measures can be developed. On the other hand, fishing pressure on both the haddock and lobster populations has been reduced considerably as the result of wartime boat and manpower shortages. Observations on their recovery will be of aid in maintaining and increasing the yield in post-war years.

In the Middle Atlantic area studies of the shad fisheries indicate that all the major producing streams can be restored to full production by the abatement of pollution, in some cases, and by provisions for a larger spawning reserve in others.

Investigations in Alaska were directed toward maintaining maximum production of the fisheries and toward collecting data for their proper management in the post-war period. These were concerned particularly with the salmon populations of Bristol Bay, Brooks Lake, and Karluk River. The commercial catch of pink salmon in southeastern Alaska was disappointing with a total production of 1,035,000 cases, only a fourth of the 1941 yield. Studies carried out at the Little Port Walter Station indicated an unfavorable change in returns in the "test stream" at this location. Herring production in Alaska showed a substantial increase with a total yield of 84 million pounds as against 38 million pounds for 1942. Predictions of the age-composition and probable abundance of herrings were made for the season of 1944, from which it appears that the prospects of this fishery are very good.

The sablefish industry has expanded rapidly under wartime demands, the commercial catch of the past season amounting to approximately 4 million pounds. A survey was undertaken to appraise the probable effect of this increased fishing intensity and to determine the need for regulation. This species has been accepted as an excellent food fish and it is probable that there will continue to be a considerable demand for it after the war.

In South Atlantic and Gulf areas observations on the effects of war conditions on our shrimp fisheries have been continued. This information will be of great value in the formulation of principles for future management. Close watch and collection of data on the fast-expanding offshore shrimp fishery have been maintained as developments there will be important in the future of the industry.

Research on the pilchard fishery of our southern Pacific coast is directed toward learning the size and productivity of the resources and toward measuring the response of these quantities to different levels of fishing intensity. Results achieved during the past year have demonstrated that fluctuations in year-class strength are highly

correlated with fertility of the sea, as reflected by surface salinity. The abundance of the resource was found to be indicated, to a high degree, by the size of the two age classes which ordinarily dominate in the California fishery and by the amount of fishing effort 3 years previous to each season. With the return of post-war facilities, considerable benefits may be expected to accrue to the industry from the increased understanding of the trends and fluctuations in the pilchard fishery.

In the Great Lakes area, exhaustive studies are needed on the lake trout, the most valuable of the Great Lakes commercial species. It is especially urgent that the relative effectiveness of artificial and natural propagation of the species be investigated.

Analysis of conditions, which in the past have been impeding the progress of the shellfish industry, shows that depletion of natural oyster grounds and pollution of inshore waters are the two principal factors responsible for decline in the production of oysters and clams, and that introduction of a definite State-management plan of exploitation is necessary for the rehabilitation and planned utilization of these natural resources.

The rapid development of many new industrial processes, and sanitary engineering procedures, attendant on the war have created water-quality problems which will persist to the serious detriment of the proper post-war development of national fisheries unless adequately controlled. Accordingly, systematic studies of these new effluents and other substances which can affect our aquatic resources detrimentally have been made or are in progress to provide specific scientific definitions of the hazards which these materials present to fish and other aquatic life.

After determining the noxious fractions of the various wastes and effluents, attention has been given to the chemical and physical properties of these fractions looking toward their transformation into innocuous or useful products. Practical approaches for the elimination of harmful effluents by utilization have been suggested to the managers of several plants and are now in successful operation. This work has increasingly demonstrated that practically all industrial pollution is not only unnecessary, but that in many instances commercially feasible processes of utilization can be developed which will pay part or all of the elimination expenses and may even show a profit.

War conditions have closed several plants that formerly poured large quantities of destructive wastes into certain streams and it has been possible to observe the return of these streams to normal fish productivity after cessation of the industrial pollution. These findings show that following the elimination of industrial pollution many streams will return rapidly to valuable fish production. It has

been found that very dilute pollutants present in quantities much too small to be directly harmful to fishes may, nevertheless, in time completely eliminate all fishes from the polluted waters.

PROTECTION OF THE ALASKA FISHERIES

Protection of the fisheries of Alaska has continued with the purpose of permitting maximum commercial utilization of the resource consistent with a stabilized yield on a high level of productivity in perpetuity. Every question raised with regard to promulgation or adjustment of regulations has been answered in favor of conservation as against exploitation.

The need for greater production of food fishes, during the war years and in the post-war period, has not gone unrecognized, however. Increased emphasis has been placed on careful observations of fishery runs; regulations have been made more flexible to permit announcements of seasonal extensions when runs are above expectations; as a result, in 1943, 119 additional fishing days were permitted, and catch limitations on herring were raised 6,250,000 pounds. An increase of 36,536,405 pounds of fishery products over 1942 production was realized, of which 24,032,224 pounds represented the increase in the output of canned salmon.

FUR-SEAL INDUSTRY

The year ending June 30, 1944, was notable in that the take of 117,164 fur-seal skins on the Pribilof Islands was the largest number ever secured under controlled conditions. The largest previous annual take was 110,585 skins in 1874. The byproducts plant produced 782,000 pounds of seal meal marketed primarily for stock and poultry feed, and 75,259 gallons of seal oil sold for leather-tanning processes.

In May 1944, the natives of the Pribilof Islands, together with supervisory personnel, were returned from Funter Bay in Southeastern Alaska, to the Pribilofs from which they were evacuated for security reasons in June 1942. This will reestablish sealing and foxing activities on a normal basis, and permit the expansion of the present byproducts plant, for which funds have been appropriated, to utilize all seal carcasses on St. Paul Island.

During the fiscal year 1944, two public auction sales of fur-seal skins were held at St. Louis, Mo., for the account of the Government. On November 1, 1943, 17,525 dressed, dyed, and finished skins sold for \$717,147.40 and on June 19, 1944, 21,742 skins were sold for \$795,397. Also, 3 confiscated skins were sold for \$1.50. In the same period, 230 skins were sold at private sales for promotional purposes, under special authorization of the Secretary for \$11,165. Total gross sales during the year amounted to \$1,523,710.90.

Of particular interest to conservationists was the act of February 26, 1944, giving effect to a provisional fur-seal agreement entered into

with the Canadian Government in 1942, and superseding the acts of April 21, 1910 and August 24, 1912. The terms of the new law, made necessary by the abrogation of the fur-seal treaty of 1911 by Japan, 6 weeks before the outbreak of the present war, provide for continuing protection of the fur seals of the North Pacific, and for a division of the skins on the basis of 80 percent to the United States and 20 percent to Canada.

COOPERATIVE PREDATOR AND RODENT CONTROL

Predator and rodent control operations conducted on a cooperative basis with other Federal agencies, States, counties, municipalities, livestock grower and farmer organizations, and individuals played an important role in furthering food and fiber production and conservation. Sheep, cattle, and poultry were saved from destruction by coyotes and other predators and stored foodstuffs, agricultural crops and other vital materials were protected from the onslaughts of rats and field rodents.

In predator control operations 118,879 predatory animals were taken, consisting of 108,050 coyotes, 1,170 wolves, 8,900 bobcats and lynx, 167 mountain lions, and 592 stock-killing bears. Rodent control operations included the treatment of 12,336,172 acres of infested lands for the control of field rodents and the treatment of 377,499 premises to control common house rats.

The operation of the combined projects involved the expenditure of \$845,908 from Service funds, \$579,885 from cooperating States, and \$1,302,554 from cooperating counties, livestock grower and farmer associations, and others. The Service's Supply Depot at Pocatello, Idaho, prepared and distributed 647,655 pounds of rodent bait materials to cooperators and processed other supplies and equipment.

Control operations were not conducted without many difficulties inherent in wartime conditions. There was a dearth of trained predatory animal hunters and rodent control workers, and a shortage of automotive and other equipment in face of the fact that increasing predator and rodent populations demanded greater, rather than diminished, control efforts. The Service continued to cooperate with the Army and Navy on numerous military reservations in the control of rats and field rodents to protect food supplies and to alleviate the threat of rodent-borne diseases.

LOSSES REDUCED THROUGH ORGANIZED CONTROL WORK

Where predatory animal and rodent control work has been intensively prosecuted, substantial benefits have accrued.

For example, one hunter in Presidio County, Tex., held losses among 40,000 sheep and goats to 11 sheep killed by coyotes. Another hunter in the same county kept losses among 11,000 sheep down to 35 killed

during the year. Crane County, Tex., ranchers report that predator control has made possible an 80 percent, instead of a 40 percent, lamb crop.

While the foregoing examples are typical of many areas, the general predator problem is definitely more acute. This is reflected by the fact that although a yearly take of 100 predators by an individual hunter was considered excellent work a few years ago, today many hunters are destroying predators at the rate of 400 to 600 or more annually.

Previous to control work in Flathead County, Mont., the loss to wheat, oat, barley, and truck crops amounted to 3 percent annually because of ground squirrel depredations. On a monetary basis, this loss exceeded \$54,000. Organized control during the past 5 years, costing \$6,200, effected a net saving in crops of approximately \$48,600. In Ravalli County, Mont., where sugar beet, pea, and truck crops were involved, the returns from ground squirrel control were \$10 for each \$1 expended. The Mayor of Marshfield, Oreg., reports that at least \$25,000 worth of food and other merchandise has been saved during the year because of organized cooperative rat control.

POST-WAR ASPECTS

Post-war control of injurious mammals will be greatly aided by the existence of our field organization—kept going as efficiently as possible during the war—through which expansion of projects may be facilitated. Greater effort must be applied after the war to regain control of predator and rodent populations that have locally increased rapidly in numbers. The upswing of predatory animal populations began at the onset of the financial depression when low fur prices removed the incentive for private trappers to take predators for their pelt values. The situation was aggravated because at that time, when accelerated organized control effort was needed to fill the gap, Federal and cooperative appropriations for the purpose were decreased. The effects of subsequent advances in fur prices, which ordinarily would have stimulated predator control, were neutralized because private trappers began to find more remunerative employment in defense and war industries or entered the military forces. These factors have operated to remove an important check on predators, the numbers of which have continued to increase alarmingly. The manpower shortage has also served greatly to curtail organized rodent control operations and thus has permitted rodent pests to continue their upward population trends. Livestock, crop, and foodstuff damage by predators and rodents has also increased proportionately. As manpower and equipment again become available, expansion of sorely needed mammal control can be realized.

The urgency of rodent and predator control to protect vital food resources has occupied a prominent part in the thinking of more and more people during the period of war. The impression thus left will serve to stimulate cooperative measures to protect and conserve vital food resources in times of peace, which will be needed to rehabilitate our own and the war-torn nations. The widespread interest in rat control, especially stimulated during the war to curtail food loss and to protect human health, will increase in the post-war era.

WILDLIFE CONSERVATION LAWS AND REGULATIONS

Realizing that an increased demand for hunting opportunities will immediately follow the war, the Service is administering the Federal conservation laws and regulations to assure an adequate supply of wildlife at that time. These laws include the: (1) Migratory Bird Treaty Act, (2) Lacey Act, (3) Migratory Bird Conservation Act, (4) Migratory Bird Hunting Stamp Act, (5) law protecting wildlife and property on Federal refuges, (6) Black Bass Law, (7) Bald Eagle Act, and (8) the Alaska Game Law.

The 60-odd United States game management agents, working singly or in cooperation with State officers and United States deputy game wardens, obtained 1,985 convictions during the past fiscal year. With an expenditure of only \$15.75 by game management agents, 3 persons were convicted of serious violations and fined \$700. In addition, the agents worked with farmers in controlling migratory birds threatening damage to agricultural crops and detected and reported to the proper Federal authorities suspicious characters and acts inimical to the welfare of the Nation.

Importation permits issued and the number of animals and birds imported increased as the submarine menace eased. The greatest increase was in monkeys, used largely in medical research laboratories; 7,728 arrived compared to 3,675 the previous year. Mongooses are prohibited by law from entry, but 2 were brought in without permits. One was discovered in New York, the other in Philadelphia. Both were asphyxiated and their skins preserved for science.

Approximately 40 percent of the enforcement agents in the Territory of Alaska have entered the armed forces, but, by making a few replacements and by the increased use of airplanes, it was possible to obtain fairly satisfactory results. Valuable assistance was furnished the armed forces and Federal Bureau of Investigation by enforcement agents. The problems of wildlife protection in the Territory increased in proportion to the influx of men of the armed forces and war workers. The problems were largely solved by arrests, speedy convictions, and cooperation on the part of the military authorities and of project superintendents.

NATIONAL WILDLIFE REFUGES

In general, the refuges enjoyed satisfactory water conditions, the nesting season was successful, and the production of wildlife food was favorable. The refuges also contributed materially to the war program through the production of food, furs, and other essentials.

In 1943, livestock grazing to the extent of 279,358 animal months' use was provided and 15,836 tons of hay were harvested; the cultivation of 21,173 acres of refuge land by private individuals and refuge personnel produced 456,887 bushels of grain and other crops. These represent increases amounting to 177 percent for cattle grazing, 161 percent for hay production, and 182 percent for cereal crops as compared with 1940. These increases were due, first, to the fact that while most refuges were not in full production in 1940, subsequent proper management has increased utilization possibilities; and second, to operations in accordance with the Department's policy to make available in the war program all possible resources of the Department.

The restoration of drained marsh areas has served to increase substantially not only the numbers of waterfowl but also of fur animals, the pelts of which are of great value in outfitting troops in northern climates. Approximately a million fur animals have been taken on the National wildlife refuges between 1936 and 1944. During the 1943-44 trapping season, a total of 185,130 fur animals was taken or 148 percent of the 1940-41 catch.

An increased use of wood products was permitted during the year. As much pulpwood, posts, ties, firewood, and lumber was removed as practicable without adversely affecting the primary purposes of the areas.

Where circumstances permitted, refuge waters were managed for fish production. Consequently, more use was made of their fishing waters than ever before. Recreational fishing totaled 149,941 man-days and resulted in the taking of 760,511 fishes. An additional 964,432 pounds of rough fishes were removed by commercial fishermen.

The total revenue from economic uses on National wildlife refuges including the disposition of big game animals, fur animals, and surplus products was \$244,700, which was deposited in the Treasury.

The occupation of the Netherlands West Indies by the enemy stopped the importation of kapok. In the hunt for a substitute, the fully ripened seed heads of cattails appeared to be the best for use in life preservers, sleeping bags, mats, and pads. National wildlife refuges proved to be among the best sources for this cattail fluff. The 70,000-acre Mud Lake National Wildlife Refuge in northwestern Minnesota was opened to the local residents for harvesting this crop, their income from the fluff amounting to \$34,050.

The population of migratory waterfowl, estimated during the spring of 1944 as 125,350,000 birds, was probably the greatest since the early 1920's. At least a fifth of these birds was reported using the National wildlife refuges. Populations of upland game birds and animals on these areas have also increased favorably. Hunting possibilities on lands adjacent to the refuges as well as on managed hunting units have been benefited. On certain refuges, surpluses have been used for restocking public lands with low game populations.

Fire protection on the forest, grass, and marshlands of the national wildlife refuges continued a major objective. This phase of refuge administration is particularly important not only to protect refuge resources from fire but to prevent the spread of fires to adjacent forest and grazing lands. Funds amounting to \$30,000 were provided during the year under the appropriation "Fire Protection of Forests, Forest Industries, and Strategic Facilities (National Defense)" for the purchase of additional fire-fighting equipment and the employment of lookouts, patrols, and standby crews to augment fire prevention and fire suppression on nine timber-producing refuges located within 300 miles of the coasts.

Lands aggregating 1,845,000 acres were made available on 35 national wildlife refuges within the United States for Army and Navy use as bombing ranges, artillery ranges, aerial gunnery ranges, training grounds, air bases, tank maneuvering areas, docking facilities, and as sites for chemical war munition plants.

The following areas were established as national wildlife refuges during the year: Box Butte, a reservoir of 2,210 acres in Dawes County, Nebr., part of the Mirage Flats Reclamation project, for the protection of migratory waterfowl (Public Land Order, October 30, 1943); Mesilla, an area of 500 acres in Dona Ana County, N. Mex., and El Paso County, Tex., as a resting area for migratory waterfowl (Public Land Order, April 6, 1944); Monomoy, a 3,000-acre peninsula located on Cape Cod in Barnstable County, Mass., one of the finest wintering concentration areas for waterfowl along the New England Coast; Santa Ana, consisting of 1,886 acres in Hidalgo County, Tex., acquired on September 1, 1943, the best remaining habitat on the American side of the Rio Grande for the chachalaca, white-winged dove, white-fronted pigeon, and red-billed pigeon—it will provide a refuge also for black-bellied tree ducks.

LAND ACQUISITION

The Division of Land's activities have been directed to the acquisition of those new refuges and additions to old ones where the emphasis is uppermost on post-war developments. Plans have been formulated for expansion of the work immediately upon the termination of the

war. The Division, as in the preceding war years, has delegated a very substantial part of its manpower to aiding the Navy Department in land acquisition.

WILDLIFE RESEARCH

The wildlife research program has been planned and conducted on the principle that constructive vision and foresight are essential to getting needed information and in making it available for current wildlife management programs and post-war plans. In recognition that the wildlife resources of the continent will be called upon to make an important contribution to the rehabilitation of the American citizenry and soldiers, the scientific staff has been reorganized to economize on time and cost so that the utmost could be accomplished in meeting present needs and in laying a sound foundation of biological facts for post-war programs. Cooperative efforts were enlarged with other Federal, State, and local agencies. These have included public-land management agencies, as the Forest, Park, Indian, and Grazing services and those concerned with flood control, navigation, power development, and reclamation. Extensive studies have been made to develop new poison products and methods of application in rodent-control operations and to devise improved methods of using available supplies of toxic agents heretofore commonly employed but largely cut off by war conditions. Marked progress has been made in these fields and also in the use of deterrents and frightening devices through investigations by our research laboratories and through cooperation with the Office of Scientific Research and Development of the National Research Council and with Federal, State, and local health agencies, including those of the Army and the Navy.

Looking to post-war construction and development work, there is the greatest need for effective coordination among the various land-use agencies, particularly the Corps of Engineers of the United States Army, the Reclamation Service, and the Tennessee Valley Authority. Huge impoundments are being blueprinted by these agencies and plans for wildlife development on these reservations are being made at the same time with a view to increasing their productivity for wildlife. Studies have revealed in some instances that a few minor modifications in plans will provide means whereby water can be effectively controlled for maximum production of wildlife food and habitat requirements.

Work and recreation out-of-doors appeal to a great many people. This Service is receiving many requests from military personnel and veterans who are now making plans for after the war. They are interested in such vocations as hunting, fishing, trapping fur animals, raising fur animals and game in captivity, and growing rabbits for

food and fur. These enterprises require no heavy work and are admirably suited for those who prefer the out-of-doors or can do only light inside work.

Blind people in increasing numbers are finding rabbit raising both profitable and practicable, and the Library of Congress has received requests frequently for literature on the subject in braille. Permission to transcribe Conservation Bulletin 25, "Rabbit Raising," into braille in order that information on the production of domestic rabbits for food and fur may be made available to the adult blind, was requested of the Service by the Library of Congress.

A book entitled, "What is Farming?" has been prepared for the United States Armed Forces Institute and this Service has contributed material and illustrations for the chapter, "Unusual Kinds of Farming." This includes information on fur animal and game farming, rabbit raising, and fish propagation. It is written at high school level and is intended to serve as an orientation course in agriculture. The book will be used by men in the armed services who have an interest in agriculture. More intensive courses in these subjects also are being provided.

After the last war, veterans were encouraged to invest their money in get-rich-quick schemes in the production of fur animals, including rabbits. To avoid a recurrence of this evil, the Service is cooperating with the War Department and the Veterans' Administration to inform military personnel and veterans accurately in order to prevent their being exploited by unscrupulous persons. Material calling attention to the danger of exploitation by high-pressure promoters has been included in the books, *What is Farming?* and *Managing a Farm*, which will be distributed by the United States Armed Forces Institute to military personnel.

Post-war plans for rehabilitating fur farming have been discussed at numerous wartime agricultural conferences for fur farmers. This Service has taken an active part in this post-war planning and will put forth every effort to restore fur farming during the period of readjustment. This activity is an important part of our agricultural development and fits in well with conventional farming.

All the help that we can give will be provided for the returning servicemen and others who wish to engage in fur farming, rabbit raising, trapping, and all the other pursuits in the field of fur resources. Enormous demands for development of this natural asset that have been put aside during the war await satisfaction. A great effort will be made to prevent pressure groups from exploiting any individual who is desirous of rehabilitating himself through business endeavor in the wildlife field.

FEDERAL AID IN WILDLIFE RESTORATION

Despite the war and a further reduction in appropriation, the Federal Aid in Wildlife Restoration program continued to operate effectively during the year.

The cooperating States emphasized particularly the purchase of lands of little agricultural value to provide a basis for post-war development projects. The International Association of Game, Fish, and Conservation Commissioners also has urged the State fish and game departments to plan projects of a developmental nature for post-war attention. The Association was actuated to a considerable extent by the fact that on July 1, 1943, the special Federal Aid in Wildlife Restoration fund contained \$9,441,557, representing the excess of collections over appropriations since 1938. Anticipating liberal appropriation of this accumulated money during the post-war period, the States desire to have ready ample plans so that construction and other restoration measures can be started with the minimum of delay.

Wildlife, including fishlife, is an important feature of outdoor recreation which has always played a prominent part in the American way of life. It is primarily responsible for luring thousands of people outdoors to our National parks and forests, and to the fields and streams. After the present conflict, Americans will require even greater wildlife resources for public enjoyment. In addition to their value in maintaining public health by inducing recreational activities, our abundant wildlife resources normally comprise a basic source of raw materials as fur, meat, and other industrial products, and in time of war they have developed even greater value.

Office of The Coordinator of Fisheries

IRA N. GABRIELSON, Deputy Coordinator

THE United States fisheries are in a condition more nearly approaching normal than at any time since the war began. The fleet, which lost some 700 of its finest craft through requisitioning for military service, is being restored to a size comparable with its pre-war strength. Not only is the fleet nearing its normal size, but it has been kept in good repair and will soon consist of a larger proportion of new vessels than ever before. Nets of practically all kinds are available in adequate supply and shortages of the best types of cordage for marine use are being met in reasonably satisfactory fashion by substitution. On the other hand, severe shortages of manpower persist in some sections of the industry. In the field of marketing and distribution, refrigeration facilities and storage space are generally insufficient and transportation is inadequate to the demands at certain seasons and in some localities. These remaining difficulties, however, are chiefly of a kind that affect the full and efficient utilization of the catch. The basic machinery of production has been restored to good order and the condition of the fishery resource itself is sound.

The improved condition of the fishing industry is reflected in the statistics of production. The total yield in 1943 was 4 billion pounds, a substantial gain over the 3,700,000,000 pounds landed in 1942 and approximately equivalent to the catch of the pre-war year 1940, when production totaled 4,059,524,000 pounds.

The upward trend begun in 1943 has continued into 1944. Total production in the major fisheries made encouraging increases in the first 6 months of 1944 as compared with the previous year, although catches of a few important species are somewhat smaller than last year.

Especially encouraging is the gain in the New England vessel fish-

eries, which last year operated under a severe handicap because of the loss of many medium and large trawlers taken for military service. With the entrance of new vessels into the fishery and the return of a number of these boats to active fishing, landings gained 16 percent during the first half of 1944, compared with the same period last year.

In 1944 the important tuna fishery of the Pacific coast, which ranks fourth in productiveness among all fisheries of the United States and Alaska, is showing a gain of 50 percent in its landings. The pack of Maine sardines has increased 54 percent over the first 6 months of 1943, which will aid in supplying war-increased demands for canned fish. The Pacific mackerel fishery, on the other hand, again shows a reduction in its catch, but this industry is one that is normally subject to great fluctuations of yield, and the decline probably is not entirely due to war conditions. Similarly, the production of shrimp during the first half of 1944 has been disappointing, but the small catch has been due in large part to a scarcity of shrimp on the fishing grounds. A noticeable increase in the catch began during June, however, and with the months of heaviest landings still ahead, the year's production of shrimp may make a better showing.

Viewing the fisheries as a whole, a survey of production made by the Coordinator's Office at the end of June 1944, showed that the smaller catches in certain fisheries, compared with last year, have been more than offset by gains in others. The catch during the first half of the year normally amounts to only a fourth of the year's total, so it is too early to forecast with assurance the total production for 1944. It is believed, however, that it may reach 4,300,000,000 pounds.

This improvement in the condition of the fisheries has been brought about by unceasing effort and close cooperation on the part of industry and Government. When the Office of the Coordinator of Fisheries was established in July 1942, the fisheries of the Nation were in a serious condition of disorganization. The story of the effect of war on the fisheries has been told in many places, and need be only briefly summarized here.

The immediate loss of a large part of its most effective machinery of production crippled important segments of the industry at the outset of the war. The vessels requisitioned for the Army and Navy were, for obvious reasons, the largest and fastest boats in the fleet. The catching capacity of the pilchard fleet, which normally supplies a fourth of all fish caught in the United States and Alaska, was reduced materially. The Alaska salmon fishery lost the greater part of its floating equipment. In New England, the number of large trawlers was reduced one-half. On a somewhat lesser scale, the same condition prevailed in most important fisheries employing boats of any considerable size.

Security regulations placed restrictions on the movements of fishing boats, excluded enemy aliens from fishing crews, and reserved many formerly important fishing areas as mine fields or for target practice.

Repairs to vessels and engines were difficult to secure in busy shipyards, even when the necessary materials could be obtained. Netting was needed by the Army and Navy for camouflage, and supplies of manila, the cordage best adapted to marine operations, were shut off when the Japanese occupied the Philippines. In addition to these difficulties with operating equipment, an estimated one-fourth of the men who normally earn their living directly in the fisheries had either entered the armed services or had abandoned fishing to engage in other industries.

Confronted with this situation, the Coordinator's Office undertook as its first and most urgent task the restoration of vessels and other instruments of production to the fisheries. At the same time it gave its attention to the matter of reconciling the various security regulations and obtaining amendments or relaxations where possible so that the industry might have greater freedom of operation.

BUILDING UP THE DEPLETED FISHING FLEET

The Coordinator's Office immediately began negotiations through the War Shipping Administration to arrange for the return of vessels requisitioned for military service as soon as circumstances should permit their release. In some instances, a large number of boats had been taken as a precaution against emergencies which, fortunately, never materialized. This was true of the Alaska salmon fishery. Representatives of the Coordinator's Office were therefore able to arrange for the return of most essential vessels, cannery tenders, and boats to this industry before the opening of the 1943 season. Construction of new boats for specific military purposes gradually supplied the needs of the Army and Navy and in many instances the Coordinator's Office has been able to demonstrate that the requisitioned fishing vessels would be of greater service to the nation if returned to active fishing.

The total returns of requisitioned fishing vessels now amount, it is estimated, to about 40 percent of those originally taken. These include, in addition to the floating equipment of the salmon fishery mentioned above, vessels returned to the Pacific pilchard fishery, the New England vessel fisheries, the Atlantic coast menhaden fishery, and the sponge fishery. Additional craft probably will be returned in the near future because of the volume of new construction for the military services; some fishing vessels, however, will necessarily continue in active military service until the end of the war.

Much larger additions to the fishing fleet are being made through new construction. The role of the Coordinator's office in this program has been to allot controlled materials through the War Food Admin-

istration, approve authorized production schedules, and grant preference ratings to applicants who wish to construct vessels. During the period from May 13, 1943, to July 1, 1944, the Coordinator authorized the construction of 1,010 new fishing vessels. Of these, 661 were scheduled for completion by July 1, 1944; the balance during the second half of 1944 or sometime in 1945.

Construction needed merely as normal replacements for vessels lost at sea or worn out during the year is estimated at about 275 boats annually. However, the mounting volume of new vessel construction is such that, coupled with the return of requisitioned boats, it is considered that the fleet will shortly be restored to approximately its pre-war size, although shortages may remain in certain fisheries.

SECURING MATERIALS FOR REPAIR AND OPERATION

In addition to facilitating the construction of new vessels, the Coordinator's Office has sought to keep the existing fleet and shore processing facilities in good operating condition by providing materials for repairs and replacements.

During the period from April 1, 1943, to June 30, 1944, applications for more than \$1,185,000 worth of controlled materials and products destined for use in fishing vessels, engines, and shore processing plants were approved by the War Production Board on the Coordinator's recommendation. Applications for controlled materials included more than 11,670 tons of carbon steel, alloy steel, and copper and aluminum products for use in the construction of vessels and engines. Manufactured items for which priorities are required totaled more than \$4,428,000 worth of equipment including various types of engines, machines, refrigeration equipment, and canning machinery. The total number of individual transactions involved in the granting of priority assistance amounts to 891 for the period from April 1, 1943, to June 30, 1944, exclusive of vessels and marine engines.

By acting as a direct claimant in securing allocations of fish nets, twine, and cordage for the domestic fisheries, the Coordinator's Office has been successful in averting any serious shortage of netting with consequent interruption of production. Military needs for camouflage netting, which required a large percentage of the output of the fish net manufacturing industry until late in 1943, were satisfied by that time and the military contracts were cancelled. However, heavy demands for lend-lease and other foreign shipment remain and the normal flow of nets from the manufacturers to the distributors and users cannot yet be resumed. Vigilance and careful assessment of these various demands are still necessary to insure an adequate supply of netting for our domestic fisheries.

FISHERY MANPOWER

Maintaining production in the fisheries requires the maintenance of personnel for producing the catch and processing it for distribution and consumption. Like all other industries, the fisheries have lost many able and skilled young men to the armed services and the war industries. The problem of the Coordinator of Fisheries has been the extremely difficult one of attempting to protect fishery labor that is essential to production, of permitting the drafting of fishermen and processors who are less essential or less productive, and of assisting in recruiting replacements for the unavoidable manpower losses. This task has required the harmonizing and coordinating of the policies of the various Governmental agencies concerned with military and industrial manpower.

During the earlier part of the war the Coordinator's Office was moderately successful in obtaining deferment for men of all age groups who were felt to be essential to the effective prosecution of the fisheries. More recently, however, with a change in the policy of the Selective Service System regarding the deferment of men under 26, the fisheries have lost many highly skilled men for whom no satisfactory replacements can be found. In some localities, fishing vessels are tied up for lack of captains or crews. Without additional men to operate them, a number of the vessels recently built or returned from military service may remain inactive.

In addition to attempting to secure the deferment of essential men, the Coordinator's Office has considered various methods of recruitment, and in cooperation with other agencies has applied the most promising. Neither the use of prisoners of war nor the importation of foreign labor has proved practicable on a large scale. Some of the field representatives of the Coordinator's Office have been successful in programs of direct recruitment of fishermen. On the Coordinator's recommendation, the War Manpower Commission, through its local offices, has conducted manpower surveys for the fisheries and in some instances has undertaken active recruitment campaigns. Improved facilities have been obtained here and there for transporting cannery and other workers from outlying towns to ports of landing where fish are processed. These activities have helped in some measure to alleviate the situation, but a critical shortage of manpower persists in some fisheries. This situation is undoubtedly the most important obstacle to maximum fishery production.

SPECIAL PROGRAMS OF OPERATION

The role of the Coordinator's office has for the most part been confined to placing in the industry's hands the instruments of production and removing, insofar as it was possible to do so, restrictions and

hindrances to their effective use. In a few instances, however, it has proved necessary to exercise additional authority derived from the various Executive orders based on the Second War Powers Act, and to assume the broader powers of actual cooperative management of the Alaska, and later of the Puget Sound, salmon fisheries and the Pacific pilchard fishery.

SALMON CONCENTRATION PROGRAMS

The concentration program for the Alaska salmon fishery, which was inaugurated in 1943 and repeated at the request of the industry in 1944, was made necessary by the unusual situation in which the industry found itself at the close of the 1942 season. The loss of its floating equipment has already been described. In addition, it was expected that no more than 50 or 60 percent of the normal supply of labor would be available in 1943. Shipping facilities for transporting labor and canning equipment to Alaska for the comparatively brief fishing season were at a minimum.

To make the best possible use of available supplies and labor, the Secretary of the Interior issued an order concentrating the canning of salmon in 77 of the largest and most modern plants rather than in the 120 previously used. The concentration program was designed to make possible a reduction in manpower requirements by 5,030 persons, in north-bound passenger accommodations by 3,933 persons, in north-bound tonnage by 17,724 tons, in floating equipment by 86 tenders and 50 scows, and in fishing apparatus by 48 traps, 25 purse seiners, and 67,130 fathoms of gill nets. So effectively did the program operate in 1943 that 5,396,509 cases of salmon were packed during the season, an increase of 307,400 cases over the previous season.

With labor and transportation difficulties somewhat eased in advance of the 1944 season, it was possible to make certain relaxations in the program for this year, although it continues the essential features of the original concentration order. Continuation of the concentration plan after 1944 will be dependent on conditions and on the sentiment of the industry.

The success of the Alaska salmon concentration program in 1943 so impressed the salmon industry generally that the operators of the 11 canneries in the Puget Sound area petitioned the Coordinator of Fisheries to establish a similar program for that branch of the industry. Accordingly, a program was outlined in consultation with representatives of the industry. Under this program, 9 firms are operating jointly in the largest and most efficient cannery of the area, 2 plants are operating independently, and a smaller cannery has been designated a standby plant for use in case of emergency. The plan represents a saving of 525 cannery workers and 27 tenders and fishing

boats, which are thus released for use in other fisheries, and a considerable saving in fuel oil and critical repair and other maintenance material. A concentration program is particularly desirable in Puget Sound during the 1944 season, which is one of the "off years" in which relatively small runs of salmon are to be expected. In 1945, however, heavier runs should occur, and the desirability of modifying or abandoning the program will be given due consideration before the season opens.

PILCHARD PRODUCTION PLAN

Because of the heavy volume of its normal production, and also because of the great importance of its products to the war program, the effective operation of the Pacific pilchard fishery is a matter of national importance. Landings of pilchards normally amount to about one billion pounds annually, or a fourth of all the products of the fisheries of the United States and Alaska. Out of this catch, three to five million cases of canned pilchards or California sardines are packed, and over 14 million gallons of oil and 75,000 tons of meal are processed. Since 1941, the Government has requisitioned over half the canned pack each year for military and lend-lease requirements.

In an effort to secure maximum production and effective utilization of the catch, some degree of control over the pilchard fishery was instituted by the War Production Board in 1942. This control was not effective in accomplishing the desired results, however, and after the delegation of authority in this field to the Office of the Coordinator of Fisheries, the industry requested the issuance of new Government controls which would meet the requirements of the situation. In the early months of 1943 conferences were held with industry consultants, and mass meetings of fishermen, boat owners, and cannery and reduction plant operators were held in several cities in California. A plan was evolved which met the approval of the industry and was accordingly adopted. It provided for distributing the fishing activity and catch on the basis of (1) the Government requirements for canned sardines and sardine meal and oil; (2) the necessity of maintaining an even flow of raw material into the various ports and plants to insure that the equipment and manpower would be available at all times for processing the catch; and (3) the condition of fishing in the waters adjacent to each port.

In general, the Coordinated Pilchard Production Plan was well received and generally successful during the operating season of 1943-44. Aside from minor administrative difficulties, the chief difficulty was to maintain a fleet of sufficient size to supply canneries and reduction plants in the San Francisco area. This condition was aggravated by poor runs of fish and interruptions of fishing by unfavor-

able weather. The season's production in California as a whole was 473,450 tons, a decline of 9 percent from the previous 5-year average. Owing primarily to the shortage of cannery labor, the production of canned sardines declined materially, being 11 percent less than the 5-year average. However, a thorough analysis of the situation indicates that the pack would have suffered a further decline had no production program been in operation.

The industry was consulted at the close of the season as to the desirability of continuing the production program. The consensus favored a repetition of the program with minor improvements and provision for stricter enforcement during the 1944-45 season.

FISHERIES IN SOUND CONDITION FOR POST-WAR DEVELOPMENT

In spite of the heavy demand for the products of the fisheries and the difficulties under which the industry has operated, the fundamental condition of the resource is sound. As a result of the temporary reduction in the size of the fishing fleet, the intensity of fishing has declined in many areas and, as a result, signs of a relative increase in the abundance of many important commercial species have been noted. In carrying out the war program for increased production, the responsibility of preserving the Nation's basic fishery resources for future use has not been forgotten. Conservation regulations have been amended in only a few instances, when mature consideration indicated that such action would not endanger the stability of the resource. The wisdom of this policy is now apparent.

The Office of the Coordinator of Fisheries is a war-time agency, and as such has no permanent existence and no post-war program. Plans for the future development and expansion of the fisheries belong, rather, to the Fish and Wildlife Service and the individual States. The Coordinator's Office derives satisfaction, however, from its conviction that when its task is completed and the present controls over the fisheries are relinquished, the living resources on which they depend will be found in sound condition, unimpaired by the strains and demands of war.

National Park Service

NEWTON B. DRURY, Director

AS THE Nation approaches the decisive phases of total war, it is gratifying to report that the national parks as an institution have thus far stood intact. There is now reason to believe that they will emerge with their essential qualities and the pattern of their management relatively unimpaired, for even under the stress of national emergency general recognition has been given to the importance of protecting, in war as in peace, those portions of the Federal Estate which, because of significant features of beauty and interest, have been set aside to be held unchanged as part of the American heritage.

Recent annual reports have outlined the challenge that faced the Service in meeting the emergencies and making the contributions involved in World War II, at the same time giving protection to scenic, scientific, and historic aspects of the National Park System. Those reports explained the course pursued by the National Park Service, with the firm support of the Secretary of the Interior, in cooperating with war agencies without departing from the obligation of its stewardship.

After some 3 years of participation in the war program, involving more than 1,000 authorizations for uses of park lands and facilities, an appraisal of the status of the parks produces some interesting and reassuring facts. Although it is still too early to report definitely upon the effects of all park uses by military and other war agencies, a recent survey indicates that, although such uses have been much more numerous than expected, relatively little permanent impairment of park features has resulted, largely because of the cooperative, open-minded approach of the war agencies to each problem.

THREATS TO PARK CONSERVATION AVERTED

It has been fortunate that no desperate situation demanding destruction of major park features has arisen; and developments of the past year proved the wisdom of not yielding to pressure without

a reasonable showing of critical necessity. Park timber, urgently demanded on the ground of war needs, upon investigation was found not to be essential to victory, as alternatives proved to be available; invasion of California parks by cattle and sheep proved not to be essential to the public welfare and was found to be of negligible importance to the meat industry; an initial venture in removing strategic mineral ore from a national park was abandoned as uneconomical. Thus scenic, scientific, and cultural resources of the national parks, that would have been disastrously affected or even entirely destroyed had free rein been given to all agencies and industries demanding their use in the name of winning the war, are still held as a part of the Nation's treasure.

Sitka spruce.—Pressure for the logging of Sitka spruce in Olympic National Park was intensified at the beginning of the year. Anticipation of a shortage of this species for aircraft lumber to meet war needs in the spring and early summer had led to a request from the War Production Board for the release of the park spruce.

Although some of the lumber manufacturers were insistent, the Secretary of the Interior refused to act without satisfactory proof that the necessary aircraft spruce could not be obtained from other sources. While negotiations between the Department and the War Production Board were pending, the situation changed by reason of the Alaska Spruce Log Program of the United States Forest Service, greatly increased spruce production in British Columbia, increased production of aluminum available for plane manufacture, and the Army's cancelation of orders for certain types of wooden planes. The War Production Board thereupon withdrew its request.

Thus the threat of invasion of Olympic National Park by logging was safely outridden. Nevertheless, constant vigilance is necessary, since in some measure the drive was directed to the use of park forests to sustain private industries after the war.

Spruce and hemlock in Great Smokies.—War needs for wood pulp of the long-fibered type early in the spring of 1944 loomed as a threat to the remnant of virgin red spruce and hemlock in Great Smoky Mountains National Park.

Availability of these species in the park was investigated by representatives of the Paper Division of the War Production Board, the School of Forestry of North Carolina State College, and a local lumber company having nearby an idle pulp mill equipped to process these woods.

Fortunately, it was ascertained that numerous other species are available for the manufacture of long-fibered paper products and that many other mills are manufacturing long-fibered pulp.

Strategic minerals.—The apparent necessity of relieving the critical shortage of strategic minerals resulted in an exception to national park

policy in 1943. Mining of a deposit of tungsten in Yosemite National Park by the Metals Reserve Co., a Federal agency, was permitted upon recommendations of the Geological Survey, Bureau of Mines, and War Production Board. The company ceased operations in the fall of 1943, with approximately 55 tons of hard-sorted ore obtained, and permit therefor was revoked by the Secretary of the Interior as of December 27, 1943.

The Defense Plant Corporation, whose permit to extract salt from Death Valley National Monument as an emergency measure in connection with nearby magnesium production expired December 31, 1942, completed restoration work in the Badwater salt area of the monument in December 1943.

Grazing.—Remembering the experiences of World War I, when grazing was permitted as an emergency measure, the National Park Service during the present struggle definitely excluded livestock from the wilderness national parks. Its studies had revealed that the carrying capacity of all the national parks in the one State of California, where grazing was demanded by the cattlemen, would not exceed 6,000 cattle—less than one-half of 1 percent of that State's approximately 1,400,000 beef cattle—and that this slight contribution to the meat supply would entail heavy damage to park features.

Drought conditions in the spring of 1944 caused livestock growers in the interior valleys to renew efforts to secure grazing privileges in the Sierra Nevada national parks. With greater than normal cattle inventories, range conditions were about 50 percent of normal in early April and dry feeds were exceedingly short. Therefore, after conferences with representatives of livestock associations, war food administrators, and others, the Service recommended to the Secretary that he consider limited grazing in some national park areas in California as a wartime emergency if it were shown that such steps were necessary to save purebred breeding stock from starvation. The Secretary agreed to consider each case on its merits.

To investigate the need of such action, a grazing committee was established, including representatives of the Sierra Club, California Conservation Council, Western Federation of Outdoor Clubs, and United States Forest Service. After a thorough study of the situation, and after consultation with Government agencies charged with control of the wartime food supply, this committee reached the unanimous conclusion that to June 30 opening of national park lands to grazing was "not justified by manifest war necessity—nor is the purebred breeding stock of the herds for which applications have been submitted likely to be lost if park range is not made available." Expressing sympathy and understanding of the situation in which the applicants found themselves through their efforts to produce more meat, the committee nevertheless stated that it "would feel itself

hard-pressed to recommend to the Secretary that a natural resource within a park, such as its grasslands, should be utilized for what amounts to the economical stabilizing of a private operation on the outside."

In closing its report, the grazing committee stated that "if and as applications are submitted which fall clearly within the spirit of the Secretary's intent, the committee will recommend their approval."

Meanwhile, a bill (H. R. 5058) has been introduced in Congress by Representative Clair Engle to open all national parks and national monuments to livestock grazing for the duration of the war and six months thereafter.

HISTORIC OBJECTS THREATENED

Necessity for the salvaging of metals led to the suggestion that the historic cannon, monuments, and markers in the national military parks be melted down as an aid to the scrap drive. This was a real threat for a time, but was fortunately averted. The Service gathered in its areas over 8,500,000 pounds of scrap metal, but as to trophy ordnance and memorials raised with the War Production Board the question whether rare and irreplaceable historic relics should be scrapped until the national stockpile of useless and nonhistoric and nonartistic metal objects had been utterly exhausted. The point was made that each war memorial represents the last possible debt payment of the Nation to some soldier or group of soldiers in our national past, and that it would be of little comfort to the soldiers of the present day if such evidences of the Nation's gratitude should come to be lightly regarded.

In this connection, at least one patriotically intended, but impulsive and irrevocable act of salvage serves to give point to the position taken by the Service. The U. S. S. *Oregon*, famous for its spectacularly long and speedy run to participate in the American naval victory at Santiago Harbor in 1898, was withdrawn from active service in 1925 and maintained as a historic shrine by the State of Oregon. In 1942 this battleship was dismantled for scrap metal. Representative Homer D. Angell now doubts that an appreciable amount of salvage from the *Oregon* went into the war effort and has asked for an official investigation. In any case, that which to many citizens was a precious symbol of our freedom has now become a wistful memory, and the question "Was it really necessary?" is a question asked too late.

NATIONAL PARK SERVICE LAND POLICIES CHALLENGED

Partly due to war pressures, and partly because of growing conflicts between utilitarian and conservation concepts, there arose during the past year definite challenges to the land-acquisition policies of the

National Park Service, accompanied by widespread misconception of the Service's functions and purposes. This was the case in the controversy over Jackson Hole National Monument. It was also brought out in the Partial Report of the Senate Committee on Public Lands and Surveys Pursuant to Senate Resolution 241, Seventy-sixth Congress, which contained this statement:

There are certain Government agencies that habitually and regularly include in their withdrawals far larger areas than could possibly be justified after a careful examination of the actual and proper needs. Probably the most flagrant example of this constant overreaching is to be found in the actions of the National Park Service in the setting up of national parks and monuments. There is, apparently, no limit to the demands of that agency for additional areas to administer.

It is sincerely believed that this is a misconception of the attitude of the National Park Service.

Hearings were held during the year by a subcommittee of the Senate Committee on Public Lands and Surveys in various western towns. Administrative officials of the Service were asked to attend these hearings and endeavored to answer this charge. At the hearing in Fredonia, Ariz., the Director said in part:

We are confining our attention to the areas of national caliber which are outstanding in natural beauty, wildlife values, historical and scenic interest, and we can, I agree with you, readily imperil the high standards which we have tried to maintain for the national-park system, if we take in too much territory.

Now the question as to how much land it is reasonable to include in national parks and monuments, is, of course, debatable. The fact is that, of the total land area of the United States, only about three-quarters of 1 percent, at the present time, is included in all the different types of areas administered by the National Park Service. In general, our approach is not to add to this number of areas or acreage, except where there are outstanding examples of scenery and other values such as we are supposed to preserve in parks and monuments, examples that are distinctly of interest to the Nation as a whole * * * That, too, I think we have to do without injustice either to individuals concerned or the communities where these areas are located.

While at these hearings the National Park Service took exception to the charge of "land-grabbing," it has welcomed the opportunity to explain its land policies to members of Congress, to conservationists, to those who wish to use park lands for private commercial gain, and to the public generally, which stands to gain or lose most by any change in park conservation principles and practices since the national park areas are established "for the benefit and enjoyment of the people."

It is believed that an impartial review of the history of the National Park System will verify the statement that the long-range policy guiding its growth has been one of restricting the system to areas superlative in their own fields of scenery, natural science, or history. Em-

phasis has been placed upon quality rather than quantity, and upon national rather than the local significance of the areas acquired.

The Service would welcome an impartial reevaluation of the value of the National Park System in the light of the highest public use of the lands involved, from the standpoint of national interest.

Establishment of national parks by act of Congress began in 1872 with Yellowstone National Park. Up to 1916, when Congress created the National Park Service, 16 national parks, the Hot Springs Reservation, and 56 national monuments and related reservations had been established. Unquestionably, before 1916 a few areas had crept into the National Park System which did not measure up to national standards. No Federal agency existed to investigate the national importance of their scenic, scientific, or historic characteristics. The Service believes that had it been in existence at the turn of the century its stand against inclusion in the system of these substandard areas would have been heeded by Congress.

Since its organization the Service has hoped and planned to relinquish jurisdiction over some such properties. Unfortunately, in many cases this has been impossible. No units of the National Park System, whether established by act of Congress or by Presidential proclamation, may be abolished without authority of Congress. Paradoxical as it may seem in the face of the present Jackson Hole controversy, it is far easier to establish a new area with the approval of Congress than to abolish an existing one. Once a park or monument is established and accepted by the local people, its abolition usually is considered an affront to local pride.

Similarly, when the consolidation of national parks and allied areas under the National Park Service took place in 1933 by Executive order, certain areas were inherited which were not characteristic of the National Park System. Efforts to remove them from the national category and give them State or local park status have in general been met by united local opposition supported by Congressional delegations from the States concerned.

National cemeteries.—Among the areas transferred to National Park Service jurisdiction in 1933 were several national cemeteries within or near national military parks. Recently, the demand for burial space in these cemeteries has increased, giving rise to the question as to whether cemeteries in this group shall be enlarged. The National Park Service has taken the position that existing national cemeteries under its jurisdiction shall not be extended, since such increase would encroach upon the historic area of the national military park with which the cemetery is associated. Moreover:

eration of such enlarged cemeteries would not be a proper function of the Service.

It has been determined that the Chattanooga National Cemetery, Tenn., one of those transferred to the National Park System in 1933, is not located on historic ground and is not adjacent to Chickamauga and Chattanooga National Military Park. It has nearly 14,000 unoccupied grave sites. With the concurrence of the Secretary of War, and approval by the Bureau of the Budget, a draft bill to transfer jurisdiction over this cemetery to the War Department has been prepared for presentation to the Congress. This is typical of the endeavor of the Service to concentrate its activities in the fields primarily covered by the basic act establishing it.

Rejections of park proposals.—From 1933 to 1940 the Service investigated 353 areas proposed for national park, monument, or related purposes. Most of the proposals were disapproved on the ground that the areas under consideration were not of national park caliber. During the same period, 420 additional park proposals were made, but were not investigated or otherwise acted upon, largely because of lack of funds and personnel. Among the areas proposed for national park status which have been adversely reported upon were the scenic and well known Pikes Peak and Mount Baker.

As to the charge that "habitually and regularly" certain Governmental agencies "include in their withdrawals far larger areas than could possibly be justified after a careful examination of the actual and proper needs," the record shows that in wilderness national parks the National Park Service in general has erred in taking too little land, resulting in inadequate range for native wildlife and creating administrative difficulties; and Congress has frequently rectified such park boundaries.

Recreational demonstration areas.—In line with Congressional authority requested by the Department, upon advice of the National Park Service, and granted in 1942, more than half of the 46 "recreational demonstration areas" have been relinquished. Fifteen and part of another have been transferred to the respective States, and 2 others have been approved by the President for such transfer. Nine, and part of 1 other, have been added to the National Park System, primarily to existing park areas. One has been transferred to the Bureau of Reclamation. It is expected that 13 additional demonstration areas will be transferred to their respective States or political subdivisions thereof when these are in a position to administer them. Five are being retained in their present status awaiting determination as to their best disposition.

214 • Report of the Secretary of the Interior

The status of all 46 recreational demonstration areas is shown below:

Recreational demonstration areas, June 30, 1944

Area	State	Acreage	Disposition	Visitors
Acadia	Maine	5,654	Added to Acadia National Park, June 6, 1942.	(1)
Alexander H. Stephens Badlands	Georgia	940		7,300
	South Dakota	43,414	Added to Badlands National Monument by act of June 26, 1936.	(1)
Beach Pond	Rhode Island	3,481	Transferred to State, June 28, 1943	
Bear Brook	New Hampshire	6,436	Transferred to State, May 12, 1943.	
Blue Knob	Pennsylvania	5,136		7,143
Blue Ridge	(North Carolina	10,624	Added to Blue Ridge Parkway, June 30, 1936.	(1)
	Virginia			
Bull Run	do.	1,605	Designated as Manassas National Battlefield Park, June 10, 1939.	(1)
Camden Hills	Maine	4,962		5,495
Catoctin	Maryland	9,919		
Cheraw	South Carolina	6,825	6,619 acres transferred to State, June 9, 1944. 206 acres transferred to Fish and Wildlife Service, May 10, 1944.	
Chopawamsic	Virginia	15,984	Added to National Capital Park System, Aug. 13, 1940.	
Crabtree Creek	North Carolina	4,983	Transferred to State, April 6, 1943	
Culvre River	Missouri	5,759		16,006
Custer	South Dakota	20,405		
Fall Creek Falls	Tennessee	15,777	Transfer to State approved by President, awaiting acceptance.	1,547
French Creek	Pennsylvania	6,198	214 acres established as Hopewell Village National Historic Site, August 3, 1938. Remaining 5,984 acres added to Site, June 6, 1942.	(1)
Hard Labor Creek	Georgia	5,804		21,346
Hickory Run	Pennsylvania	13,386		9,008
Kings Mountain	South Carolina	10,147	3,972 acres added to Kings Mountain National Military Park, July 11, 1940. Remaining 6,175 acres transferred to the State, May 30, 1944.	(1)
Lake Guernsey	Wyoming	1,753	Transferred to Bureau of Reclamation, June 8, 1943.	
Lake Murray	Oklahoma	2,228	Transferred to State, February 20, 1943.	
Lake of the Ozarks	Missouri	16,196		10,522
Laurel Hill	Pennsylvania	4,026		11,331
Mendocino Woodlands	California	5,425		2,567
Montgomery Bell	Tennessee	3,746	Transferred to State, June 9, 1943.	
Montserrat	Missouri	3,441		24,706
Oak Mountain	Alabama	7,805	Transferred to State, Apr. 30, 1943.	
Otter Creek	Kentucky	2,445		4,726
Pere Marquette	Illinois	2,522	Transferred to State, May 7, 1943	
Pine Mountain	Georgia	3,032		3,413
Raccoon Creek	Pennsylvania	5,035		10,590
Roosevelt	North Dakota	66,376		12,450
St. Croix	Minnesota	18,499	Transferred to State, Sept. 27, 1943	
Shelby Forest	Tennessee	12,258	Transfer to State approved by President, awaiting acceptance.	32,950
Shenandoah	Virginia	10,129	Added to Shenandoah National Park, June 6, 1942.	(1)
Silver Creek	Oregon	4,093		3,901
Swift Creek	Virginia	7,605		67,843
Versailles	Indiana	5,371	Transferred to State, Apr. 20, 1943.	
Waysides (6 units)	South Carolina	228	Transferred to State, June 9, 1944.	
Do.	Virginia	206	Transferred to State, Mar. 26, 1943.	
Waterloo	Michigan	11,830	Transferred to State, June 15, 1943.	
Winamac	Indiana	6,233	Transferred to State, Apr. 20, 1943.	
White Sands	New Mexico	1,719	Added to White Sands National Monument, June 6, 1942.	(1)
Yankee Springs	Michigan	4,197	Transferred to State, June 15, 1943.	

¹ Visitors counted in park or monument totals.

Jackson Hole National Monument.—Still pending at the close of the year were the Barrett bill (H. R. 2241) to abolish the Jackson Hole National Monument and the suit of the *State of Wyoming v. Paul R. Franke* (Superintendent of Grand Teton National Park and of Jackson Hole National Monument), the latter to test the legality of the

establishment of the monument by the President on March 15, 1943, under authority of the Antiquities Act of 1906.

Following the hearings on the Barrett bill held in Washington in late May and early June 1943, further hearings were held in the Jackson Hole area the following August. Involved in these hearings were many issues which brought to a focus most of the basic problems of the National Park Service.

Of the area Frederic L. Paxton, distinguished historian of the West who was awarded the Pulitzer Prize for his *History of the American Frontier*, said: "Jackson Hole at the base of the Grand Tetons is not only a great scenic treasure but also an important early center of mountain fur trade and exploration of the far West. It should be preserved as a national monument." Similar opinions by authorities on geology and wildlife support the preservation of the Jackson Hole according to the National Park Service pattern.

That many of the local people are of the same opinion was evidenced by petitions received by the House Committee on Public Lands too late for inclusion in the printed hearings of the committee on the Barrett bill, but published in the *Congressional Record* of June 7, 1944. Approximately 100 "long-time residents of Jackson Hole, Wyo., * * * actively engaged in business here," expressed the belief that "Jackson Hole is one of the finest outdoor recreational areas in the world and * * * it should be protected and developed as such," and that "it is our final conclusion that it is time for us to work constructively together and to put an end to quarreling, and we urge upon our congressional delegation that they transfer their efforts from the present Barrett bill to efforts for constructive legislation that will supplement the monument proclamation, by giving permanence and certainty to the foregoing rights [valid existing claims already recognized by the Department] which, although now guaranteed by the statements of officials of the Interior Department, should be placed beyond any possibility of doubt by legislative action." Another petition, signed by eight prominent businessmen representing commercial interests in the Jackson Hole valued at more than half a million dollars, urged the Committee "not to undo the Jackson Hole National Monument, but, if it needs bettering in any way, that you strengthen and perfect it by legislation."

During the 1944 fiscal year the National Park Service gave the monument such protection against fires and vandalism as could be provided under the limitations of the 1944 Interior Department Appropriation Act, which provided that the Service might undertake only those administrative functions that were in operation on the lands prior to monument establishment. The 1945 Appropriation Act contains the same restriction.

In March 1944 the Public Lands Committee of the House of Representatives made a favorable report on the Barrett Bill to abolish the monument, and in May the Rules Committee of the House took action providing for a vote. The bill, however, to June 30 had not been called up.

Meanwhile, the trial of the *State of Wyoming v. Paul R. Franke* was held on August 21 at Sheridan, Wyo.¹

TRAVEL CONTINUES DESPITE WAR

Despite recurring rumors to the contrary, the national parks of the United States have not been "closed." They have remained open to travel, but on a limited-service basis. The Office of Defense Transportation necessarily tightened restrictions on pleasure-travel, and the National Park Service adhered strictly to the policy enunciated by the Secretary of the Interior of not encouraging visitors to the national parks.

The travel figures are interesting more for the trends indicated than for the totals. Due to the continued trend of diminishing travel, especially through July, August, and September, 1943 (the first months of the 1944 fiscal year), the total number of visitors for the fiscal year decreased to 7,455,271 from the 1943 fiscal year total of 8,193,090, a decline of 737,819 or 9 percent. The downward trend, gradually leveling off during the next 2 months, reached bottom about December 1, 1943, and has since reversed its direction to consistent and accelerating increases. The total of 3,818,766 visitors recorded during that portion of the 1944 fiscal year from December 1, 1943, to June 30, 1944, was an increase of 615,446, or 19.2 percent over the 3,203,320 recorded during the corresponding period of the 1943 fiscal year. An increase of 49 percent was recorded in June 1944 over June 1943.

On the basis of current travel trends, it is estimated that the total number of visitors for the 1944 travel year (October 1943 through September 1944) will equal 40 percent of the peak travel year of 1941 when there were 21,050,426 visitors.

The 2,149,398 military visitors during the 1944 fiscal year made up 29 percent of the total. In all, 4,135,052 men and women in uniform have visited the national parks and allied areas since Pearl Harbor.

Facilities available to visitors.—Park concessioners, as required under their contracts, provided limited service, such as stores, meals, and overnight accommodations, in those areas where the extent of wartime travel indicated a distinct need therefor. In the face of difficult operating conditions, this service to the public was well handled. All Office of Price Administration rules and regulations

¹ The case was taken under advisement and a decision is expected sometime after January 1, 1945.

with respect to meals and housing rate ceilings and the rationing of food and gasoline were strictly applied. No sightseeing trips were operated, practically all hotels were closed, and accommodations were the simplest compatible with the responsibility of providing for the public comfort.

CONCESSION POLICIES

The Department policy that concession facilities wherever possible should be installed and owned by the Government was further crystallized. This policy relates to ownership of the improvements and physical plant by the Government, and is quite distinct from the question of operation. Post-war construction programs were broadened to include plans and estimates for new Government-owned concession facilities in many areas. Concession facilities in 38 areas under National Park Service administration now are owned in whole or in part by the Federal Government.

National Park Concessions, Inc., the nonprofit distributing private corporation organized in 1941 to handle concession operations in facilities acquired through donation in Mammoth Cave National Park, extended its operations to include the concessions at Isle Royale National Park, Rosemary Inn in Olympic National Park, and Vanderbilt Inn in the Vanderbilt Mansion National Historic Site. It also acted in a managerial capacity at Lassen Volcanic National Park for the park concessioner. Its operations on the Blue Ridge Parkway were in abeyance during the year. The Secretary of the Interior designated National Park Concessions, Inc., to operate facilities in Big Bend National Park.

LOOKING INTO THE POST-WAR FUTURE

Past experience and present indications point to a speedy resumption in the early post-war period of the upsurge in national park travel that was interrupted when hostilities began late in 1941. Inherent in this anticipated increase will be diverse problems of protection, development, and use, requiring much thought and planning.

Typical of the most serious pending use-problems are: Control of concentration of visitors, fundamental to the protection of perishable features of certain western parks; possible future removal of concession facilities from areas of the greatest natural beauty; campground and forest encroachment conditions in Yosemite National Park; operation of Crater Lake National Park on a summer basis, avoiding costly snow-removal activities; and possible removal of Mount Rainier National Park headquarters to a more suitable site. Implicit in each of these situations, and many others of like nature, is the responsibility of the National Park Service, under mandate of Congress, to protect the natural features of the parks, while contributing to public enjoyment.

In the older national parks the original lay-out of visitor facilities under then-prevailing slow modes of travel, was based on the need for overnight accommodations within the parks and near points of major interest. In general, this condition no longer prevails. The question, therefore, arises: Should future planning envision only facilities as are necessary for daytime use, depending upon nearby communities to furnish sleeping accommodations as in the case of the Great Smoky Mountains National Park? Needless to say, there will always be certain areas where it would not be practicable to follow this procedure. But a trend away from developments of the resort type within the parks will serve the objective of holding the most valuable features of many areas unimpaired.

Post-war construction.—The National Park Service is not primarily a construction agency, but it stands ready, as part of its continuing program of providing facilities, to take a small, but nonetheless substantial, part in any national post-war public works program. When the Nation went on a war basis, the construction of all physical developments in national park areas was terminated, and there is now a backlog of urgently needed construction.

Studies have been made of the Master Plans, upon which all development is based, to ascertain the maximum amount of construction that could be promptly undertaken in connection with post-war public works financing. A suggested program of planning was prepared involving the expenditure, over a 3-year period, of \$4,750,000 for investigations, surveys, and the preparation of detailed plans, specifications, and estimates. This is essential, as it takes much time and thought to program construction in such manner as to retain the natural beauty of the native landscape. Based on such studies, the Service could have ready for initiation within a reasonable time a construction program involving about \$78,000,000 for parkway, major and minor roads, trails, and physical improvements. Experience indicates that the desirable pace for such construction would be at the rate of about \$22,500,000 per year. More than this might result in hurried and ill-advised construction.

During the 10 years of work relief programs most of the work in National Park Service areas that could be done by unskilled labor with restricted amounts of equipment and materials was accomplished. The bulk of needed future work could best be done under contract with responsible contractors possessing good equipment and experienced foremen and crews.

Studies as basis of park policy.—Post-war planning should include research projects and interpretive undertakings of prime importance in preserving basic park values. Studies of this nature are essential to intelligent administration and vital to the protection of historic and scientific resources. One such problem is to determine the extent

of permanent impairment that may result from development of tourist facilities and heavy use of park areas. There are kindred problems in forestry, wildlife, history, and other fields, regarding which investigations as to basic facts must precede the formulation of policies or the taking of action.

Airplanes.—Recognizing the tremendous impetus given to air travel by war-caused developments in aviation, the Service is looking ahead to its possible effect upon the national parks and has discussed the problem with representatives of the Civil Aeronautics Authority. Commercial and private aircraft will increasingly become a popular mode of transportation to the national parks, and will have to be reckoned with. It is felt, however, as in the case of rail and bus terminals, that airplane landing fields should be located outside park boundaries.

There will be a period of experimentation in this new and highly important field of air travel, and this phase of trial and error should not be allowed to impair the national parks. Experiments with air-transport, helicopter, or private plane should be carried on in other areas. When aircraft construction and use are stabilized, or when conditions change materially, this policy will be reviewed. Meanwhile, it is obvious that the construction of landing fields and auxiliary buildings would intrude upon park scenery; and that the noise and confusion of airplanes would disturb the native wildlife and would tend to destroy the character of these great areas as nature sanctuaries, especially affecting their atmosphere of serenity and peace, wherein lies their value for inspiration, recreation, and relaxation.

COOPERATIVE PLANNING STUDIES

By maintaining a review of the water control plans of various Federal and State agencies, the Service has been able to observe the trends in national water policy and water use developments, and their bearing upon the National Park System or on other park and recreational interests.

Potomac River recreational survey.—At the request of the War Department, the National Park Service made a study of the scenic, recreational, and historic features of that portion of the Potomac drainage basin upstream from Great Falls to the headwaters of the river, and the effect thereon of the proposals for a series of multiple use reservoirs. In putting its investigative facilities at the disposal of the United States Army Engineers the National Park Service in no way supported any plan to dam the Potomac River, which admittedly would adversely affect the environs of the National Capital.

Denison Dam and Reservoir recreational planning project.—This survey was completed and a report was prepared, including plans and recommendations. It recommends acquisition of 9,630 acres of

additional lands to permit establishment of two major recreational developments—one each in Texas and Oklahoma—and six minor developments. The estimated cost for acquisition and development is \$6,000,000.

Other recreational studies.—Recreational planning studies were continued, in cooperation with the Bureau of Reclamation, on the Grand Coulee Dam and Reservoir on the Columbia River, Wash., the Central Valley Reclamation Project in California, covering the Sacramento and San Joaquin watersheds; the Colorado River basin; and the Missouri River basin. There were further studies and research on the suggested Mississippi River parkway, of interest among Mississippi River States.

Alaska Highway study.—Field studies were made during the 1943 summer, of scenic, scientific, historical, and recreational features, and possible roadside developments, along that portion of the Alaska Highway located in the Territory of Alaska, as authorized by the President on January 8, 1943. Further studies are now in progress.

STATE RELATIONS

The Service has continued, but in a more limited way, to assist the States in their park planning and administrative problems. The principal assistance rendered has been the serving as an informal liaison between State park officials and war agencies in connection with the utilization of State parks and recreational areas for purposes relating to the prosecution of the war.

WILDLIFE OVER-POPULATION PROBLEMS

In war or peace, certain problems of protection and administration confront the National Park Service, notably in the fields of wildlife and forestry.

The basic wildlife policy has been one of permitting each species to carry on its struggle for existence without artificial aid, in the belief that this is for the ultimate good of the species, and conforms to the purpose of the parks. If conditions become such that a particular type will perish if not given especial protection, temporary resort may be made to control of natural enemies, artificial feeding, or such other measures as are necessary; directing the entire effort, however, toward placing the species as soon as possible upon a self-sustaining basis. During the past two decades over-population by grazing and browsing species in relation to the available winter range has increased, partly because of earlier artificial protective methods and partly because of growing restriction of once natural range outside these reservations. During the past year definite steps were taken to correct several of the most critical situations.

Yellowstone buffalo management.—This problem has been especially serious in Yellowstone National Park because of the complex pattern presented by the varied herbivorous forms that inhabit the area—deer, antelope, elk, moose, mountain sheep, and buffalo—and the limited winter range available. In considering the buffalo situation three salient points were taken into consideration: (1) The buffalo no longer faces extermination; numbers and distribution in the United States attest to its security as a species. (2) Continuance of the buffalo herd in Yellowstone is considered desirable and justifiable because the animals occurred there naturally, as evidenced by ancient skeletal finds. (3) Reduction of the herd is deemed imperative that Yellowstone National Park may be maintained as a natural area, and not as a zoological park or game farm. Present policy proceeds on the theory that ranch activity is no longer necessary, either for survival of the bison as a species or for the continuance of a normal number of buffaloes in the park.

To restore the buffalo to its normal place in the park fauna and to rehabilitate the range vitally needed by other wildlife species, the Lamar buffalo herd was reduced by 400 animals during the winter.

The ultimate plan for the Yellowstone buffalo herd contemplates a tapering off of feeding and placing the animals entirely upon their own resources. Hay will be kept on hand for several years to insure against potential adverse effects of unusual weather conditions before the herd reestablishes its natural feeding habits; and intensive studies will be made of its behavior under the new program. Future action will be based upon experience and investigation, but always with the ideal of maintaining the buffalo, like other species, as a wild animal in a natural environment, and not as the basis of an "animal show."

Yellowstone elk.—Because of the mild winter, most of the northern elk herd stayed in the park and the comparatively modest reduction planned through hunting north of the park could not be effected. The season closed on March 1, 1944, with a total estimated kill of 125 elk.

Zion Park deer.—Studies during the past decade revealed that mule deer in Zion National Park had increased far beyond food supply limits. Hunting outside the park boundary proved utterly ineffective in reducing the population or even in keeping it in bounds. Zion Canyon offers a sheltered wintering ground and freedom from predators, with the result that the range has been badly depleted. A few more years would have seen almost total destruction of food plants, as well as fatal deterioration of the deer. In cooperation with the Utah State Game Department, therefore, 300 deer were removed. The animals were killed by park rangers and turned over to the State game authorities.

Rocky Mountain Park elk and deer.—The east central region of Rocky Mountain National Park has been subjected to heavy overuse by elk and deer for at least 15 years. Original tendencies of the animals to migrate to lower elevations outside of the park have been inhibited by human developments blocking the original migration route. These ancestral winter ranges of the elk and deer, furthermore, have been devoted to close grazing by domestic stock. To meet this situation, plans were made in cooperation with the Colorado game authorities to reduce the herds by approximately one-third, or 200 deer and 300 elk. It was impracticable to carry out the program during the winter of 1943-44 (only 14 deer and 12 elk were eliminated) and it is planned to complete the program next winter.

WILDLIFE INVESTIGATIONS

In order to conserve, protect, and manage the important wildlife resources of the National Park System, insofar as diminished manpower and appropriations would permit, essential fact-finding programs were continued as to condition of, and changes in, important species. Assistance was furnished by the Fish and Wildlife Service for a faunal investigation on the western portion of Olympic National Park, and information supplied on the wildlife, particularly elk, in Jackson Hole National Monument. A life history study of the Yellowstone elk was resumed, to fill out many gaps in our knowledge of the famous northern herd, and to work out a successful management and range restoration program. A cooperative project is contemplated, with all Federal and State agencies concerned contributing information.

Yellowstone Park personnel initiated a life history study of the park buffalo. Studies were continued on the depleted winter range in the east central portion of Rocky Mountain National Park. The Zion National Park staff, assisted by an investigator of the Fish and Wildlife Service from the Utah Cooperative Wildlife Research Station, accumulated important data on the 300 deer that were eliminated from Zion Canyon in November and December 1943. Studies of the black bear in Yosemite Valley were made as a guide to management of that species. Bear feeding has been eliminated in all national parks. At Mesa Verde National Park, Colorado State officials continued investigations of forage on the mesa as a part of a regional program to determine carrying capacities for deer that range across national park, forest, and private lands without regard to boundaries. The Merriam turkey was restocked in Mesa Verde by the Colorado Game and Fish Commission. This species is known to have existed

there during the Indian era, but disappeared probably at the time of the great drought (A. D. 1276-99) that also forced aboriginal inhabitants to migrate.

PROTECTION OF PARK FORESTS

Protection of the remnants of the formerly widespread virgin forests of America now held as representative exhibits in the national parks continued to be a Service responsibility of first magnitude. The normal problems of protection from fire, insects, and disease and from preventable injury in areas of intensive use were further aggravated by the increasing shortage of experienced protection personnel, available fire fighters, and other workers.

During the 1943 calendar year 308 forest fires originated within or entered areas of the National Park System, a decrease of 23 percent from the previous 10-year average. A total of 10,444 acres was burned over, 70 percent of which involved a forest fire in Saguaro National Monument and a grass fire at Dinosaur National Monument.

The forest insect situation generally continued to be favorable, indicating the value of previous maintenance control measures. Three areas, however, reported threatening conditions. At Bryce Canyon National Park an epidemic of the Black Hills beetle required continued control. In Yosemite National Park, as a result of a fire in 1941, an epidemic of forest insects required control measures. A serious outbreak of the spruce budworm attacked spruce, Douglas-fir, and ponderosa pine in Rocky Mountain National Park. Experiments which indicate improved control methods are being undertaken with the cooperation of the Bureau of Entomology and Plant Quarantine.

The intensive white pine blister rust control program has resulted in initial control or reeradication work on 253,000 acres to date, leaving 190,000 acres within important pine areas of the national parks still unworked but needing attention. This threat to some of the finest forests in the parks is yearly becoming more imminent.

LAND STATUS

Since investigations have practically ceased for the duration, and acquisitions have been confined to acceptances of donations under authority of Congress or rectification of boundaries, land area changes were few during the past year. Especially noteworthy was establishment of the

NEW NATIONAL PARK AT BIG BEND, TEX.

This newest and twenty-seventh national park was established on June 12, 1944, in accordance with authority granted by Congress on June 20, 1935. Covering an area of 707,895 acres it is our sixth largest

national park. Its creation was made possible by the efforts and generosity of the State of Texas, which acquired and contributed all but 16,556.50 acres of the area to the Federal Government.

Big Bend National Park deserves the place it has been granted among the primary areas of the National Park System. It embraces a region of elusive lasting charm and arresting scenery. Perpendicular gorges cleft by the Rio Grande in the Santa Elena and Boquillas Canyons are a sharp contrast to the cool forested slopes and summits of the Chisos or "Ghost" Mountains that rise above the arid plain. Human history, rare wildlife species, mountain and desert plant life, and their combination in natural settings make it "a biological island in an expanse of desert." The paramount purpose of this national park must be the preservation of its vast wilderness as an inspiring "last frontier" on our southern border. The possibility of the establishment by Mexico of a similar park across the Rio Grande presents opportunity for a lasting memorial to international amity through linking the natural and human history of our two countries.

Developments for the benefit of visitors to the Big Bend will have to wait until the termination of the war. The necessary planning, however, is in progress.

HOME OF FRANKLIN D. ROOSEVELT NATIONAL HISTORIC SITE

By gift from President Roosevelt, title to his home at Hyde Park, N. Y., with approximately 33 acres of ground, passed to the United States on January 15, 1944, for preservation as a national historic site. Congress in 1939 authorized this step. The site adjoins the Library which the President gave to the Nation in 1939. Under the terms of the deed, actual administration of the national historic site for the benefit of the public shall begin when life interests held in the estate by the President, Mrs. Roosevelt, and the Roosevelt children shall have terminated. The property fronts on the historic New York and Albany Post Road. James Roosevelt, the President's father, acquired it in 1867, and the President was born there in 1882. The President's life has been intimately associated with this home, where since 1933 the heads of many foreign governments, including Prime Minister Churchill, have visited.

TOTAL ACREAGE ACCEPTED

The total acreage accepted by the Department of the Interior for park purposes during the year, both in established parks and approved projects, was 701,167.65 acres.

Lands acquired by the National Park Service July 1, 1943, to June 30, 1944

	Acquired by—	Funds expended		Acres	Total Federal lands in area (acres)
		Federal funds	Donated funds		
Acadia National Park, Maine.....	Donation.....	2,700.00	27,870.99
Antietam National Battlefield Site, Maryland.....	Donation.....	128.59	183.32
Appomattox Court House National Historic Monument, Virginia.....	Donation.....06	973.30
Big Bend National Park, Texas.....	Donation.....	691,338.95	691,338.95
Blue Ridge Parkway, Virginia.....	Transfer.....	105.80	38,910.00
Blue Ridge Parkway, North Carolina.....	Donation.....	1,679.58

Eastern Band of Cherokee Indians, North Carolina—Great Smoky Mountains National Park.....	Sale.....	905.27
State of California—Lassen Volcanic National Park.....	Exchange.....	6.25
Less area transferred.....	29,307.62
Total Federally Owned Land.....	22,367,503.96
Non-Federal land within authorized boundaries.....	895,651.46
Grand total.....	23,263,155.42

NON-FEDERAL HISTORIC SITE ESTABLISHED

St. Paul's Church, Eastchester, National Historic Site.—Historic St. Paul's Church, associated with events leading to the establishment of the Bill of Rights, became a national historic site July 5, 1943.

No transfer of property from the Episcopal Church Corporation was made; but under the terms of the Historic Sites Act of August 21, 1935, the National Park Service will cooperate in its management and preservation. St. Paul's is a noteworthy example of the Renaissance revival style of architecture in America, and the best example now standing of the eighteenth century parish church of the central colonies.

PROGRESS ON NATIONAL PARK AND MONUMENT PROJECTS

Everglades National Park project.—Interest in the possibility of substantial oil discoveries in the Everglades region is flourishing in Florida. As a consequence, the park project has become more complicated. If the park cannot be established, some provision for more protection for the wildlife of the area must be provided. The Service has agreed with Dr. Ira N. Gabrielson, Director of the Fish and Wildlife Service, and the Secretary has proposed to the State of Florida, that until the obstacles to the park are cleared up, some of the lands should be administered as a wildlife refuge. The national park project has by no means been abandoned, but if the park does not eventually materialize, the refuge should be made permanent.

Cape Hatteras National Seashore Recreational area project.—Gratifying progress was made by North Carolina in its acquisition program. The North Carolina Cape Hatteras National Seashore Commission, with assistance from this Service, in November 1943 made a reconnaissance survey to determine boundaries in relation to the numerous small communities within or bordering the most important of the three acquisition units in the project.

Richmond National Battlefield Park and Fort Frederica National Monument projects.—Progress is being made on the clearance of title to the lands being donated for these projects, and their establishment as units of the National Park System is imminent. Because of their historic interest, they will be a distinct asset to the National Park System. The Richmond Battlefield Park contains several areas over which the Union and Confederate Armies fought during the Union drives on Richmond, Va., the Confederate Capital. Fort Frederica, in Georgia, was built in 1736 by General James Edward Oglethorp, founder of Georgia, as an English outpost against Spain, which then owned Florida.

Grandfather Mountain.—A non-Federal organization, the Grandfather Mountain Park Association, was established for the purpose of acquiring, for donation to the Federal Government as part of the Blue Ridge Parkway, some 12,000 acres including Grandfather Mountain, N. C., one of the most outstanding features of the entire 484-mile parkway route.

Iowa Indian Effigy Mounds National Monument project.—The State of Iowa is pursuing land acquisition, but probably will defer donation to the Federal Government until after the war.

Olympic Parkway, Wash.—This Public Works project of some 53,000 acres, is still in the land acquisition stage. Some general studies have been made regarding the parkway location.

George Washington Carver National Monument project, Missouri.—No practical advance was made in this project to preserve the birth-place of the late Dr. Carver, noted Negro scientist, as authorized by act of Congress, because of the high valuation placed by the owner on the lands.

Cumberland Gap National Historical Park project.—This 6,000-acre project has progressed encouragingly. Land surveys, essential to negotiations for the purchase of the individual properties, were begun by the States of Kentucky, Tennessee, and Virginia. Funds for land purchases are available in the three States, and Congress, by act of May 26, 1943, gave consent to their entering into a compact under which the necessary properties may be acquired and conveyed to the Federal Government.

Manuelito National Monument project.—The legislature of New Mexico has appropriated funds with which to acquire the most important Indian allotments; and effort is being made to complete the land and development programs of this archeological project located in the States of New Mexico and Arizona.

TVA TO TRANSFER LAND TO GREAT SMOKY MOUNTAINS NATIONAL PARK

By agreement between the Tennessee Valley Authority, the State of North Carolina, Swain County in that State, and the National Park Service, 44,000 acres of land lying between the reservoir above Fontana Dam on the Little Tennessee River and Great Smoky Mountains National Park are being purchased by Tennessee Valley Authority for addition to the park in consideration of post-war road construction to be undertaken by the Service. This addition rounds out Great Smoky Mountains National Park in accordance with the original concept.

THE PROBLEM OF PRIVATE HOLDINGS

The total gross area of land within the boundaries of the 169 areas constituting the National Park System amounts to 21,076,459.41 acres. Of this total, 621,445.12 acres are privately owned and not subject to the rules and regulations governing the 20,455,014.29 net acreage of the system. From the standpoint of protecting and administering the parks, these inholdings are a serious handicap; in fact, they constitute the greatest single land problem of the Service. While no definite action is possible during the war, the Service has done what it can to

No transfer of property from the Episcopal Church Corporation was made; but under the terms of the Historic Sites Act of August 21, 1935, the National Park Service will cooperate in its management and preservation. The total gross area of land within the boundaries of the 169 areas constituting the National Park System amounts to 21,076,459.41 acres. Of this total, 621,445.12 acres are privately owned and not subject to the rules and regulations governing the 20,455,014.29 net acreage of the system. From the standpoint of protecting and administering the parks, these inholdings are a serious handicap; in fact, they constitute the greatest single land problem of the Service. While no definite action is possible during the war, the Service has done what it can to

No transfer of property from the Episcopal Church Corporation was made; but under the terms of the Historic Sites Act of August 21, 1935, the National Park Service will cooperate in its management and preservation. St. Paul's is a noteworthy example of the Renaissance revival style of architecture in America, and the best example now standing of the eighteenth century parish church of the central colonies.

PROGRESS ON NATIONAL PARK AND MONUMENT PROJECTS

Everglades National Park project.—Interest in the possibility of substantial oil discoveries in the Everglades region is flourishing in Florida. As a consequence, the park project has become more complicated. If the park cannot be established, some provision for more protection for the wildlife of the area must be provided. The Service has agreed with Dr. Ira N. Gabrielson, Director of the Fish and Wildlife Service, and the Secretary has proposed to the State of Florida, that until the obstacles to the park are cleared up, some of the lands should be administered as a wildlife refuge. The national park project has by no means been abandoned, but if the park does not eventually materialize, the refuge should be made permanent.

Cape Hatteras National Seashore Recreational area project.—Gratifying progress was made by North Carolina in its acquisition program. The North Carolina Cape Hatteras National Seashore Commission, with assistance from this Service, in November 1943 made a reconnaissance survey to determine boundaries in relation to the numerous small communities within or bordering the most important of the three acquisition units in the project.

Richmond National Battlefield Park and Fort Frederica National Monument projects.—Progress is being made on the clearance of title to the lands being donated for these projects, and their establishment as units of the National Park System is imminent. Because of their historic interest, they will be a distinct asset to the National Park System. The Richmond Battlefield Park contains several areas over which the Union and Confederate Armies fought during the Union drives on Richmond, Va., the Confederate Capital. Fort Frederica in Georgia, was built in 1736 by General James Edward Oglethorpe, founder of Georgia, as an English outpost against Spain, which then owned Florida.

Grandfather Mountain.—A non-Federal organization, the Grandfather Mountain Park Association, was established for the purpose of acquiring, for donation to the Federal Government as part of the Blue Ridge Parkway, some 12,000 acres including Grandfather Mountain, N. C., one of the most outstanding features of the entire 484-mile parkway route.

Iowa Indian Effigy Mounds National Monument project.—The State of Iowa is pursuing land acquisition, but probably will defer donation to the Federal Government until after the war.

Olympic Parkway, Wash.—This Public Works project of some 53,000 acres, is still in the land acquisition stage. Some general studies have been made regarding the parkway location.

George Washington Carver National Monument project, Missouri.—No practical advance was made in this project to preserve the birthplace of the late Dr. Carver, noted Negro scientist, as authorized by act of Congress, because of the high valuation placed by the owner on the lands.

Cumberland Gap National Historical Park project.—This 6,000-acre project has progressed encouragingly. Land surveys, essential to negotiations for the purchase of the individual properties, were begun by the States of Kentucky, Tennessee, and Virginia. Funds for land purchases are available in the three States, and Congress, by act of May 26, 1943, gave consent to their entering into a compact under which the necessary properties may be acquired and conveyed to the Federal Government.

Manuelito National Monument project.—The legislature of New Mexico has appropriated funds with which to acquire the most important Indian allotments; and effort is being made to complete the land and development programs of this archeological project located in the States of New Mexico and Arizona.

TVA TO TRANSFER LAND TO GREAT SMOKY MOUNTAINS NATIONAL PARK

By agreement between the Tennessee Valley Authority, the State of North Carolina, Swain County in that State, and the National Park Service, 44,000 acres of land lying between the reservoir above Fontana Dam on the Little Tennessee River and Great Smoky Mountains National Park are being purchased by Tennessee Valley Authority for addition to the park in consideration of post-war road construction to be undertaken by the Service. This addition rounds out Great Smoky Mountains National Park in accordance with the original concept.

THE PROBLEM OF PRIVATE HOLDINGS

The total gross area of land within the boundaries of the 169 areas constituting the National Park System amounts to 21,076,459.41 acres. Of this total, 621,445.12 acres are privately owned and not subject to the rules and regulations governing the 20,455,014.29 net acreage of the system. From the standpoint of protecting and administering the parks, these inholdings are a serious handicap; in fact, they constitute the greatest single land problem of the Service. While no definite action is possible during the war, the Service has done what it can to

No transfer of property from the Episcopal Church Corporation was made; but under the terms of the Historic Sites Act of August 21, 1935, the National Park Service will cooperate in its management and preservation. St. Paul's is a noteworthy example of the Renaissance revival style of architecture in America, and the best example now standing of the eighteenth century parish church of the central colonies.

PROGRESS ON NATIONAL PARK AND MONUMENT PROJECTS

Everglades National Park project.—Interest in the possibility of substantial oil discoveries in the Everglades region is flourishing in Florida. As a consequence, the park project has become more complicated. If the park cannot be established, some provision for more protection for the wildlife of the area must be provided. The Service has agreed with Dr. Ira N. Gabrielson, Director of the Fish and Wildlife Service, and the Secretary has proposed to the State of Florida, that until the obstacles to the park are cleared up, some of the lands should be administered as a wildlife refuge. The national park project has by no means been abandoned, but if the park does not eventually materialize, the refuge should be made permanent.

Cape Hatteras National Seashore Recreational area project.—Gratifying progress was made by North Carolina in its acquisition program. The North Carolina Cape Hatteras National Seashore Commission, with assistance from this Service, in November 1943 made a reconnaissance survey to determine boundaries in relation to the numerous small communities within or bordering the most important of the three acquisition units in the project.

Richmond National Battlefield Park and Fort Frederica National Monument projects.—Progress is being made on the clearance of title to the lands being donated for these projects, and their establishment as units of the National Park System is imminent. Because of their historic interest, they will be a distinct asset to the National Park System. The Richmond Battlefield Park contains several areas over which the Union and Confederate Armies fought during the Union drives on Richmond, Va., the Confederate Capital. Fort Frederica, in Georgia, was built in 1736 by General James Edward Oglethorpe, founder of Georgia, as an English outpost against Spain, which then owned Florida.

Grandfather Mountain.—A non-Federal organization, the Grandfather Mountain Park Association, was established for the purpose of acquiring, for donation to the Federal Government as part of the Blue Ridge Parkway, some 12,000 acres including Grandfather Mountain, N. C., one of the most outstanding features of the entire 484-mile parkway route.

Iowa Indian Effigy Mounds National Monument project.—The State of Iowa is pursuing land acquisition, but probably will defer donation to the Federal Government until after the war.

Olympic Parkway, Wash.—This Public Works project of some 53,000 acres, is still in the land acquisition stage. Some general studies have been made regarding the parkway location.

George Washington Carver National Monument project, Missouri.—No practical advance was made in this project to preserve the birth-place of the late Dr. Carver, noted Negro scientist, as authorized by act of Congress, because of the high valuation placed by the owner on the lands.

Manuelito National Monument project.—The legislature of New Mexico has appropriated funds with which to acquire the most important Indian allotments; and effort is being made to complete the land and development programs of this archeological project located in the States of New Mexico and Arizona.

TVA TO TRANSFER LAND TO GREAT SMOKY MOUNTAINS NATIONAL PARK

By agreement between the Tennessee Valley Authority, the State of North Carolina, Swain County in that State, and the National Park Service, 44,000 acres of land lying between the reservoir above Fontana Dam on the Little Tennessee River and Great Smoky Mountains National Park are being purchased by Tennessee Valley Authority for addition to the park in consideration of post-war road construction to be undertaken by the Service. This addition rounds out Great Smoky Mountains National Park in accordance with the original concept.

THE PROBLEM OF PRIVATE HOLDINGS

The total gross area of land within the boundaries of the 169 areas constituting the National Park System amounts to 21,076,459.41 acres. Of this total, 621,445.12 acres are privately owned and not subject to the rules and regulations governing the 20,455,014.29 net acreage of the system. From the standpoint of protecting and administering the parks, these inholdings are a serious handicap; in fact, they constitute the greatest single land problem of the Service. While no definite action is possible during the war, the Service has done what it can to

formulate a comprehensive program for the acquisition of these privately-owned lands. Legislation providing funds for a continuous land acquisition program directed to the acquisition of inholdings is sorely needed.

ADVISORY BOARD

The Interim Committee of the Advisory Board on National Parks, Historic Sites, Buildings, and Monuments met once during the year to advise on war and postwar problems. Attending were Edmund H. Abrahams (chairman), Dr. Waldo G. Leland, Col. Richard Lieber, Charles G. Sauers, Dr. Frank Setzler (secretary), and Dr. Ralph W. Chaney. Other members of the Board are Dr. Clark Wissler (vice chairman), Dr. Thomas Barbour, Dr. Herbert E. Bolton, Mrs. Reau Polk, and Dr. Fiske Kimball.

The death early in July 1943 of George De Benneville Keim, Board member, was reported last year. The Service now records with deep regret the death of another member, Col. Richard Lieber, noted authority on conservation. Colonel Lieber's contribution in the fields of conservation and the humanities, both to the Nation and to his own State of Indiana, cannot be overestimated. Service officials benefited greatly from his wisdom and experience.

Dr. Ralph W. Chaney, paleontologist of the University of California, was appointed a member of the board vice Mr. Keim. The vacancy created by Colonel Lieber's death has not yet been filled.

COOPERATING FEDERAL AGENCIES

Public Roads Administration.—New regulations implemented the working agreement that had been in effect since 1926 between the National Park Service and the Public Roads Administration. Included are new cooperative features applicable to the planning and construction of major roads and to planning for the maintenance of roads constructed by the Public Roads Administration. The regulations were approved by the Secretary of the Interior and the Federal Works Administrator pursuant to a requirement contained in the 1940 Federal Aid Highway Act.

Public Health Service.—A new agreement has been made with the United States Public Health Service providing that its eight district sanitary engineers shall furnish advice and service on sanitation matters in the National Park System. The high plane upon which this cooperative work has been conducted was largely due to the pioneering by Sanitary Engineer Harry B. Hommon, who retired in 1943.

Fish and Wildlife Service.—An agreement was reached between the Fish and Wildlife Service and the National Park Service as to the detailing of biologists for wildlife investigations in national park areas. This cooperation is especially helpful at a time when park protective and research staffs have been cut to a bare minimum.

Civilian Public Service Program.—Five Civilian Public Service Camps—conscientious objectors—again were allocated to the National Park Service and assigned to the Blue Ridge Parkway and Shenandoah, Great Smoky Mountains, Glacier, and Sequoia-Kings Canyon National Parks. These men were trained for and placed primarily on jobs involving forest protection, but also assisted in maintenance work, tree-disease control, and soil and moisture conservation in much the same manner as did the Civilian Conservation Corps on a much larger scale before the war. Their presence helped to meet the manpower shortage in the five areas concerned.

ADMINISTRATIVE ORGANIZATION

In general, the administrative organization remains unchanged as it concerned the responsibilities and activities of the Director's Office, located in Chicago as a wartime measure since August 1942. Organization of the four regional offices was improved, despite drastic personnel cuts. The units of the National Park System, particularly the smaller areas, have been hard put to it to carry their administrative responsibilities because of the loss of experienced members of their staffs, but have met these responsibilities well. Kings Canyon National Park and the adjoining Sequoia National Park were placed under a single superintendent for reasons of economy and effective administration.

The Service suffered a serious loss in the death of George A. Moskey, Chief Counsel, in February 1944. Mr. Moskey contributed much to Service policy and procedure during the formative years of the bureau and in the period of emergency expansion. Of him it has been said: "He was an attorney who knew how to apply the science of democratic government." The vacancy created by Mr. Moskey's death was filled by the transfer of Jackson E. Price from the position of Assistant Solicitor of the Department of the Interior.

The position of Biologist was established in the Director's Office and filled by the transfer back to the Service of Victor H. Cahalane, formerly Chief of the Wildlife Division, who, in a departmental reorganization in 1939, was transferred to the Fish and Wildlife Service. As chief of that agency's section on National Park Wildlife he handled park wildlife problems until his retransfer to the National Park Service.

Following the trends of previous years, the number of permanent full-time positions in the Service was reduced from the 1,974 reported on June 30, 1943, to 1,573 on June 30, 1944, resulting in severe handicaps in the basic fields of administration, protection, and maintenance. The number of employees of the Service just before Pearl Harbor was 5,963.

Increased use was made of women as park rangers and fire lookouts during the summer months; and as more veterans return to civil life attention is being given to placing them in vacant positions. By such means and the use of older men, with some relaxation of physical and qualifications standards, it has been possible to maintain reasonably adequate staffs despite the critical manpower shortage. The Service gained by the return of several of its supervisory officials released by the Army. On June 30, 651 National Park Service employees were on furlough with the armed forces and 617 had transferred to civilian war agencies with reemployment rights.

The highly trained, competent, and vigorous personnel who have left the Service to enter the armed forces constitute one of its most important contributions to the prosecution of the war. The Service recognizes an obligation to perpetuate for them the integrity of the National Park System. This obligation is being met by those who have remained, and who have shown themselves constant to their tasks. Their loyalty and devotion deserve clear recognition.

INFORMATION TABLE

There follows a table showing the units of the National Park System, including several projects now being administered by the Service pending transfer of lands, the acreage of these areas, and the number of visitors:

National Park System, acreage, and number of visitors

Areas (classification)	Location (State)	Net acreage	Approximate visitors, fiscal year July 1, 1943-June 30, 1944	Approximate visitors, 5-year average, 1940-44	Visitors, peak year (1941 unless otherwise stated)

Office of Indian Affairs

JOHN COLLIER, Commissioner

THE truly epic story of Indian heroism on all the battle fronts of the planet, unstintingly backed by the toil of Indian men, women, and children on farm and range and in the war industries, has broadened and deepened during the past year.

On the first of April, 21,756 Indians, exclusive of officers, had joined the fighting forces, of which number 19,284 were in the Army, 1,555 in the Navy, 574 in the Marine Corps, 127 in the Coast Guard, and 216 in the Wacs and Waves.

NUMEROUS DECORATIONS

Throughout the Pacific area, in China, North Africa, Sicily, Italy, and Normandy, Indians have served with conspicuous gallantry, winning all decorations, in addition to numerous citations and commendations. By the end of June, 16 had received the Distinguished Flying Cross; 29, the Air Medal; 20, the Silver Star; 4, the Distinguished Service Cross; 1, the Soldier's Medal; 1, the Distinguished Service Medal; 1, the Navy Cross; 1, the Medal of Honor; and 1, the Croix de Guerre. Seventy-five had been awarded the Purple Heart. Some had received more than 1 decoration, and numerous Oak Leaf Clusters had been distributed in lieu of further awards of a given medal or in recognition of flying missions achieved. Several had received from 6 to 14 Clusters each.

THE CONGRESSIONAL MEDAL OF HONOR

Until April last, no Indian had received the Congressional Medal of Honor. Now, thanks to Second Lieutenant Childers, a three-quarters Creek of Broken Arrow, Okla., this honor also may be claimed by the first Americans. Lieutenant Childers, who had won his commission on the battlefield during the invasion of Sicily, was awarded the nation's highest military honor as the result of an all but incredible

exploit performed near Oliveto, Italy, in September 1943. Hobbling with a broken instep, he advanced alone against three German machine-gun nests, rubbed them out, and opened the way for the advance of his battalion which had been in danger of annihilation. Only 14 Medals of Honor have been awarded thus far in the war, 3 in the Mediterranean theater.

A GLOBE-EMBRACING STORY

Decorations serve only to highlight the globe-embracing story of the Indian fighting man's gallantry and efficiency, as indicated by reports from all fronts. A group of 13 Indians from nearly as many tribes was in the first wave of paratroopers dropped with demolition equipment upon German defenses in France at the beginning of the Normandy drive. Harlyn Vidovich, "The Sky Chief," a Shoshone-Paiute of Sacaton, Ariz., won fame as one of General Chennault's "Flying Tigers," was commended by General Chiang-Kai-shek, and was promoted to the grade of captain shortly before his death in China last January. A noted Cherokee woodcarver, Going Back Chiltoskey, was employed by the Engineer Board in making scale models of terrain and buildings for the plans of the African invasion. It was an Omaha Indian boy, Pvt. Robert Stabler, who, in July last year, landed alone under heavy fire in advance of the assault waves at Licata, Sicily, to mark the beaches for the infantry craft—an exploit for which he received the commendation of his general. He had volunteered for service at the age of 20, and he wore no medal when he died of wounds in Italy last January.

The story of Indian heroism cannot be told in terms of medals and commendations. It is woven closely into the untold all-American tale of high heroism everywhere, regardless of race and color and creed.

FAITH AND WORKS

The profound seriousness with which Indians generally are devoting their energies to the prosecution of the war has been conspicuously evidenced by the religious observances of the homefolk. Indians in the old days, interwove religion into everyday living to an extent unknown in white society; and out of the depths of racial memory, sacred ceremonies have been revived by many tribes as an expression of their dedication to a great common cause and their dependence upon divine aid for its achievement. In various instances, Christian Indians have joined their prayers with the ancient supplications of their people, in the true American spirit of religious liberty. These expressions of profound faith and dedication, notably increased during the past year, have accompanied heroic works at home, as well as abroad, even as in the old days.

THE GREATEST EXODUS OF INDIANS

The war has brought about the greatest exodus of Indians from reservations that has ever taken place. Out of a total of approximately 65,000 able-bodied men from 18 to 50 years of age, 30 percent have joined the armed forces and about 25 percent are engaged in war industries and other essential war services. In addition, more than 10,000 men, women, and children have left the reservations for varying periods to work on farms and ranches. Thus, at least half of the able-bodied men and about one-fifth of other employable persons have been drained from the reservations. Reports show that there were 8,683 fewer Indian families residing at home in 1943 than in 1941.

WOMEN, CHILDREN, AND OLD MEN CARRY ON

Notwithstanding this great loss of manpower at home, the total production of agricultural commodities by Indians on all reservations was greater in 1943 than in 1942. Approximately 1,000 more families engaged in farming and stockraising. Although a greater acreage of land was planted to all crops, less grain and feed were sold, owing to the increased feed requirements of the great number of livestock on hand. At the end of 1943, Indians on all reservations owned a total of 1,531,000 head of livestock—90,000 more than at the end of the previous year, and, incidentally, double the number owned by them in 1933. The total receipts from livestock sales in 1943 amounted to \$10,533,079, which was \$667,000 greater than in 1942, and five times more than in 1933. The total value of all sales of Indian agricultural products was \$19,077,333, compared with \$17,457,241 in 1942; and the total value of all food produced and used in the home was \$8,364,792, compared with \$7,985,584 in the preceding year.

This remarkable achievement may be credited largely to the eagerness and ability of Indian women, children, and older men to carry on while the young men are away. The bond between the Indian and his homeland is very strong, and most Indians in the far-flung battle areas write home, giving instructions for the management of livestock and farming operations, and dwelling on the plans they have in mind for the post-war years.

REMARKABLE ACHIEVEMENT OF SCHOOL CHILDREN

The same enthusiastic response to the needs of the time was to be noted in the schools of the Indian Service, whose production of fruits, vegetables, meat, milk, and eggs was almost 50 percent greater in 1943 than in the previous year, although many high school students were serving in the armed forces or in war industries. Nearly 3 million pounds of fruits and vegetables were stored and used. A large number of the schools were on a self-sustaining basis, so far as agricultural

produce was concerned, and large quantities of vegetables, meat, milk, and eggs were marketed for the general need. Fifty-eight thousand gallons of fruit and vegetables were canned.

Dehydrators, on the model developed at the Phoenix Indian School, in collaboration with the United States Department of Agriculture, were erected at half a dozen other schools in the Indian Service. As a result, more than ten tons of fruits and vegetables were dehydrated in the schools of the Indian Service, from which supply the boarding schools and hospitals in Alaska were furnished most of their vegetables for the year at a great saving in freight cost. In addition to the foregoing, the Indian schools produced more than 9,000 tons of hay, nearly 3,000 tons of grain, and more than 5,000 tons of silage.

A great share of the labor involved in producing such quantities of foodstuff was furnished by the Indian boys and girls themselves, and many employees of the Indian Service sacrificed their vacation time that they might help in the fields.

INVESTING IN DEMOCRACY

The Indian people's faith in their country and their devotion to the cause of Democracy have been further attested by their war bond purchases.

It is estimated that bond sales to Indians had reached a grand total of \$50,000,000 on June 30. During the fiscal year 1944, group investments amounted to \$2,517,000, and sales to restricted Indians totaled \$1,525,664. In addition, during the year the Office of Indian Affairs had received for safekeeping bonds purchased by individuals with their unrestricted funds in the amount of \$92,438. The latter item represents only a portion of such purchases.

On many reservations war bond auction sales and bond pow-wows have been patronized with remarkable enthusiasm. In January, the Lower Brule Sioux sponsored an auction at Reliance, S. Dak., in which donations, ranging from a sack of peanuts to poultry and horses, garments and fancy quilts, were disposed of to the highest bidder in bonds. Sales totaled \$22,000, half of which was realized through the donations of the Indians. A Sioux boy sacrificed his pet colt, which brought \$925 in securities. An old longhair wept when told that he could not donate 320 acres of land to the cause.

The Phoenix Indian School was awarded the Treasury Department's certificate of merit for its success in organizing a bond pow-wow that resulted in sales amounting to \$58,177. In the Fourth War Loan Drive, the Papago Reservation exceeded its quota by almost 600 percent, although the State of Arizona as a whole fell behind. In Alaska, many isolated villages have sacrificed the white man's food and clothing in order to buy bonds.

Although the amount donated by Indians to the Red Cross and to the National War Fund cannot be stated with accuracy, it is known to be very large and in proportion to the general whole-hearted response of Indians to the needs of the time.

LAND ACQUISITION

Although no additional public funds for land purchases were appropriated for the fiscal years 1944 and 1945, funds appropriated in past years permitted purchases involving 17,337.29 acres at a cost of \$105,860.70. Also, 631,887.51 acres were restored to tribal ownership on the Wind River Reservation in Wyoming, under authority of the act of July 27, 1939.

The desire of the Indians to increase their land holdings is evidenced by the fact that tribal funds amounting to \$183,450.68 were used during the past year in purchasing 37,720.18 acres on 12 reservations. Many tribes possessing funds have demonstrated their determination to invest a substantial portion of their money in this way. In addition to the above, 2,680 acres were withdrawn from the public domain for reservation purposes and for the benefit of certain individual Indians.

NEW RESERVATIONS IN ALASKA

The large influx of population into Alaska as a result of war activities, and the growing encroachment of the whites upon the land and resources of the Indians and Eskimos have served to emphasize the most serious problem confronting the natives—the protection of their ancestral hunting, trapping, and fishing bases. Recognizing the fundamental importance of the problem, the Office of Indian Affairs, early in the year, detailed a special representative to the Territory to supervise the work of establishing reservations.

Under authority of the act of May 1, 1936, six reservations were formally established in Alaska during the fiscal year 1944, as follows: Akutan, in the Aleutian Islands, area 72,000 acres; Karluk on Kodiak Island, 32,000 acres; Venetie, on the Upper Yukon, 1,408,000 acres; Shishmaref, 3,000 acres, and Wales 21,000 acres, both on Seward Peninsula.

Proposals for the creation of 16 additional reserves totaling 3,729,420 acres, have been received and are now under consideration. Two of the proposed reservations are located on the upper, and 1 on the lower, Tanana River; 2 are in southeastern, and 5 in central Alaska; 5 are along the Arctic coast; and 1 on the Noatak River.

LAND CONSOLIDATION

The absurd fragmentation of Indian estates under the allotment and inheritance system, resulting in great economic loss to the Indians and much unproductive administrative expense to the Government, has received further attention by the Sioux of South Dakota during the past year. The organization of the Tribal Land Enterprise by the Rosebud Sioux marks an encouraging advance toward the solution of this serious and complicated problem. The new organization's bylaws were approved by the Secretary of the Interior in December last, and its first "certificate of interest" was issued in January.

The purpose of the new enterprise, in keeping with the general Sioux land consolidation program, is to acquire individually owned allotments and fractional inherited interests in exchange for use rights in compact tribally owned areas thus established; also to purchase scattered interests and key tracts with tribal funds. Indians are coming to realize that only by such a method can the progressive, and otherwise ultimately ruinous, evil of fractional land ownership be ended. Already the Rosebud Tribal Land Enterprise has approximately 30,000 acres under its management, and there is a growing interest in the plan. The South Dakota projects are being watched by Indians elsewhere, and this movement to establish land ownership on a sound basis may well spread to many other allotted reservations of the western States.

LAND CONSERVATION

In the long view, the control of erosion on the home front must be regarded as secondary only to the successful conclusion of the war. Now that soil is being used more intensively than ever before, its fertility is being taxed to the limit. Accelerated erosion is destroying millions of acres of Indian land, in common with other lands throughout the nation.

The Indian Service has given increasing attention to aiding Indians in following conservation practices which will yield maximum production with a minimum of soil losses. During the war, with curtailed appropriations, such practices can be applied only in emergencies, to critical areas and to those which will most readily respond to treatment under the load of maximum production.

It has been fully demonstrated that the practice of scientific conservation on farm lands will increase yields by 20 percent, and in many instances by as much as 100 percent. The possibility of such increase has been demonstrated on the Florine Little Bear farm of 80 acres in Oklahoma. On this land the corn yield was increased from 100 to 360 bushels, hay from 20.5 to 38 tons, cotton from two to four bales, pasture carrying capacity from 48 to 63 animal-months.

THE RUINOUS COST OF SILTATION

The Salt River watershed in Arizona serves to reveal the values involved in the erosion and siltation problem of the West. At the present rate of siltation, the reservoirs of the Salt River Valley System will be completely silted full in 175 years. With this life expectancy it can be shown that the total annual loss resulting from reservoir sedimentation in this area is approximately a million dollars, or \$150 for each square mile of watershed.

The losses from siltation to downstream development in this area are greater each year than returns from the range and forest lands of the watershed. To these losses may be added large yearly damages from flood water. An amount equal to the losses to downstream developments, if applied for a 10-year period to the watershed, will reduce erosion and siltation to the minimum. Conclusive evidence on Navajo demonstration areas show that this can be done, with increasing returns to watershed users at the same time.

The Indian lands in the South and Southwest, comprising approximately one-half of all Indian lands, will require 111,400 man-years of unskilled labor, 31,650 man-years of skilled labor, 8,040 man-years of technical assistance, and 21,000 tractor-years to build the dams, terrace the fields, reseed the ranges, improve pastures, reconstitute cropping and cultural practices, stabilize stream banks, spread water, and do the other things necessary to preserve the soil and productivity of the upland farms and ranches, and to protect the downstream irrigation and public utility developments.

ACCOMPLISHMENTS IN 1944

The outstanding response of Indians to a program of conservation is attested by the fact that they spent in the past year for this purpose \$421,206 in terms of cash and contributed labor to supplement \$437,839 of Indian Office funds. The demand for assistance in preparing and carrying out conservation plans has been greater than the office could supply. Plans were requested on 544 land unit areas comprising 920,899 acres. Assistance in planning and establishing conservation practices was rendered on 330 units embracing 813,265 acres of Indian farm and range land, and erosion was checked in varying degrees on 536 farm units, comprising 206,266 acres.

Improved cropping practices were inaugurated on 53,047 acres, and drainage of 5,539 acres required 13 miles of ditching. Permanent farm pastures, totaling 10,000 acres, were established or improved. Worn out and badly gullied land, totaling 31,649 acres, was seeded to provide better soil cover and increased financial returns.

On the range land, improved management was instituted on 2,958,775 acres. The various activities undertaken to accomplish this in-

cluded the seeding of 17,518 acres, the contouring of 3,203 acres, the digging of 4,080 feet of drain canals, water spreading on 10,950 acres, the building of stock water tanks, and the development of wells and springs. Utilization checks, to learn the amount of forage being consumed and to determine the safe use of range, were made on 8,802,500 acres.

IRRIGATED LANDS AND POWER PROJECTS

Irrigation construction on Indian reservations was reduced to a minimum during the year in order to conserve materials for vital war projects, and only facilities for irrigating garden tracts were installed, noncritical materials being used. On lands already under irrigation, 37 internal distribution systems, comprising 10,000 acres, were revised to prevent waste and effect a more nearly uniform use of water.

During the year the irrigation projects of the Indian Service supplied water to 570,000 acres of farm lands on Indian reservations west of the Mississippi River. These lands, used by Indian and non-Indian farmers, have been devoted to increased production in keeping with the policy of the War Food Administration to emphasize maximum production in the area adjacent to shipping lanes for the Pacific war theater. Thus cross-country shipping facilities were conserved for other vital war materials. It is estimated that the combined farm crops raised on Indian irrigation projects during 1943 were sufficient to feed 10 Army divisions for a year. Forage crops were harvested for 300,000 head of beef cattle and 50,000 dairy cows.

Power systems, operated by the Indian Service along with irrigation projects, furnished 60 million kilowatt-hours of energy, directly and by inter-connection, to copper and molybdenum mines, manufacturing plants, city utilities, and other industrial and commercial consumers in the rural West. The San Carlos and Colorado River projects furnished irrigation water and power to relocation centers settled by 20,000 people of Japanese ancestry removed from the west coast and strategic defense areas. Power was furnished also to an army camp near Florence, Ariz., where prisoners of war are interned.

During the year, plans were developed for an impressive list of proposed irrigation projects on Indian reservations, to contribute to increased food production, to create post-war employment, and to make farms available for Indians returning from the armed services and industrial areas. On the San Carlos project, studies were made to prepare for post-war changes in commercial power loads.

MINERALS FOR WAR AND THE FUTURE

Will the petroleum and other mineral reserves on Indian lands be so depleted when peace comes as to render them insignificant in the post-war period? Not if the present exploratory activities, growing out of the Nation's war needs, meet with even a fair degree of success.

Already wartime discoveries of oil have been made on the Wind River Reservation in Wyoming, and on the Otoe and Pawnee lands of Oklahoma. Prospecting permits have been issued, with approval of tribal authorities, covering several hundred thousand acres in the Rocky Mountain region; and wildcat leasing blocks have been assembled on Indian lands in Montana, western Oklahoma, Mississippi, Wyoming, South Dakota, and New Mexico. Over a thousand oil and gas leases covering Indian lands have been approved during the past fiscal year.

QUAPAW RESERVATION MINES

Most gloomy of the predictions relating to post-war production of minerals from Indian lands have been concerned with the once-rich lead and zinc mines on the Quapaw reservation in the Tri-State mining district. But in spite of depletion of the richer ores, production from Indian lands within that district has borne up well. In the period from July 1, 1941, to June 30, 1943, the mines and tailing mills on restricted Indian lands of the Quapaw reservation sold 304,577 tons of lead and zinc, and the royalty received by restricted landowners from these sales amounted to nearly 2 million dollars. At the close of the fiscal year it was estimated that production for 1944 would equal that of the previous year.

Indian owners, the mining industry, the Geological Survey, and the Indian Service, are cooperating in arrangements to permit economical, unitized operations for the mining of lower grade ores and isolated high-cost ores. These arrangements and the industry's efforts to perfect improved methods for re-treating the ores and tailing piles may prove sufficient to prolong the productivity of the Quapaw mineral lands. Elsewhere in Oklahoma, prospecting permits, covering several thousand acres of Indian lands, have been approved in support of efforts to locate additional reserves of lead and zinc ores. In view of these activities, it seems probable that production of minerals from Indian lands will not decline in volume or importance during the war and for some time into the post-war period.

At present, leased Indian properties are producing minerals having an annual value in excess of 39 million dollars, yielding an annual income of nearly 6 million dollars in royalties to the Indian owners.

This estimate includes the total output of petroleum and its products, lead, zinc, copper, vanadium, helium, coal, tungsten, asbestos, manganese, gypsum, limestone, and marble.

COAL AND ASPHALT LANDS

The Choctaw and Chickasaw Nations once possessed lands encompassing many hundreds of square miles in the Southern States. Their last remaining communally held property, other than a few scattered tracts, consists of some 370,000 acres of coal deposits and about 3,000 acres of asphalt deposits that were segregated and reserved from allotment under the Atoka Agreement of 1898 and the supplemental agreement of 1902. A provision in the Interior Department Appropriation Act, approved June 28, 1944, paves the way for disposal of this last remaining property to the United States. The provision authorizes and directs the Secretary of the Interior to enter into a contract on behalf of the United States for the purchase of the lands and deposits. The contract is not to become effective unless ratified by the Indians in a referendum election, and then finally ratified by the Congress. The Principal Chief of the Choctaw Nation and the Governor of the Chickasaw Nation have indicated their desire to enter into the negotiations contemplated by the legislation, and plans for the negotiations are now receiving consideration.

INDIAN FORESTS

Based on a conservative estimate, there are approximately 35 billion feet of timber on about 16,700,000 acres of Indian lands in 19 states, 17 of which are located west of the Mississippi River. Of this volume approximately 80 percent is considered suitable for the production of lumber.

There have been active logging operations on many Indian reservations during the past year. The volume of timber cut for the production of lumber and other forest products was 502,867,000 feet. Since a very high percentage of the timber cut under contract went directly into military activities, the Indians and the Indian Service made every reasonable effort to furnish timber for cutting, consistent with sustained-yield management and available personnel. It is anticipated that the forests on Indian lands will continue to provide their full share of timber needed by the Nation during the war and post-war periods.

LUMBER ENTERPRISES OF INDIANS

During the past year the four Indian sawmill enterprises were operated with a reasonable degree of success. The volume of logs cut by each of these enterprises is as follows: Menominee Indian Mills, Neo-

pit, Wis., 18,337,000 feet; Red Lake Indian Mills, Redby, Minn., 5,360,000 feet; Navajo Indian Mills, Window Rock, Ariz., 7,718,000 feet; Fort Apache Sawmill, Whiteriver, Ariz., 1,008,000 feet. Limited available labor and equipment curtailed production to some extent. In addition to these sawmill enterprises, the Indians have carried on logging operations on their respective reservations.

FOREST DISEASE AND FIRE PROTECTION

The white pine blister rust continues to be a problem on Indian lands in the Lake States area. During the past year control work was done on 7,580 acres, in cooperation with the Bureau of Entomology and Plant Quarantine, Department of Agriculture. Indian women did much of the work.

The pine bark beetle caused some loss of ponderosa pine timber on Indian lands in the Western States last year. No control work was done because of the war. It is planned, however, as a post-war project, to do as much control work as conditions may warrant.

Fire protection on Indian forest and range lands continues to be a serious problem on account of limited funds and personnel. During the year, 976 fires burned over 166,058 acres of these lands, but none was excessively destructive, owing to favorable weather conditions. The average cost for fire suppression was one-half cent an acre for the 36,425,700 acres under protection.

GRAZING

Approximately 38,956,000 acres of Indian forest and range lands were used last calendar year for grazing approximately 355,770 cattle, 79,140 horses, and 1,299,720 sheep and goats. Of this total area, about 30,365,000 acres are being used by Indians to graze their livestock, and the remainder is being used by non-Indian stockmen under approved grazing permits.

Estimates of the grazing capacity of the Indian range lands have been made, and on most reservations the stocking has been limited in keeping with such estimates. Some districts of the Navajo, Hopi, Papago, and a few of the smaller reservations in the Southwest, continue to present a difficult problem with regard to overstocking. In all instances the problem is complicated by the fact that the Indians concerned depend largely upon a livestock economy, and do not own sufficient range lands on which to graze the number of livestock needed to maintain themselves on a reasonable economic level. Efforts are being made to correct this situation, and some progress was achieved during the past year.

This estimate includes the total output of petroleum and its products, lead, zinc, copper, vanadium, helium, coal, tungsten, asbestos, manganese, gypsum, limestone, and marble.

The pine bark beetle caused some loss of ponderosa pine timber on Indian lands in the Western States last year. No control work was done because of the war. It is planned, however, as a post-war project, to do as much control work as conditions may warrant.

Fire protection on Indian forest and range lands continues to be a serious problem on account of limited funds and personnel. During the year, 976 fires burned over 166,058 acres of these lands, but none was excessively destructive, owing to favorable weather conditions. The average cost for fire presuppression was one-half cent an acre for the 36,425,700 acres under protection.

GRAZING

Approximately 38,956,000 acres of Indian forest and range lands were used last calendar year for grazing approximately 355,770 cattle, 79,140 horses, and 1,299,720 sheep and goats. Of this total area, about 30,365,000 acres are being used by Indians to graze their livestock, and the remainder is being used by non-Indian stockmen under approved grazing permits.

Estimates of the grazing capacity of the Indian range lands have been made, and on most reservations the stocking has been limited in keeping with such estimates. Some districts of the Navajo, Hopi, Papago, and a few of the smaller reservations in the Southwest, continue to present a difficult problem with regard to overstocking. In all instances the problem is complicated by the fact that the Indians concerned depend largely upon a livestock economy, and do not own sufficient range lands on which to graze the number of livestock needed to maintain themselves on a reasonable economic level. Efforts are being made to correct this situation, and some progress was achieved during the past year.

FISH AND WILDLIFE MANAGEMENT

The management of fish and wildlife resources on Indian lands was given considerable attention. The Fish and Wildlife Service has conducted special investigations on several reservations and has assisted in encouraging the Indians to adopt ordinances for the regulation of hunting, fishing, and trapping. The fish hatchery on the Fort Apache Reservation, Ariz., was successfully operated, and supplied fish for planting streams in that area. Fish from other sources were planted in waters on other Indian reservations.

ROAD BUILDING AND MAINTENANCE

Modern society cannot exist without adequate transportation. The roads constructed on Indian reservations during the last decade have contributed greatly to the ability of the Indians to expand their food production for war use. During the present emergency period, ordinary road activities are restricted to maintenance. The fact that construction organizations were equipped and available at the various reservations made it possible for the Indian Service to undertake the building of access roads to sources of raw materials, a program involving a cost of approximately 1 million dollars. This work is continuing. These access roads will be useful in the marketing of mineral and forest materials after the war.

Plans are being formulated for post-war construction to continue the development of reservation road systems, but a lack of funds has thus far prevented the making of field surveys and the preparations of blue prints and specifications. This is an essential step in meeting post-war responsibilities.

EDUCATION CONTRIBUTES TO WAR NEEDS

The mobilization of Indian resources, energy, and skills for the needs of the world conflict, has carried over into the educational realm with gratifying results. The effectiveness of the training offered in the Indian vocational schools, throughout the decade just ended, has been demonstrated by the rapid advancement of vocational school graduates to noncommissioned and technical grades in the armed forces, and by the large number of young men and women who have been employed in war work demanding high manual skill.

The great exodus of Indian families has reduced the number of students in both the elementary day schools and high schools by 2,200 from a total of 29,621 in the previous year. Although the total enrollment in Indian Service high schools has been reduced about 20 percent, as a result of the drafting and employment of older students, specialized training of a wide variety, which contributes to the success of the war, is being continued. Many high schools have given

courses in welding and metal work, suitable to the needs of the aircraft and shipbuilding industries.

The Navajo vocational schools have operated preinduction classes for illiterate and semiliterate Navajos, of whom there are a great many. Haskell Institute has offered special training for mature men in plant maintenance and engineering to replace younger employees of Indian schools, agencies, and hospitals, who have joined the armed forces. The commercial department at Haskell has found so great a demand for trained office workers in other branches of the Government that most of its students are now finding placement outside the Indian Service. Other schools have given special training for nursing and other especially needed skills.

Schools of the Indian Service are now planning the part they expect to play in the continued education and retraining of returning veterans under the provisions of the Servicemen's Readjustment Act; and Indian communities throughout the country have requested that we be equipped to undertake such training.

It is noteworthy that a considerable number of Indian students, granted Government loans for higher education, have continued or increased the payments on these loans since entering the armed forces, despite the legal moratorium they enjoy. The number of loan students, however, has been reduced from a previous maximum of 600 per year to 155.

INCREASING INTEREST IN EDUCATION

Increasing interest in education upon the part of Indians themselves has been evidenced by the fact that a number of tribal councils have passed compulsory education ordinances, and enforced such ordinances previously enacted but neglected.

The Navajo Tribal Council has called upon the Indian Service to provide additional schools, asserting that the Government is not carrying out its treaty agreement to supply a classroom and a teacher for each 30 Navajo children presented for enrollment. Also the Council has asked that a high priority be given in post-war planning to the additional boarding and day schools needed for 10,000 Navajo children not now enrolled in any school.

Indian communities have been encouraged to take an increasingly active part in planning for their school children and in outlining a program of post-war development for serving different age groups. The discussions which occurred during the year revealed an almost unanimous enthusiasm for the Federal school program in the closed reservations, to which it is now largely limited.

Research in Indian education has been supplemented by initiating a study of achievement in elementary and high schools, and it is hoped

that an initial report on the effectiveness of Indian schools in achieving their objectives may be presented within the coming year.

The annual Indian Service summer school, primarily for the in-service training of employees of the Education Division, has for the last 2 years been oriented towards war and post-war problems, encouraging a consideration of revised vocational curricula in the light of post-war needs. New teachers have found the summer school most effective as an introduction to the program of Indian education.

EXTENSION WORK

The diminution of Extension funds resulted during the year in the withdrawal of Extension positions on several reservations, such as Eastern Cherokee and Mississippi Choctaw. In such areas the day school teachers and vocational instructors attached to the schools undertook to carry on a program of advice and guidance in agriculture, stockraising, and home extension with the adult Indians. At the day schools on these and other reservations, the Education Division has assigned purebred sires to assist in improving the beef cattle, horses, and other livestock of the reservations. Several years ago, a decision to undertake the up-grading of dual purpose beef and dairy cattle at Eastern Cherokee led to the purchase for the day schools of registered brown Swiss bulls, whose offsprings are now affording better milk and more meat. At the day schools of the Pine Ridge and other Dakota reservations, purebred Morgan stallions are improving Indian cattle horses.

All Home Extension work on reservations with Federal schools is being handled by the day school teachers and housekeepers under the direction of the home economics teachers of the central vocational schools. Home economics equipment is made available for use by adults, and instruction is offered them in sewing, also in cooking by way of increasing their concern over the use of an adequate variety of nutritious foods within the home.

INDIAN ARTS AND CRAFTS

During the past year Indian craft centers have enjoyed a greater demand for craft products than at any previous time. While a great many of the younger craft workers have been away from the reservations, the earnest efforts of craft teachers and the sponsorship of co-operative producing and distributing centers have led, in many cases, to an actual increase in crafts produced and sold. For example, the Northern Plains Indians Crafts Association, which is the outlet for producer cooperatives among the Indian craft workers of the Montana and Wyoming reservations, increased its business from \$6,906.87 in the calendar year 1942, to \$11,135.30 in 1943.

During the same period of time, the sales of Alaskan native crafts increased from \$242,100.67 to \$420,201.18. The latter increase, however, was more a matter of higher prices than of quantity sold, owing to the patronage of American troops stationed in the Territory.

The foundation has been laid for a considerable expansion of craft production in all the major Indian areas after the war. Recently, the Indian Arts and Crafts Board has copyrighted trade-marks for the Navajo Crafts Guild, the Seminole Crafts, and Northern Plains Indians Crafts Association. Copyrights of trade-marks for other producing and marketing groups are pending.

INDIANS ORGANIZE FOR HEALTH

One of the more encouraging developments of the year has been the increasing participation of Indian communities in the health activities of the Indian Service. Health councils were organized by the Indians on a number of reservations, and these are now functioning with marked enthusiasm for the task confronting them. In one instance a salaried board of health, the membership of which is entirely Indian, has been established. Such councils, in collaboration with health personnel and the superintendent of the agency, formulate modern health programs, recommend health legislation to their communities, and assist in presenting approved health policies and practices to their people in such a way as to stimulate interest and win acceptance.

Numerous ordinances, providing for the control of communicable diseases, have been passed by the health councils and approved by the tribes. This democratic approach to Indian health problems is highly significant, and there are indications that the movement will spread to other reservations during the coming year.

SHORTAGE OF HEALTH PERSONNEL

The growing determination of Indians to do something about their own health problems is especially desirable in view of the critical shortage of health personnel. On January 1 of this year, there were 73 vacancies for full-time physicians, 27 for part-time physicians, and 188 for nurses. Some of these vacancies are filled by local temporary employment, so that, in most instances, the essential emergency services are still available.

Cadet Nurses are being assigned to Indian hospitals, with benefit to all concerned; and the facilities thus given to their training is a direct contribution to the war program. Arrangements have been completed for the affiliation of the new Tacoma Hospital with the School of Nursing at the University of Washington.

Indian technicians and orderlies are being trained by Indian Service physicians and nurses to take the places of those now serving in the armed forces and to relieve medical personnel for more important duties.

HEALTH SERVICES OF THE YEAR

Exact tabulation of health service statistics for the fiscal year has not been completed, but the trend has not varied greatly from that of the preceding year. At that time the 94 hospitals operated by the Indian Service in the States and Alaska had 3,255 beds available for general cases and 1,214 for tuberculosis; 40,184 patients were admitted to the general hospitals for a total of 968,993 hospital days, and in addition, there were 4,739 tuberculosis patients given 393,859 days care.

Considerable hospital care has been furnished to families of soldiers and sailors, in cooperation with the Maternal and Child Care Program of the Children's Bureau. The intensive campaign to control and eradicate trachoma has continued, and during the year 2,232 cases were reported by the hospitals. The Bacillus Calmette Guerin or B. C. G. vaccination research project for the control of tuberculosis was carried on under extreme difficulties; but progress continued, and several reservations have reported 100 percent of known cases hospitalized.

Health conditions in Alaska, emphasized by the presence of war workers and the military, have been of great concern. At the close of the fiscal year, the Congress approved the transfer of a 150-bed hospital at Skagway from the Army to the Indian Service. If the necessary personnel can be obtained, the operation of this facility will contribute in large measure to the control of tuberculosis among a highly susceptible people.

The most notable innovation by the Indian health service during the year was the beginning of a complete analysis of vital statistics to determine accurately the Indian population served, birth and death rates, age distribution, causes of death and of morbidity, hospital utilization, economic status with its many implications, and other matters necessary for efficient employment of funds and efforts. When the analysis is completed it should prove of great practical value to the various branches of the Indian Service.

WELFARE ACTIVITIES

Especial emphasis was placed upon a more constructive welfare program, beginning with aid to adult Indians in taking advantage of opportunities offered by the defense industries, and featuring preventive and protective care for children, adolescents, the aged, and the incapacitated. Perhaps the greatest advancement in relief work

during the past year has been in the substitution of cash assistance for rations.

There has been a continuing effort to gain full recognition of the Indians as citizens of their home counties and States, with the responsibilities as well as the privileges of other citizens. It is good to note that the State of Colorado, on January 1 last, began issuing assistance under the Social Security Act to needy Indians of the Consolidated Ute Reservation. Efforts are being made to have the Sac and Fox Indians of Iowa included in the State aid to dependent children program.

As throughout the Nation, there has been a considerable increase in juvenile delinquency, and in other problems traceable to faulty adjustments away from home, as well as in families disrupted by the absence of the father. Our program is planned to meet such situations, continuing to stress adequate aid for the needy, wholesome recreation for the whole family, and particularly for adolescents. Careful attention is being given to the needs of returning servicemen and defense workers.

AWARDS OF EXCELLENCE

Four Indian Service employees, Mr. and Mrs. C. Foster Jones and Mr. and Mrs. Charles Ralph Magee, received awards of excellence and meritorious promotions voted by the Interior Department's Board of Suggestions. Mr. and Mrs. Jones, radio operator and teacher, respectively, on the island of Attu in the Aleutians, remained courageously at their posts after war was declared; and when Attu was taken by the Japanese in June 1942 they either became prisoners of war or lost their lives resisting the enemy. When Attu was retaken no trace of them was found and no word has been received from them, but it is hoped that they are alive and will return to their work after the war is over. Mr. and Mrs. Magee, holding similar positions on Atka, managed by heroic measures to evacuate the population of the island without loss just before the arrival of the Japanese, and they accompanied the Aleuts to temporary homes on the mainland.

HOONAH VILLAGE BURNED

Fire broke out in Hoonah Village, Alaska, on the evening of June 14, when, according to reports, an Indian woman who was drying fish in a little stilt-supported house threw gasoline on the embers of her fire. A high wind spread the flames rapidly and about 70 percent of the village was destroyed, leaving 350 persons homeless. One man lost his life. Coast Guard officers flew to the scene, and the Army, at the request of Indian Service officials, evacuated many of the homeless to Excursion Inlet, where barracks were available for

temporary shelter. The Red Cross, through the Sitka, Juneau, and Kechikan chapters, sent food and blankets. Planning was begun at once by the Indian Service, in cooperation with other Government agencies and the Army, for rebuilding and resettling the village.

TRIBAL CLAIMS

One of the important objectives to be obtained in the post-war period is the early settlement of Indian tribal claims against the United States, which, for patriotic reasons, have not been pressed during the war.

The Indians look forward to the settlement of their claims as a means for their economic advancement in the post-war period. The proceeds from favorable judgments will be used largely to acquire additional needed land, to build homes, and to develop land enterprises. Consonant with this plan, legislation has been enacted to enable the Menominee Indians to acquire reservation lands in Wisconsin from the proceeds of the judgment rendered by the United States Court of Claims last February. Negotiations are being made for settlement of the claims of the California Indians by an appropriation to be used during the post-war period for the economic advancement of these Indians.

The establishment of an Indian Claims Commission would relieve the Congress of the burden of considering each claim at a time when other matters of great moment will require attention. Also, such a commission would relieve the Court of Claims at a time when doubtless it will be overburdened with litigation. The Indian office has urged the creation of such a commission, and will continue to do so.

INTER-AMERICAN ACTIVITIES

In Mexico City, on April 18, 1944, the governing board of the Inter-American Institute of the Indian held its annual meeting, exactly 4 years after the first great Congress of the Indians at Patzcuaro, Mexico. Twelve republics have now united themselves with the Institute through treaty. They are: Mexico, El Salvador, Panama, Honduras, Nicaragua, Ecuador, Colombia, Peru, Costa Rica, Paraguay, the Dominican Republic, and the United States. Others are preparing to join in the movement. At the annual meeting, particular attention was given to the project of the National Indian Institutes of Panama, Nicaragua, and Ecuador, cooperating through the Inter-American Institute with the National Indian Institute of the United States, for the establishment of health work at the subprofessional level. This project includes a study of the feasibility of uniting modern health work with the work of native medicine men, and the organization of subprofessional health services in the necessary absence of a sufficient supply of doctors and nurses.

Attention was given, also, to the Indian personality project, carried out under the Inter-American Institute in Mexico. This project has been successful in using the services of many types of professional and lay workers, including Indians, and promises to be deeply revealing on both the administrative and psychological levels. It is an integrative study, paralleling that now going forward in our own Indian Service.

On Indian Day, the purposes and hopes of the Institute were broadcast throughout Mexico, Central America, and northern South America, through speeches by Dr. Manuel Gamio, Director of the Institute, Senor Isidro Candia, the Director of the Indian Service of Mexico, and Commissioner Collier, who had been reelected as chairman of the governing board.

MISSION TO EL SALVADOR

During his visit to El Salvador last summer, Mr. Ernest E. Maes, Secretary of the National Indian Institute, was much impressed with the program set up there by the Confederation of Rural Credit Funds. As our Indian Service has been greatly interested in developing a self-liquidating agricultural system for Indian farmers, Mr. Maes felt that someone should be sent to El Salvador for the purpose of studying the program there in operation.

Mr. David C. Dozier, a young Santa Clara Pueblo Indian employed at the United Pueblos Agency in Albuquerque, was chosen for the mission, which he performed during February with profit to all concerned. In sending Mr. Dozier on this mission, the National Indian Institute was fulfilling its function of developing collaboration among Latin-American countries and our own country in the solution of Indian problems.

LOOKING TO THE FUTURE

The fiscal year 1943 marked the end of 11 years during which there had been a tremendous release of long-dormant Indian energy, a vigorous functioning of inherent Indian democracy, and a rebuilding of the shrunken Indian landed estate. It was necessary to know how much progress Indians had made during those 10 years in the direction of democratic self-control and economic self-sufficiency, and what might best be done to safeguard and improve Indian organization and economy for the trying test of the post-war period.

For 2 years research, designed in its end result to criticize and implement policy and administration in Indian Service, has gone forward in 11 contrasting communities in 5 contrasting tribes. The Committee on Human Development, of the University of Chicago, and specialists from a number of other institutions, have contributed indispensably. These studies have used integratively the instruments

of discovery of anthropology, psychology, ecology, and so on. The initial results are now in process of publication or ready for publication. Information acquired by these studies and the practical experience of Indian Service administrators, augmented by consultation with experts in personnel and public administration, will be made available in the coming months to produce critiques of Indian administration which will well may prove far reaching and practicable for the better administration of native groups.

These intensive researches and their practical utilization are concurrent with the production, service-wide but less intensive, of practically based post-war plans by the Service personnel and the Indians in all jurisdictions of the Service. Early in the fiscal year 1946 Indians and field employees were requested to review past accomplishments and present conditions; to analyze the social, economic, political, and administrative problems of each tribe or group; and on the basis of such an analysis to consider the future relations of the tribe or group to the Federal Government, to the States and Territories, and to the non-Indian population.

It was realized that the basic resources of nearly all tribes were inadequate; that the enlargement of resources and their effective utilization by Indians presented many difficult problems; and that the formation of the reorganized tribes as civic or corporate bodies was a matter of much improvement.

In response to this call of a year ago for the gathering and interpretation of facts, opinions, and suggestions, 64 detailed proposed post-war programs, dealing with the problems of 120 tribes and groups, have been submitted. These proposed programs are now being carefully analyzed and revised. Upon approval in the proper forms, they will serve as maps whereby the Indian tribes and groups concerned, in cooperation with the Department and with the aid of the Congress, can determine definite courses which will lead to the common goal of self-sufficiency and harmonious integration with the national life.

Division of Territories And Island Possessions

BENJAMIN W. THORON, Director

THE magnificent accomplishments of the armed forces in freeing Alaska of the Japanese invaders, relieving Hawaii of the probability of attack, and virtually clearing the Caribbean area of the submarine menace, point to the necessity for developing a post-war program by the Division of Territories and Island Possessions. It has, however, been unable to make much progress because of the reduction of its appropriation necessitating reduction in staff at a time when many new problems must be met. The action of Congress in still further reducing the 1945 budget leaves the Division in a desperate situation.

The Division of Territories has been keenly aware that the position of Alaska is one of national strategic importance. Public interest has been greatly stimulated as a result of war activities, the building of the Alaska Highway, and various articles in the press and magazines. As a consequence, inquiries from servicemen and civilians relative to post-war opportunities have flooded the Division. In cooperation with the General Land Office and other bureaus an effort has been made to supply information that is factual and will be helpful to settlers desiring to build their future on the new frontier. The development of an Alaskan program by coordinating the work of the various bureaus within the Department is essential and the Division has tried to make a start on this. Hospitals for the treatment of tuberculosis among both white and native populations are urgently needed. Negotiations are now under way to have the military facilities which are no longer considered necessary for the treatment of war casualties, transferred for the use of the civilian population. The disposition of other surplus military property and equipment to Federal and territorial civilian agencies can be of great permanent value, where its sale

to dealers and speculators for cash as salvage will lead to much greater Federal expenditure in the future.

The Alaska Railroad continues to do heavy duty for military and civilian needs. In spite of manpower shortages and difficulty in securing equipment, every effort has been made to improve the roadbed, bridges, and rolling stock. The Division has worked in close cooperation with the War Manpower Commission and the War Department to recruit help, and with the Office of Defense Transportation and the War Production Board to secure priorities for materials and equipment.

Since the changed military situation in Alaska during the summer of 1943, the need for governmental stockpiles of food for civilians no longer exists. Liquidation of these stocks has been proceeding in an orderly and businesslike manner, through sales to the trade, other agencies, and to the Army and Navy, and is rapidly nearing completion.

The Morningside Hospital at Portland, Oreg., where insane residents of Alaska are cared for, was inspected, and conditions were found to be satisfactory.

The position of Hawaii has changed from a defense outpost to a base for offense. As a springboard for the South Pacific, it still has all of the problems of a war theater. Civilians feel the pinch of housing and shipping shortages. Although martial law remained in force, conferences were held between this Department and the War, Navy, and Justice Departments, looking to the complete restoration of civil affairs to civil authorities and some relaxations of military controls were obtained. The validity of the trial of civilians by provost courts was challenged in the Federal District Court. Both Federal judges ruled against the military, and appeals were taken to the Circuit Court of Appeals at San Francisco, but had not been argued by the end of the year.¹

The Division, working in cooperation with the Hawaiian Housing Authority, was successful in securing an interim housing program providing for 250 publicly financed dwelling units and 500 privately financed dwelling units. This allotment was predicated largely on the availability of manpower and matériel. While it does not begin to meet the need, we hope that a more extensive program may be undertaken in the coming year. The Territorial Office of Civilian Defense, which has done an outstanding job in instructing civilians in all phases of defense activities, has discontinued many of its branches. However, it maintains a skeleton force and its employees, both paid and voluntary, demonstrated their training in a recent serious explosion and plane crash. By rigid control of expenditures it still

¹ By proclamation of the President dated October 19, 1944, martial law was terminated and the privilege of the writ of habeas corpus was restored, effective October 24, 1944.

retained a sufficient balance of the appropriation made in January 1942 to carry through the 1945 fiscal year.

Of outstanding interest and importance to the possible future relationship between Puerto Rico and the continental United States was the meeting of the President's Advisory Committee to draft recommendations for revising the Island's Organic Act with a view to granting to the people an increased measure of control over their local affairs, including the popular election of their Governor. The committee consisting of four Puerto Ricans and four continentals under the chairmanship of the Secretary of the Interior met in Washington for 3 weeks in July and August and drafted a bill providing for election of the Governor by the people, appointment of the justices of the Supreme Court and of all department heads by the Governor, together with other amendments to the Organic Act consistent with these provisions and increasing local self-government. The bill was transmitted by the President to Congress. It passed the Senate with numerous amendments, but has not yet been taken up by the Insular Affairs Committee of the House of Representatives.

The Civilian Food Reserve unit of the Division of Territories, working with the Office of Distribution of the War Food Administration, during the year procured and shipped to Puerto Rico and to the Virgin Islands a total of 479,715 tons of foodstuffs, feeds, and fertilizers. There were ample supplies of basic commodities and the prices during the year were stabilized in a very satisfactory manner.

In line with our expressed policy after discussion with our Trade Advisory Committee, 41 food and feed commodities, involving approximately 8,000 tons monthly, were returned from governmental procurement to the regular trade channels. The return of additional commodities is being made as rapidly as there is assurance that adequate supplies can be maintained at reasonable prices.

While shipping to Puerto Rico was still severely restricted, the supply situation was met satisfactorily, considering the prevailing wartime conditions, through the continuance of governmental control of shipping space as described in last year's report.

The complete lack of war industries in Puerto Rico, the cessation of military construction, a severe drought that reduced sugar production materially, and the discontinuance of the work relief program of the Federal Works Agency all aggravated the Island's unemployment problem. The Insular Government immediately appropriated funds for direct and work relief. Induction into the armed services of more than 25,000 men also helped to relieve conditions. The Division assisted in working out plans in conjunction with the War Manpower Commission and the Governor's office to bring several thousand Puerto Ricans to the mainland to relieve the manpower shortage in war industries. The War Manpower Commission did not obtain the neces-

sary appropriation to finance their transportation, but over 2,500 Puerto Ricans have come, some paying their own way and seeking employment individually, others transported at the expense of employers who contracted for their services through the War Manpower Commission.

Steady progress is being made by the Puerto Rico Development Co. in the introduction of new industries to supplement the Island's agricultural economy. Private interests are constructing a coconut fiber bag plant, and a leather goods manufacturer has begun operations in the west end of the Island. Continental industrialists are showing increased interest in the Island. The Division and the Development Co. have not only aided those firms which have begun operations in the past year but have encouraged those who are looking to the Island as a possible post-war base for branch plants in which to manufacture goods for South and Central American trade.

During the year the President issued an Executive order which places on the Secretary of the Interior responsibility for coordinating the policies and activities of all Federal civil agencies in Puerto Rico and the Virgin Islands. Most of the agencies have cooperated effectively with the Division of Territories with a resultant improvement in the services provided in the Islands. The reduced appropriation for personnel in the Division has made it impossible to make this coordination fully effective.

In the fiscal year full or partial settlements have been received or agreements reached in 530 cases of hurricane relief loans, with collections totaling \$135,835.05, as compared with a total of 852 adjusted in the preceding 4 years. New procedures have been instituted to expedite the settlement of these loans. Small debts of farmers living in isolated mountain areas have been handled expeditiously through the Agricultural Extension Service of the University of Puerto Rico.

The need for molasses for munitions production made it necessary for the War Production Board to establish quotas for the importation of beverage cane spirits from foreign countries and for the production of the same product in American Caribbean possessions. The Division energetically presented the case for Puerto Rico and the Virgin Islands at conferences of the interested agencies. The resulting quotas, while not fully satisfactory, have permitted the operation of the distilling industry in these islands at something less than 50 percent of capacity. The effect on the revenues and employment will be very noticeable in the coming fiscal year unless the restrictions are removed.

The failure of Congress to appropriate the salary of a Government Secretary for the Virgin Islands, upon which office the Governor's duties devolve in his absence, resulted in that position remaining vacant from the time of the resignation of Robert Morss Lovett. This has resulted in an enormous burden on the small administrative staff

of the Virgin Islands Government and the restoration of this position is essential. After the Federal Works Agency work program was liquidated at the end of November 1943, a bill was introduced in Congress containing a program of specified public works. Hearings have been held by the House Committee on Insular Affairs but no further action has been taken.

The Virgin Islands Co. enjoyed a prosperous year. The Bethlehem sugar factory, which had been rehabilitated with Public Works Administration funds, was put in full operation for the first time in 14 years and 33,200 tons of sugarcane were ground. It is expected that the operation of this mill will bring about increased cane planting and so add to the income of the small farmers of the islands.

As a result of the responsibility of the Department for matters affecting Puerto Rico and the Virgin Islands, the Division has participated actively in the work of the Anglo-American Caribbean Commission. Puerto Rico and the Virgin Islands were represented by their own delegates at the first West Indian Conference held at Barbados, March 21-30. The Director also attended as an adviser to the American Commissioners. The interchange of information and ideas among the people and officials of the various islands may well lead to a better understanding of the community of their problems and to trade relationships that will be extremely beneficial to the whole area.

Although the Philippines are still under enemy control, concern for their future is evidenced by the approval in November 1943 of a bill relating to their rehabilitation, a joint resolution of Congress relative to the establishment of an independent government after the enemy has been driven out and the approval of a joint rehabilitation commission to study and make recommendations on post-war problems. Certain fiscal responsibilities continued to be exercised by the Division, but because of the failure of Congress to appropriate funds it was not possible to make any constructive preparation for the time when the Commonwealth Government returns to the islands.

A more detailed report of activities in each area follows:

TERRITORY OF ALASKA

Although the last Japanese on Alaskan soil was exterminated or had fled in the summer of 1943, Alaska still retained on June 30, 1944, its status as a combat area. What military activity there was, however, had been transferred to the Aleutian chain. Civilian travel control, censorship, and other military restrictions still remained.

Recognition of the present and future military importance of Alaska has come with the establishment by the Army of the Alaskan Department to supersede the former Alaska Defense Command, commanded from San Francisco, and establishment by the Navy of the Seventeenth

Naval District to supersede the Alaska Sector of the Thirteenth Naval District, commanded from Seattle. Both of these new commands have their headquarters in Alaska.

A similar recognition of Alaska's importance and of its special character in a different field—and one of the greatest economic importance—came with the establishment of the Territory as region 6 of the Fish and Wildlife Service under its own Regional Director with headquarters at Juneau. Under the Regional Director, a fishery management supervisor and a game management supervisor superintend the vast natural resources in their respective fields.

The establishment of an Alaska regional office in Anchorage of the Civil Aeronautics Board is likewise a recognition of the great importance and potential growth of civil aviation in the Territory.

In the War-bond drive Alaska maintained its record of surpassing its quotas and of leading the Nation. In the Fourth War Loan, Alaska raised 202 percent of its quota. In second place was the other Pacific Territory, Hawaii, with 175 percent. This record is all the more striking since, while Alaska was the only political entity to subscribe more than double its quota, only two States exceeded their quotas by as much as 50 percent.

Although the Territory had made no provision up to the end of the fiscal year for a planning or development commission to formulate a post-war construction program, both to meet the Territory's needs and to provide for the returning veterans, a start has been made by the Governor's office which has requested individual communities to study their needs and to submit desired projects with approximate cost estimates. To date requests for projects totaling \$23,050,500 have been received from the following Alaska towns: Anchorage, Craig, Cordova, Douglas, Fairbanks, Haines, Juneau, Kodiak, Ketchikan, Nome, Petersburg, Sitka, Skagway, Seward, Unalaska, Valdez, Wrangell, and Whittier. Estimated costs for post-war projects submitted thus far by Territorial and Federal agencies total \$36,434,625. These estimates have been submitted by The Alaska Railroad, the Alaska Road Commission, the Forest Service, the Fish and Wildlife Service, the Office of Indian Affairs, the Public Roads Administration, the Territorial Department of Education, the Territorial Department of Health, the University of Alaska, the Department of Justice and the Post Office Department. Post-war planning for Alaska is, however, far behind what it should be, especially in comparison with other political units—virtually every State in the Union having long since established its planning and development commissions.

While war continues to be, in Alaska, as elsewhere under the flag, the overshadowing fact, Alaskans have in the last year become acutely and increasingly aware of another insidious enemy within. It is the "White Plague." The incidence of tuberculosis has long been high in

Alaska, approximately twice that in the 48 States, with correspondingly high mortality. Apparently the disease is on the increase. The last, the Sixteenth Territorial Legislature was the first to indicate the awakening local interest in this peril by appropriating \$25,000 for the Territorial Department of Health for the hospitalization of tubercular patients. But since the health authorities estimate that there are at least 2,000 active cases in the Territory that require hospitalization—for only 5 percent of which hospital beds are available—this is only “a drop in the bucket.” Efforts during the last year to secure the construction with Federal funds of additional hospitals for tuberculosis have failed, because new construction requires military endorsement. Attempts to secure from the Alaskan Department of the Army one or more of the various new hospitals constructed for war purposes and closed as the military situation changed and the war moved westward, were likewise unsuccessful. Fortunately, however, the Northwest Service Command, which had jurisdiction over a small portion of southeastern Alaska, took a different attitude and was agreeable to the transfer of the abandoned military hospital at Skagway for the purpose. At the close of the fiscal year authority was obtained for the transfer of that hospital to this Department and an appropriation was made by Congress to finance the operation of the hospital for native tuberculosis patients, at least until the next Territorial Legislature, convening in 1945, could determine its desires and responsibilities in the matter, and make provision for operation of the hospital for all civilian tuberculosis sufferers.

THE ALASKA ROAD COMMISSION

The Alaska Road Commission has worked under difficulties due to shortage of labor and equipment but it has succeeded in keeping the main highways in passable condition to meet civilian as well as military traffic demands. The Glenn Highway was kept open throughout the winter. Maintenance work on the Alaska portion of the Alaska Highway was transferred from the Army to the Road Commission at the close of the year.

Reconstruction and improvement work on the Richardson Highway, necessary to make it suitable for the heavy truck traffic to which it was subjected was continued to the limit of available funds. Several new steel spans were substituted for weak and inadequate wooden bridges and trestles. No new mileage was constructed.

ALASKA RURAL REHABILITATION CORPORATION

The Matanuska Valley project has shown notable improvement. The total area of cleared land is over 6,000 acres, of which 4,000 are in cultivation. The Army and increased civilian population of central Alaska have created good markets for all products of the valley.

The farmer's cooperative is now supplying all of the fresh milk cream used in Anchorage and is in sound financial condition. Several of the original colonists have paid their indebtedness in full. Repayments generally are more satisfactory than formerly. With approval of the Secretary of the Interior, the Board of Directors is to eliminate all restrictions contained in land contracts when final payment is received and to issue fee simple deeds. Several tracts reclaimed by or repossessed from original purchasers have been sold to settlers. The Matanuska Colony is well on the road to becoming a thriving community of hard working, successful farmers and stock makers, fully justifying the sponsorship of the project by the Federal Government. Agricultural development in the Kenai Peninsula and in the Tanana Valley is also showing progress.

THE ALASKA RAILROAD

Operations of the Alaska Railroad were the most successful in its history. For the second successive year, the volume of both freight and passenger traffic exceeded all previous records. Net tonnage and revenue freight carried were more than four and one-half times the volume in 1939, and passenger miles were more than twice the volume in 1939, the last year before war activities affected transportation.

Shortage of skilled manpower continued as the most serious operating problem throughout the year. The Railway Operating Battalion loaned by the War Department on a reimbursable basis, continued to render valuable assistance throughout the year. Nevertheless, the railroad was handicapped by a continuing shortage of qualified personnel, especially in its repair shops at Anchorage. Strong efforts were continued throughout the year, with assistance of the Alaska Department of the Army and the United States Employment Service to recruit civilian personnel in the States. The results of these activities have been only partially successful. A comparable situation prevailed in Alaska's coal mines. However, the Eskimo operated by the railroad, produced 67,300 tons of coal.

New construction included an addition to the Anchorage engine house, a new engine house at Fairbanks, and extensions to sidings at a number of stations, totaling approximately 13,000 feet. An extensive tie renewal program was carried on throughout the year and extensive ballasting was undertaken on the Whittier line and at other points. Efforts to improve the standard of maintenance were, however, limited by shortage of manpower.

To provide adequate wartime transportation it was necessary to purchase much additional rolling stock and equipment, most of which unfortunately had to be second-hand.

The Whittier Cut-Off has been in full operation throughout the year with the result that the railroad has been able to handle a large

increase in the volume of freight traffic without a corresponding increase in existing equipment and with approximately the same number of employees. Two new Diesel locomotives were purchased for operation on the Anchorage-Whittier line in lieu of providing forced draft ventilating systems in the tunnels necessary for operation of steam locomotives. Many of the terminal facilities at Whittier were completed and turned over to the railroad for operation.

River boat service on the Yukon and Tanana Rivers was maintained throughout the summer season. The river fleet was augmented by the transfer from the War Department of the steamer *Barry K*, and the loan of two barges. Also a new 300-ton barge was completed and placed in service. The amount of river freight handled increased approximately 10 percent, totaling 15,412 tons.

The McKinley Park Hotel was not operated by the railroad, as it has been turned over to the Army for the duration of the war as a recreation center for the Alaskan Department. Groups of officers and men from outlying posts are given the opportunity of spending a week's leave at the park.

TERRITORY OF HAWAII

During the fiscal year Hawaii continued to accommodate all of its governmental and its commercial and industrial facilities to the maintenance of internal security and to the military effort centered in these islands. Planning for the future necessarily has been subordinated, but it has not been neglected.

The Governor established a post-war planning division of the Department of Public Works and an advisory board to assist this division. This agency is coordinating all other local efforts to formulate plans and policies involving the development of Hawaii's natural and human resources and the expansion of its facilities to the highest attainable degree of usefulness to itself and to the Nation.

The operating experience of agencies created under the Governor's emergency powers to meet war-created problems has provided a record which should be of great value in establishing future legislative policies. Citizens, trained as wardens and as auxiliary police and fire-fighters and defense corps, are unified and alert to the requirements of community safety.

The problems which have had to be surmounted in connection with the control and development of food production and importation, and the procurement locally and from the mainland of other essential civilian commodities, have emphasized our dependence upon regular trans-Pacific shipping facilities and the necessity for future expansion of local production for local use.

Widespread development of community interest in mosquito and rodent control and in other public health security measures fostered

by the various territorial, Federal and municipal agencies involved, will pay dividends for years to come. Dengue fever, which became epidemic about the beginning of the fiscal year, was under control at its end. The disease was probably brought here from the western Pacific, which emphasizes the necessity for the intensification of protective measures (including embargoes against and quarantine of animals) designed to prevent airborne passenger and freight transport from bringing to Hawaii or to the continent human or other diseases which are prevalent in areas to our west.

Two new public health centers, constructed with Federal funds, were opened during the year. Lanham Act funds also helped to provide additions to Hawaii's general and mental hospitalization facilities. At least one of the hospitals established as part of the emergency medical service will remain as a community asset at the end of the war. Plans exist to continue the emergency blood bank on a permanent basis. Compulsory "booster" injections of typhoid vaccine, the second since Pearl Harbor, provided immunization which should tend to keep down this disease in the future.

Construction had started on two new refuse incinerators in Honolulu, partly financed with Federal funds, and the municipal government was in the midst of a survey of sewerage requirements which should, prior to the war's end, produce final plans for the complete sewerage of Hawaii's capital city.

Some progress was made toward solution of the continuing acute housing problem and efforts are continuing. All agencies concerned are endeavoring to tie in relief of current conditions with post-war plans for slum clearance and orderly community development.

All major territorial seaports and harbor facilities and all airports continue to be operated under the direction of the military authorities, but payment for the use of territorial wharves is now being made by the Army and Navy. Extensive reconstruction and repair of harbor facilities will be necessary at the war's end. Substantial improvements have been made to major airports by the armed forces. Plans for continuation of these improvements are being prepared. Highway maintenance; i. e., prevention of total disintegration, continued to be a major problem and reconstruction will afford a major source of post-war employment if efforts to secure war damage reimbursement are successful. The Territorial government urges strongly that since the deterioration of the highways is due to their use by vehicles of the armed forces of a weight and character for which they were not built, those services should be obliged to finance their reconstruction. New construction, except for the Pearl Harbor Road, was confined to military access roads financed by Federal funds.

Large park and other recreational areas are still devoted to active military use. Plans are ready for coordinating the extensive restora-

tion work which will be necessary with further improvement and extension of these areas.

Hawaii's teen-age citizens again cheerfully assisted in the production of its vital crops. Retail and other business remained at a relatively high level in spite of acute manpower shortages and continued curtailment of shipping space. Tax collections, both Federal and local, and bank deposits and postal receipts increased over the previous year. Territorial and county bonded indebtedness is being reduced, which will increase post-war borrowing capacity. Previously established rationing and price control procedures continued to be effective. Control of commercial rents was effected by a Defense Act rule.

Territorial, municipal, and Federal departments and agencies, as well as the post-war planning division and certain committees, are formulating plans for the reassimilation into Hawaii's economy of her returning servicemen.

Administration of Hawaii's civilian affairs by civilian agencies, existing under the authority of law, was further extended during the year.

PUERTO RICO

The year has seen the tides of war recede from Puerto Rico but the effects of the crucial danger period of 1942 are still noticeable. In spite of this it is not possible to relax in vigilance as Puerto Rico's life blood flows through arteries of ships. So long as the war is on, the possibility of the diversion of ships for our invasion needs or of a final desperate attempt by the enemy to destroy our commerce through a renewed submarine campaign, necessitates Puerto Rican preparedness to keep its people from starvation.

Unlike the continental United States, the war has brought little benefit to the people of Puerto Rico with the exception of increased revenues from rum. Even this has been a mixed blessing as it has been used as a reason for reducing Federal aid to the Island and for proposals to change the fiscal relationships that have existed for over 40 years. The Federal Works Agency liquidated its work relief program on the island on November 30, 1943, and the Insular War Emergency program financed by these internal-revenue taxes carried on the task of providing work for the island's unemployed. Military construction dwindled during the year until at the present time there is virtually none. The unemployment created by the completion of this work has been partially offset by increased inductions into the armed services, although the benefits do not always go to the same families. The short sugar crop of this year meant less work for many thousands of workers. No war industries are located in Puerto Rico although plans are being formulated to utilize the needle-work trades in the manufacture of garments for the liberated peoples of

the world under the United Nations Relief and Rehabilitation Administration program.

Keen interest is always displayed in politics in Puerto Rico, but with the approach of the elections in November, the battle cries of the opposing forces become almost deafening. The annual session of the insular legislature which started in February was unfruitful because of the impasse between the Senate and the Lower House, and only legislation of minor importance was passed. One very serious result of the deadlock was the failure to pass a bill appropriating additional funds for relief and work projects. This has led to litigation to test the applicability of section 34 of the Organic Act which provides for the automatic reenactment of appropriations in the event of a deadlock.

Puerto Rico has followed with passionate interest, the proceedings of both the Senate and House committees which are considering the proposed changes in the Organic Act.

AGRICULTURE

A prolonged and severe drought, the worst on record, had a serious effect on all crops. Sugar production, the biggest employer of labor, dropped from a normal of over 1,000,000 tons to 728,000 tons because of the previous year's fertilizer shortage and the drought. The Agricultural Adjustment Agency will make deficiency payments to growers for crop losses due to the drought. The quality and yield of tobacco were both adversely affected.

The effects of delayed and lost planting on many root and vegetable crops will be felt for some time to come. For a time this spring there was a relative shortage of locally grown vegetables and these were of an inferior quality.

INDUSTRY AND COMMERCE

The manner in which a limitation on the production of rum in Puerto Rico was imposed as a consideration to Cuba to make its molasses available for industrial alcohol production created a very bad impression in Puerto Rico. Although recent partial relaxation of the limitation similar to that granted Cuba at the same time has helped to relieve this situation, almost the entire quota for the calendar year had been produced by midsummer and the resulting unemployment and loss of revenue for the fiscal year 1945 are viewed with alarm.

Slow but steady progress is being made in the introduction of new industries. The glass plant, under construction by a subsidiary of the Puerto Rico Development Co., ran into unforeseeable wartime delays but is now rapidly nearing completion. The ceramics plant is functioning well and plans are formulated for expanding its operations into other types of clay products. Construction of the

paperboard factory has been started and plans are virtually complete for the wallboard mill. A proposed spinning and weaving mill for coarse fabrics and sugar bags is still in the planning stage. Private interests are about ready to start operation of a coconut fiber bag plant which is being completed at Mayaguez and a leather goods manufacturer is now operating in Cabo Rojo.

While many types of consumer goods are either nonexistent or scarce, the variety and quantity of goods on merchant shelves has shown a steady increase. Generally, merchants have suffered little or no financial loss despite shortages of goods because of higher than normal profit margins.

LABOR

There has been considerable unrest in labor ranks this year, particularly in the sugar industry. The time lost in strikes, however, has not been higher than usual. The two principal unions are engaged in a struggle to determine which will be the bargaining agent for the sugar workers. The Insular Labor Relations Board with the assistance of technical advisers lent by the National Labor Relations Board has held hearings on the question of an election among the workers to settle the issue.

THE CONSUMER AND THE COST OF LIVING

The War Food Administration, the Department of the Interior, the War Shipping Administration, the Office of Price Administration and agencies of the insular government have effectively co-operated to see that Puerto Rico was supplied with its basic needs and that prices did not skyrocket. Wages have increased in Puerto Rico during the war period but have not kept pace with the increased costs of living. The purchasing power of the wage earner's dollar of March 1941 has dropped to 71 cents and on some items such as food and clothing to 66½ cents. However, virtually no change has occurred in the purchasing power of the dollar in over a year and further devaluation of the dollar has been successfully blocked.

The total dry cargo tonnage for civilian use received during the 12-month period ending June 30, 1944, was 875,839 short tons, compared with 636,330 short tons received during the 12-month period ending June 30, 1943.

In accordance with previously announced policy, the procurement of many types of foodstuffs as well as animal feeds has been returned to private channels as fast as supply conditions warranted. The transfer of responsibility in most instances was accomplished without serious disturbance of distribution. The increase in available shipping tonnage has also permitted the importation of numerous articles which were of a less essential nature but desired by the people to be resumed.

THE FUTURE

Undoubtedly, the rate of revenue that Puerto Rico has received from internal revenue taxes will decline appreciably as beverage alcohol production increases in the States. Plans have been made to use the surpluses now in the Treasury for the permanent benefit of economic and social conditions on the island. It has been impossible during the war to obtain the building materials and supplies to do the seriously needed work on schools, housing, sanitation and hospitals. Plans for all of these have been prepared and this work can start as soon as material is available.

THE VIRGIN ISLANDS

This year saw the application to the Virgin Islands, for the first time, of the Selective Training and Service Act of 1940. As this act was not heretofore applied to the Virgin Islands, registration of Virgin Islands youth for service in the armed forces of the United States was not accomplished until the President of the United States by proclamation dated October 26, 1943, directed the registration of all male citizens of the United States not previously registered. Registration of Virgin Islanders began in November 1943. The first induction call was made in June 1944. At the close of the fiscal year there were 2,185 registrants in the age group 18-44 under the jurisdiction of the St. Thomas local board and 1,475 under the jurisdiction of the St. Croix local board. In the first call for 200 inductees, 149 were supplied from St. Thomas and 62 from St. Croix, all of whom were volunteers for immediate induction.

The financial condition of both municipalities improved materially during the year, especially in the municipality of St. Thomas and St. John where income taxes yielded \$1,295,380.50 as compared with \$465,447.76 in the preceding fiscal year, an increase of 178.3 percent.

In the municipality of St. Croix income tax collections were \$114,836.45 as compared with \$46,977.22 in the preceding fiscal year, an increase of 144.45 percent. Total revenues of this municipality amounted to \$262,684.89 as compared with \$194,440.62 in the preceding year, an increase of 35 percent. This tremendous increase in revenue from income taxes is attributable primarily to the prosperity of the rum manufacturing business as well as the increased rates and lower exemptions.

The municipality of St. Thomas and St. John, with its surplus revenues, created a hospital building fund with a deposit of \$200,000; a high school building fund of \$50,000; a sewer system fund of \$150,000; a reserve fund of \$100,000; and a scholarship fund of \$10,000. Almost \$300,000 of these funds were invested in War Savings bonds. In spite of increased revenues the municipality of St. Croix still re-

quired a congressional appropriation to meet the deficit in its treasury, even though municipal services have continued at a minimum.

The withdrawal of the Work Projects Administration of the Federal Works Agency from the Virgin Islands in December 1943 left a considerable number of unfinished projects. It also eliminated relief employment for approximately 1,500 persons. Projects for nursery schools, school lunches, sewing, health, and vegetable growing projects, formerly operated by the Work Projects Administration, were taken over and operated by the Municipal Governments from December 1943 to June 1944. With the curtailment of employment on defense construction projects in St. Thomas during the closing months of the fiscal year, unemployment conditions were accentuated. In St. Croix there was considerable unemployment until the Virgin Islands Co. opened the cane harvesting season late in February which continued well into the month of May. It is estimated that there are at the present time between 1,500 and 2,000 unemployed employables in the Virgin Islands. For a small portion of these, employment will be provided on municipal projects made possible by the increase in income taxes on largely increased distilleries' profits.

Legislation was introduced in Congress for extension to the Virgin Islands of the benefits of those titles of the Social Security Act providing for old-age assistance, aid to dependent children, aid to the blind, maternal and child welfare and public-health work. As American citizens, Virgin Islanders should share equally with continental citizens in the benefits of this act. Certainly there are few spots under the American flag which so desperately need these aids. No action has been taken on this bill beyond hearings held by a subcommittee of the Senate Finance Committee.

The Agricultural Experiment Station continued its efforts to improve farming practices and livestock for the farmers of the Islands. For years the policy of the station has been to provide extension and demonstration services. Experimentation has been reduced to a minimum. Limited appropriations have prevented an adequate broadening of the scope of its usefulness. It is proposed to request sufficient funds to carry out a real program of agricultural extension which includes growing and distributing various kinds of vegetable slips, importing and selling vegetable seeds, growing of field corn for seed distribution, using station equipment for land preparation for small farmers, classroom lectures and field demonstrations in agriculture, instruction by staff members in better methods of planting and cultivation processes, breeding and selling of purebred animals to improve the breeds on the Islands and free veterinary service.

For many consecutive years, municipal departmental operations in the Islands, particularly on St. Croix, have been below reasonable standards. Employees have been underpaid. Buildings have de-

THE FUTURE

Undoubtedly, the rate of revenue that Puerto Rico has received from internal revenue taxes will decline appreciably as beverage alcohol production increases in the States. Plans have been made to use the surpluses now in the Treasury for the permanent benefit of economic and social conditions on the island. Limited appropriations have prevented an adequate broadening of the scope of its usefulness. It is proposed to request sufficient funds to carry out a real program of agricultural extension which includes growing and distributing various kinds of vegetable slips, importing and selling vegetable seeds, growing of field corn for seed distribution, using station equipment for land preparation for small farmers, classroom lectures and field demonstrations in agriculture, instruction by staff members in better methods of planting and cultivation processes, breeding and selling of purebred animals to improve the breeds on the Islands and free veterinary service.

For many consecutive years, municipal departmental operations in the Islands, particularly on St. Croix, have been below reasonable standards. Employees have been underpaid. Buildings have de-

THE FUTURE

Undoubtedly, the rate of revenue that Puerto Rico has received from internal revenue taxes will decline appreciably as beverage alcohol production increases in the States. Plans have been made to use the surpluses now in the Treasury for the permanent benefit of economic and social conditions on the island. It has been impossible during the war to obtain the building materials and supplies to do the seriously needed work on schools, housing, sanitation and hospitals. Plans for all of these have been prepared and this work can start as soon as material is available.

THE VIRGIN ISLANDS

This year saw the application to the Virgin Islands, for the first time, of the Selective Training and Service Act of 1940. As this act was not heretofore applied to the Virgin Islands, registration of Virgin Islands youth for service in the armed forces of the United States was not accomplished until the President of the United States by proclamation dated October 26, 1943, directed the registration of all male citizens of the United States not previously registered. Registration of Virgin Islanders began in November 1943. The first induction call was made in June 1944. At the close of the fiscal year there were 2,185 registrants in the age group 18-44 under the jurisdiction of the St. Thomas local board and 1,475 under the jurisdiction of the St. Croix local board. In the first call for 200 inductees, 149 were supplied from St. Thomas and 62 from St. Croix, all of whom were volunteers for immediate induction.

The financial condition of both municipalities improved materially during the year, especially in the municipality of St. Thomas and St. John where income taxes yielded \$1,295,380.50 as compared with \$465,447.76 in the preceding fiscal year, an increase of 178.3 percent.

In the municipality of St. Croix income tax collections were \$114,836.45 as compared with \$46,977.22 in the preceding fiscal year, an increase of 144.45 percent. Total revenues of this municipality amounted to \$262,684.89 as compared with \$194,440.62 in the preceding year, an increase of 35 percent. This tremendous increase in revenue from income taxes is attributable primarily to the prosperity of the rum manufacturing business as well as the increased rates and lower exemptions.

The municipality of St. Thomas and St. John, with its surplus revenues, created a hospital building fund with a deposit of \$200,000; a high school building fund of \$50,000; a sewer system fund of \$150,000; a reserve fund of \$100,000; and a scholarship fund of \$10,000. Almost \$300,000 of these funds were invested in War Savings bonds. In spite of increased revenues the municipality of St. Croix still re-

quired a congressional appropriation to meet the deficit in its treasury, even though municipal services have continued at a minimum.

The withdrawal of the Work Projects Administration of the Federal Works Agency from the Virgin Islands in December 1943 left a considerable number of unfinished projects. It also eliminated relief employment for approximately 1,500 persons. Projects for nursery schools, school lunches, sewing, health, and vegetable growing projects, formerly operated by the Work Projects Administration, were taken over and operated by the Municipal Governments from December 1943 to June 1944. With the curtailment of employment on defense construction projects in St. Thomas during the closing months of the fiscal year, unemployment conditions were accentuated. In St. Croix there was considerable unemployment until the Virgin Islands Co. opened the cane harvesting season late in February which continued well into the month of May. It is estimated that there are at the present time between 1,500 and 2,000 unemployed employables in the Virgin Islands. For a small portion of these, employment will be provided on municipal projects made possible by the increase in income taxes on largely increased distilleries' profits.

Legislation was introduced in Congress for extension to the Virgin Islands of the benefits of those titles of the Social Security Act providing for old-age assistance, aid to dependent children, aid to the blind, maternal and child welfare and public-health work. As American citizens, Virgin Islanders should share equally with continental citizens in the benefits of this act. Certainly there are few spots under the American flag which so desperately need these aids. No action has been taken on this bill beyond hearings held by a subcommittee of the Senate Finance Committee.

The Agricultural Experiment Station continued its efforts to improve farming practices and livestock for the farmers of the Islands. For years the policy of the station has been to provide extension and demonstration services. Experimentation has been reduced to a minimum. Limited appropriations have prevented an adequate broadening of the scope of its usefulness. It is proposed to request sufficient funds to carry out a real program of agricultural extension which includes growing and distributing various kinds of vegetable slips, importing and selling vegetable seeds, growing of field corn for seed distribution, using station equipment for land preparation for small farmers, classroom lectures and field demonstrations in agriculture, instruction by staff members in better methods of planting and cultivation processes, breeding and selling of purebred animals to improve the breeds on the Islands and free veterinary service.

For many consecutive years, municipal departmental operations in the Islands, particularly on St. Croix, have been below reasonable standards. Employees have been underpaid. Buildings have de-

teriorated, hundreds of pensioners were receiving pitifully low monthly allowances. The lepers have had woefully inadequate provisions. Commercial and vocational education were hardly existent. Water supply is precarious and insufficient for drought periods. The increase in revenue of the municipality of St. Thomas and St. John during the past 2 years enabled correction of many of these deficiencies in that municipality. Departmental operations have been improved and expanded. Scholarships in health education, public-health nursing and agriculture have been provided. In the municipality of St. Croix an increase in revenues during the past fiscal year and an estimated increase in the coming fiscal year have been budgeted to relieve some of the worst of these deficiencies and also to liquidate the indebtedness which has been long hanging over St. Croix's headmonies which were borrowed to meet operating deficits for previous years. A deficit for the fiscal year had to be met by congressional appropriation as usual.

A Bill, H. R. 5029, was introduced into the House of Representatives to assist in providing capital funds to remedy many of these conditions in the Virgin Islands. If this bill passes the Congress it will provide total appropriations approximating ten million dollars for certain new hospital facilities, sanitation and fire protection, sewer and water systems, water supply, schools and educational facilities, highways, roads and streets, recreational facilities, telephone and radio communication, malaria control, and slaughterhouse and public market facilities. Unfortunately, its terms narrowly limit the works to be undertaken to those recommended by a survey undertaken some time ago with no provision for administrative revision in the light of needs that may exist after the war. No funds would be allowed for continuation of water-conservation work in St. Croix, a project vital to the agricultural life of the island.

THE PHILIPPINE ISLANDS

The Philippines have now been under enemy control for more than 2 years. Despite extravagant Japanese claims as to the extent to which the Filipino people are embracing the idea of the Greater East Asia Co-Prosperity Sphere, there is increasing reliable evidence that the great mass of the Filipino people are in no way deceived and remain steadfastly loyal to the cause for which they have made such heavy sacrifices. That the Japanese and the puppet government, which they have established, are having serious troubles is indicated by information obtained from many reliable sources, including the rather naive admissions of the Japanese themselves. There are evidently serious shortages of almost all essential commodities, notably food and clothing. This and the issuance of worthless currency have brought about inflation, which has made it necessary for the Japanese, after first

reducing the wage scale, to increase it far beyond anything known under the former commonwealth administration. It is inevitable under such conditions that unrest and disorder will result, and that this has occurred is evidenced by the frequent appeals of the puppet leaders and the Japanese for the people to be patient and peaceful and for repeated announcements that law and order have been reestablished. The Japanese have made a great show of attempting to convince the people of their honest intentions. The principal step in this direction was their sponsorship of a convention for the adoption of a constitution followed by the establishment of a so-called independent government.

The constitution was drawn up and approved by an organization headed by persons collaborating with the Japanese, and there was not even any pretense of participation by the people themselves.

Stripped of all excess verbiage it provided for a one-man rule upon whom the only check is by his own appointees and in whose selection the people at large have no voice. By controlling one man, the Japanese control the entire government.

José P. Laurel, who from the very beginning has been one of the leaders among those collaborating with the Japanese, was, in due course, named president of the puppet regime.

It must be recorded with regret that the individuals who have taken the leading part in this hollow mockery are for the most part men who were formerly high in the councils of the Commonwealth Government.

That their activities are a matter of serious concern to this Government is indicated by the fact that the President on June 29, in announcing his approval of a bill relating to the rehabilitation of the Philippines, said, "Those who have collaborated with the enemy must be removed from authority and influence over the political and economic life of the country."

The Commonwealth Government in Exile under the leadership of President Manuel L. Quezon¹ and Vice President Sergio Osmeña continued to function in Washington. Under the provisions of the Commonwealth Constitution, President Quezon's term of office was to expire on November 15, 1943, and the vice president would assume office. However, at the request of the Government in Exile, Congress, by a joint resolution approved by the President November 12, 1943 (now Public No. 186), provided that President Quezon should continue office until the President of the United States should "proclaim that constitutional processes and normal functions of government

¹ President Quezon died at Saranac Lake, N. Y., on August 1, 1944, and Mr. Osmeña was sworn in as president of the Commonwealth the same day, in the Office of the Secretary of the Interior.

President Osmeña landed at Tacloban, Leyte, with General McArthur, commander of the American forces, which began the reoccupation of the islands on October 20, 1944.

shall have been restored in the Philippine Islands." Thereafter, the vice president is to assume the office of the president and serve until his successor is elected and qualified.

On June 29, 1944, the President approved two joint resolutions of Congress pertaining to the Philippines. The first (now Public No. 380) declares it to be the policy of the United States Government to establish an independent government after the repulsion of the enemy and the restoration of democratic processes. The President is authorized, after negotiation with the president of the Philippines, to acquire bases in the islands for the mutual protection of the United States and the Philippines, and if he finds that orderly processes of government have been restored, to proclaim Philippine independence prior to July 4, 1946, which is the date originally contemplated by existing law in the Independence Act.

The second resolution (now Public, No. 381) provides for a joint rehabilitation commission to be composed of 18 members, 3 to be appointed by the President, 3 by the president of the Senate, 3 by the Speaker of the House, and 9 by the Philippine Government. This commission is directed to investigate and make recommendations concerning all matters affecting post-war economy, trade, finance, economic stability, and rehabilitation of the islands.

The functions of the United States High Commissioner were transferred to the Secretary of the Interior by an Executive order of the President dated September 16, 1942. In compliance with instructions of the President to the Secretary at that time, the Department has been engaged in a study of the many problems which will arise when the islands are reoccupied.

Many thousands of Americans are prisoners of the Japanese, including some 4,000 civilians, for whom the Department feels a special responsibility. In cooperation with the State Department, the Red Cross, and others interested, all possible means of assisting them all are being constantly explored. The plight of these unfortunate people, who have now been held for more than 2 years, is made much more serious by reported food shortages and inflationary prices.

Puerto Rico Reconstruction Administration

BENJAMIN W. THORON, Administrator

WHEN the President under authority of the Emergency Relief Appropriation Act of 1935 established the Puerto Rico Reconstruction Administration as an agency to administer approved projects for providing relief and work relief and for increasing employment in Puerto Rico, he stated that its main objective should be permanent reconstruction of the island's economy in terms of agricultural rehabilitation, rather than mere immediate palliative relief. Continuation of such progress as has thus far been achieved through projects with long range reconstruction possibilities, will be no less essential in the post-war period than it has been during the war, when the ever-prevailing unemployment problem was alleviated, but only temporarily, by work on Army and Navy projects.

During the fiscal year 1944, as in the 2 previous years, the Puerto Rico Reconstruction Administration has been financed with funds allotted by the President out of the Puerto Rico revolving fund, consisting only of income and the proceeds of the disposition of property derived from the Puerto Rico Reconstruction Administration's operation of projects which were financed with funds originating in the Emergency Relief Appropriation Act of 1935. The comparatively small amounts thus available have limited the Puerto Rico Reconstruction Administration's activities primarily to preservation of the most essential features of its former broad program of rural rehabilitation, and to protection of investments of the Government in housing, loans to cooperatives, etc., produced by projects of previous years. Despite these limitations the Puerto Rico Reconstruction Administration has endeavored to make its work useful to the prosecution of the war as well as of service to the island's post-war needs.

For its activities during the fiscal year 1944, the President authorized expenditures by the Puerto Rico Reconstruction Administration out of the Puerto Rico revolving fund (49 Stat. 1135) as follows:

Operation and maintenance of housing projects and facilities-----	\$250,000.00
Management of lands and leases connected with the Lafayette project-----	60,000.00
Operation of Castaner farm project-----	60,000.00
Supervision of and making and servicing of loans to cooperatives----	610,000.00
General administration-----	160,000.00
1943 unobligated balance for construction of rural houses-----	204,644.43
Operation of Central Service Farms-----	150,000.00
Subdivision and sale of lands in Lafayette district for food crop production-----	11,000.00
Total-----	1,505,644.43

A summary of the year's principal activities follows:

HOUSING MANAGEMENT

Operation of the Puerto Rico Reconstruction Administration's 1,210 urban family dwelling units and 6,254 rural houses, together with 4,891 3-acre parcels on which no houses have been built, produced rental collections in round figures of \$335,500 as against outlays for management and maintenance of \$245,000. On vacant parcels 300 additional rural dwellings were constructed of rammed earth (locally known as *tosca*), mixed with a small amount of cement. Farm laborers there resettled were assisted in raising subsistence crops to supplement their meagre earnings, so that completion of these houses added 1,500 acres of formerly unproductive land to the potential food supply of the island. As of June 30, 1944, all of the urban houses and 98.5 percent of the rural houses were occupied, and 80 percent of the parcels without houses were rented to farm laborers of the neighborhood for the nominal sum of 50 cents per month. It has been the policy to permit tenants who desire to become owners of the homes or parcels they occupy to enter into long-term purchase agreements, of which 287 in the urban zone and 3,621 in the rural districts were executed during the fiscal year.

RURAL REHABILITATION

Closely tied to the rural housing developments, which are really the backbone of the rural rehabilitation program, is what is known as the Central Service Farms Project. Federal funds of \$150,000 were supplemented by an insular legislative appropriation of \$60,000 and approximately \$110,000 made available by the Insular Emergency Council. The most important accomplishment of the project was its contribution to the food supply and income of the island by the planting of 15,000 acres in subsistence crops and 3,000 acres in cash

crops on lands of the Federal Government occupied by the Puerto Rico Reconstruction Administration resettlers. Seeds produced by 550 acres of seedbeds in the seven Central Service Farms were distributed, and fertilizers and insecticides were furnished to resettlers. Agronomists gave constant advice and supervision to cultivation, harvesting, and marketing of their subsistence crops. Resettlers were not paid for labor on their own parcels, but were paid from both Federal and insular funds for labor performed in the Central Service Farms, in the planting of fruit trees on Federal lands, in the repair and maintenance of the intrafarm roads, and the operation of some 34 rural waterworks systems, which supply potable water gratis to approximately 100,000 rural dwellers.

At the Castaner project 1,163 acres were devoted to production of coffee, sugarcane, citron, vanilla, and minor crops, furnishing employment to 200 rural families resettled on 1-acre subsistence parcels. Sale of produce from the farm proper fell \$4,780 short of the \$60,000 allotted for operation, not a bad showing considering the storm of near hurricane proportions in October 1943 which damaged much of the planting, and the 7 months' drought which greatly reduced the coffee crop. In addition to the 25-bed hospital at Castaner mentioned in last year's report as established by the National Service Board for Religious Objectors, a similar 25-bed hospital was opened during the latter part of the fiscal year 1944 at the Puerto Rico Reconstruction Administration's La Plata project, and another health unit has been started at the Zalduondo Rural Rehabilitation Unit. These institutions, authorized by the Director of Selective Service as adjuncts of Civilian Public Service camps, with technical supervision of the planning and direction of the work program by the Puerto Rico Reconstruction Administration, are providing preventive and curative health treatment to thousands of the Puerto Rico Reconstruction Administration resettlers and other rural dwellers for whom such facilities were never before available.

COOPERATIVES

As in previous years, particular attention has been given to the vegetable, cotton, and other marketing cooperatives, and to increasing the production of the butyl alcohol plant of the Lafayette Sugar Mill Cooperative. Increase to \$610,000 of the previous year's \$250,000 allotment for loans to and supervision of cooperatives, was occasioned by needs of the Lafayette Cooperative. Difficulty in meeting its obligations due mainly to former operating losses of its pioneer solvents plant, required the furnishing of an additional \$500,000 loan last December as part of a general refinancing of the mill's obligations to the Government. If for no other reason, this additional loan and re-

financing were justified by the fact that the butyl alcohol plant was able to increase production, as desired by the War Production Board, to its full capacity of more than 5 million pounds of solvents per year for the exclusive use of lend-lease and war contractors, as contrasted with 3½ million pounds exported the preceding year. Further, operations of the solvents plants have produced a substantial profit for the year, amounting to about three times Lafayette's loss from its ordinary sugar mill operations. That loss and a comparable loss sustained by the Los Canos Sugar Mill Cooperative, which is likewise financed by the Puerto Rico Reconstruction Administration, are attributed to a reduction of about 25 percent in the sugar produced in the respective areas, due partly to shortage of fertilizer, and partly to the island-wide drought. Prospects for a better crop the coming season at present are good.

A new cooperative known as the "Cooperativa de Cosecheros de Cidra" was organized and obtained a loan from Puerto Rico Reconstruction Administration of \$50,000 for the purpose of stimulating the growing, curing, and marketing of citron and kindred fruits in distressed coffee areas. These products, for which there is constant demand, have hitherto had little encouragement. Market conditions are favorable, and while operations were started late in the fiscal year, the citron curing plant is now operating at full capacity. Additional loans totalling \$22,000 were made to four vegetable marketing cooperatives; operations have so stimulated plantings by farmer members as to increase the cooperatives' 1943 business of \$100,000 to approximately \$300,000 for the fiscal year 1944. Further, the vegetable cooperatives have recently organized a central marketing agency at Rio Piedras to attract buyers in the metropolitan district, and to offset the loss of the former New York market for some of their produce, particularly tomatoes, which before the war brought a high export price. The Vanilla Cooperative has processed and will market the largest crop in its history, approximately 5,700 pounds of cured vanilla beans. The Cotton Growers Cooperative has continued to market sea island cotton (in demand for war needs) amounting to about 1,600 bales. The Sociedad Agricola, a Puerto Rico Reconstruction Administration-financed cooperative which purchases farm supplies for members and patrons, has had a particularly successful year, increasing sales of fertilizer, insecticides, feeds, etc., to over \$900,000 as contrasted with the previous year's record of around \$350,000. Close supervision is maintained of the accounting and operations of all the cooperatives to which the Puerto Rico Reconstruction Administration has made advances.

CONCLUSION

For the fiscal year 1945 beginning July 1, 1944, the President has authorized the Puerto Rico Reconstruction Administration to expend \$1,190,324 out of the Puerto Rico revolving fund for the continuation of projects similar to those herein reported. These will at least conserve some of the social and economic progress achieved, which would be completely lost if the program were entirely terminated. But very much larger sums of money, whether Federal or insular, will have to be expended for many years to come if permanent reconstruction of the island's distressed economy is to be accomplished.

War Relocation Authority

DILLON S. MYER, Director

THE fiscal year ending June 30, 1944, was an especially significant period in the history of the War Relocation Authority which became an agency of the Department of the Interior on February 16. This year brought about a full-scale development of the Authority's program to provide for the relocation, maintenance, and supervision of 110,000 persons of Japanese ancestry who were evacuated by military order from the West Coast in the spring of 1942.

The general objectives of the program had been defined in broad outline shortly after the agency was created by a Presidential order on March 18, 1942, but much had to be done before the program could be put into full operation. Of foremost importance was the need to acquire knowledge of the essential character and composition of the evacuee population in order to devise the most practicable procedures and techniques for resettling in normal communities those people who presented no danger to the national security. Methods of separating the loyal and law-abiding element from the trouble makers and others whose stronger ties were with Japan had to be developed. Ways to relocate those who were law-abiding and loyal had to be planned and organized. At the same time, the establishment of the relocation centers and the organization of personnel and services to provide adequate care and supervision for the people temporarily quartered in them also called heavily on the time and resources of the War Relocation Authority in the first year of its existence.

Three basic considerations have been taken into account in formulating the Authority's program for the past 12 months. First, the War Relocation Authority has been fully cognizant at all times of the necessity for observing adequate precautions for the national security. Secondly, it has recognized an obligation to preserve the basic American principles of humanity and justice by protecting the constitutional rights of the American citizens involved in the evacuation, and by dealing fairly with the aliens. Thirdly, it has held con-

sistently to the belief that the best interests of both the evacuees and the Nation call for the liquidation of the relocation centers as rapidly as possible by returning the eligible residents to the mainstream of American life.

The ultimate goal of the War Relocation Authority is to complete the job of relocation of all evacuees in normal communities outside of relocation centers. The sooner it can complete its program, the more successful its service to the Nation will have been.

THE RELOCATION PROGRAM

Several factors had combined to delay the progress of relocation outside the centers before the summer of 1943. At the start, it was necessary to develop procedures for determining which members of the evacuee population should be permitted to depart from the centers on indefinite leave, and which ones should be detained. Time was needed to perfect these procedures, and to conduct individual hearings for thousands of evacuees whose eligibility or ineligibility for leave clearance could not be otherwise established.

There was, furthermore, the need to develop practicable plans for getting older people and families out of the centers. In the year preceding July 1, 1943, between nine and ten thousand people had relocated, but the great majority of them were young Nisei without family responsibilities. The population of the centers was getting harder to move as the percentage of younger people decreased.

Various other deterrents were also in evidence. Among them were the uncertainty of the evacuees regarding public sentiment, the difficulty of obtaining clearance for them to work in war plants, and housing shortages.

It was early recognized that the success of the relocation program would be determined, in a large measure, by the degree to which the evacuees approved its purposes. As early as July 1943, relocation committees to plan and encourage relocation had been organized among the residents of several centers, and increasing emphasis was placed on strengthening these committees and organizing new ones in the months that followed. By the end of the year, every center had a relocation planning committee, composed either entirely of evacuees or jointly of evacuees and staff members. Issei were well represented on these committees and were especially helpful in bringing evacuee questions and suggestions to the attention of the administrative staff.

The earlier relocation of younger Nisei had been mainly to the cities, but evidence was mounting in the centers that more emphasis was needed on rural relocation. Approximately 43 percent of the evacuees had come from farming communities, and most of those with agricultural backgrounds wanted to return to the land. They wanted opportunities which would enable small groups of families to relocate

together, where they could have the association of neighbors of Japanese descent, and they stressed the necessity of sending responsible evacuee representatives into the field to investigate the opportunities before decisions could be made.

Many families had suffered heavy losses in the evacuation. If they were to leave the centers to start new farming ventures, they needed financial assistance.

In November, the national office undertook a program to make available to these farm families the assistance that they seemed to require. The relocation officers in the field were directed to give specific attention to the development of opportunities for families to resettle in small groups, and exploratory trips by responsible evacuee representatives were authorized. On the financial side, the stimulation of credit unions among the residents of the centers was suggested as one means of providing funds for families that needed financial aid, and detailed information was provided on the availability of loans from Federal and private agencies.

Other developments of the relocation program were made, following studies and surveys of the problems presented. During the early part of 1943, each individual who left a relocation center on indefinite leave was given a leave assistance grant of \$50, with \$100 as the total amount that could be granted to any one family. To encourage the resettlement of larger families, the grant was reduced in October to \$25 per individual and the \$100 limit was removed. An agreement was made with the Federal Security Agency which made relocated evacuees eligible to receive assistance under the program for aliens and other persons affected by restrictive governmental action during the war. The cooperation of the Federal Housing Administration was obtained to help the War Relocation Authority staff in determining the acceptability of the evacuees for housing in various localities, and to suggest localities where housing opportunities for evacuees appeared more promising.

At the relocation centers, welfare counselors were assigned to interview families with a view to breaking down the rationalizations of reluctant families and to gathering information which would help the War Relocation Authority to plan its future course of action more realistically. Relocation officers and other staff members who were familiar with conditions in various sections of the country visited the centers both singly and in teams to bring first-hand information to the residents and to answer questions for them. Meetings and forums were held, informational publications were distributed, and motion pictures borrowed from public and private agencies were shown, depicting various cities and rural areas.

The need to get information into the centers, regarding the communities and areas where the people were encouraged to relocate

emphasized repeatedly. Few of the evacuees had ever been east of the Sierra Nevadas before they were evacuated. The Middle West and East were regions almost unknown to them.

To facilitate the gathering of information, reports officers were assigned to the principal relocation offices in Denver, Kansas City, Chicago, Cleveland, and New York City. The Washington reports office also set to work on the preparation of descriptive and illustrated pamphlets designed to reveal the character of the relocation areas to the evacuees. Personal stories of individuals and families who had relocated successfully were found to be especially effective in the centers.

Prior to the fall of 1943, all phases of the relocation program, both at the centers and in the Washington office, were functions of an Employment Division which was also responsible for the employment of evacuees to maintain center operations. In November, however, a new Relocation Division was organized to give exclusive attention to the relocation program, while other functions of the Employment Division, which was then discontinued, were transferred to the Administrative Management Division.

Six relocation areas had already been established with headquarters in Salt Lake City, Denver, Kansas City, Chicago, Cleveland, and New York City. These offices now came directly under the supervision of the Relocation Division in Washington, and they, in turn, were responsible for supervising all branch offices set up in the regions that they represented.

It had been the policy of the War Relocation Authority from the beginning to discourage the concentration of the evacuees in large numbers in any one community; nevertheless, the people from the centers showed a strong disposition to congregate in certain localities. The most popular localities for resettlement were in the Rocky Mountain States, especially in Colorado and Utah, and in the Chicago metropolitan district. The concentrations aroused local opposition particularly in the Inter-Mountain region.

The Relocation Division moved to meet the problem, under the authority of the Director, by restricting permission to relocate in the Inter-Mountain and Western Plains States to the members of families already relocated in those areas, and by stressing the relocation program in the Middle West and East. The New England States were set apart in a new relocation area with Boston as its headquarters. In May and June, a start was made toward developing resettlement in certain parts of the South, by opening relocation offices in New Orleans and Savannah.

At the start of the relocation program, emphasis had been placed on securing job offers for the evacuees while they were still residing in the centers. Many offers were obtained, but for several reasons the

evacuees were reluctant to accept them. One reason was that many of the jobs were not the kind which they wanted or which they were trained and experienced to fill. Since the demand for domestics was especially keen, the supply of domestic workers at the centers rapidly approached the point of exhaustion. Another reason was reluctance to accept employment without meeting the prospective employers in advance and learning, from first-hand observation, the character and conditions of the job that had been offered. Too often, even when evacuees accepted offers, they stayed on the jobs only a short time before switching to other employment. It became obvious that a new approach was needed to the relocation problem.

To meet the situation, the relocation officers in the field were instructed to cease sending to the centers long lists of job offers, which were often more confusing than helpful, and to prepare, instead, brief summaries on employment conditions in the areas where they were assigned to duty, emphasizing information about the abundance or scarcity of certain kinds of opportunities, the attitude of the community, and the housing situations. They were directed to give more attention to the development of community acceptance and cooperation, and to seek community invitations for groups of evacuees to come from the centers to look over local conditions before accepting employment.

It was the plan to shift as much responsibility as possible to voluntary cooperating committees. The churches and welfare agencies have been especially helpful in organizing these committees which were functioning, by the end of the fiscal year, not only in every middle-western and eastern community where a relocation officer was stationed, but in a number of other communities as well.

The functions of the cooperating committees were to foster favorable community sentiment, and to assist evacuees in adjusting themselves to normal community life. Insofar as possible, they were to help arrivals from the centers to find acceptable employment and housing, and to develop social and recreational opportunities for them. Especially, they were asked to cooperate in the development of plans to accelerate the relocation of families and older people.

Two devices were used to provide temporary residence for evacuees while they were looking for employment. In several cities, special hostels were opened by cooperating groups; in other places arrangements were made with YMCA's, YWCA's, settlement houses, and churches, to make quarters available for them.

There had not been sufficient time, by the end of the fiscal year, to make a fully adequate test of the effectiveness of the new relocation policies in stimulating the resettlement of families and older people. Of the 16,846 individuals who departed from the centers on indefinite leave during the 12 months, by far the greater number were young

Nisei without family responsibilities, but an encouraging increase was noted in the number of total family groups that relocated toward the end of the period. More notable was the increase of relocation farther east. While the Great Lakes States—Wisconsin, Illinois, Indiana, Michigan, and Ohio—received the largest number, the percentage increases in the Middle Atlantic and New England States were much higher. The trend was definitely eastward.

The acceptance of the evacuees in the communities where they relocated was generally good. There were a few incidents, however, that emphasized the need for the cooperating committees, and for the development of favorable community sentiment before the evacuees arrived. In New York City, resistance developed to the establishment of a hostel in Brooklyn, but was overcome by the efforts and influence of individuals and organizations cooperating in the War Relocation Authority program. Other incidents involving small groups of evacuees occurred in New Jersey, Delaware, and North Carolina, and in two midwestern communities, one in Iowa and one in Nebraska. The general reaction of the country at large was distinctly critical of these communities and favorable toward the evacuees.

The progress of relocation to the end of the fiscal year permitted one center—the Jerome Relocation Center in Arkansas—to be closed on June 30. Four other centers, where space was available, were designated to receive the Jerome residents. A transfer of 2,489 Jerome residents was made by truck to Rohwer, 35 miles north; 2,049 were sent to Gila River in Arizona; 549 to Granada in Colorado, and 499 to Heart Mountain in Wyoming. Before the transfers started, efforts were made to induce as many people as possible to relocate. Those who chose to relocate numbered 518.

SEASONAL WORK LEAVE

An early development in the leave program of the War Relocation Authority was an arrangement whereby groups of evacuees were permitted to leave the centers to assist in harvesting crops in the regions where the centers are located. Under the provisions of the leave granted to them, they were required to stay in specific areas unless authorized to move elsewhere by the relocation officers. At the termination of the work, they were returned to the centers unless, in the meantime, they had obtained indefinite leave.

These workers, who were employed chiefly in the sugar beet harvest, were credited with saving thousands of acres of beets in 1942 and 1943. Others helped to harvest potatoes, long staple cotton, and other crops.

During the year a considerable number of seasonal leaves were converted into indefinite leaves to enable the workers to accept offers of permanent jobs in the communities where they had been temporarily

employed. When certain areas of the West were restricted for relocation purposes to avoid concentrations, however, the usefulness of seasonal leave as a stepping stone to relocation was considerably diminished. Moreover, as time progressed, a good many evacuees—especially young men—began to show a disposition to favor seasonal leave as more desirable than indefinite leave. Each season, after several weeks of outside employment at good wages, they could return to the centers with enough pocket money to satisfy their incidental needs until another harvest season arrived, and they were increasingly reluctant to apply for indefinite leave under terms that made return to the centers and the resumption of living at Government expense more difficult.

The competition among agricultural employers for workers from the centers also presented a troublesome problem. Even at the outset, the supply of available workers was never sufficient to meet the total demand, and, as the employable population of the centers dwindled, through relocation, the inadequacy of the supply became more acute.

In February 1944, the seasonal work leave program was modified to provide for the issuance of seasonal leave only to persons recruited for agricultural work through the War Food Administration, and employment was authorized only in counties approved by War Relocation Authority relocation officers. This modification of the program improved controls and the systematic granting of leaves to meet critical manpower shortages. It was still impossible, however, to supply enough workers to satisfy all of the calls that were made for them.

There were 7,603 seasonal work leaves granted during the last half of 1943, and 5,029 during the first half of 1944, making a total of 12,632 for the 12-month fiscal period.

THE SEGREGATION PROGRAM

It was recognized from the time when the War Relocation Authority was first organized that some of the evacuees preferred to think of themselves as Japanese rather than Americans. Among them were people who wanted to return to Japan, and possibly some who could not safely be granted the privilege of moving about the country at will in wartime. These people had to be set apart from the others who desired to remain law-abiding residents of the United States.

Three categories were established for segregation which was, by every measure, the major War Relocation Authority undertaking in the fall of 1943. First, all persons who had filed applications for repatriation or expatriation to Japan, and who had not retracted their requests before July 1, 1943, were scheduled for immediate segregation at the Tule Lake Center in northern California. Also included in the first segregation were those who, in a registration conducted at

all of the centers in the spring of 1943, had answered in the negative a question pertaining to their loyalty to the United States, or who had failed or refused to answer it, and who had not changed their answers to the affirmative before July 15, 1943, or who, having shown a disposition to change their answers, had failed to satisfy the project director involved in each case that the changes were made in good faith. In the third category were all persons to whom the Director had denied leave clearance after individual hearings. Designated to receive these individual hearings were all persons who (a) were subjects of adverse reports by Federal intelligence agencies, (b) had changed their answers to the loyalty question from a negative or a qualified affirmative to an unqualified affirmative, (c) had retracted their applications for repatriation or expatriation to Japan, (d) had not been recommended for leave clearance by the Japanese-American Joint Board established in the office of the Provost Marshal General, or (e) for any other reasons were believed to be loyal to Japan. Also involved in the segregation was a fourth group of considerable magnitude composed of the families and dependent relatives of the actual segregants.

The major movement of the first two groups of segregants was accomplished between the middle of September and the middle of October, when 8,573 persons were transferred to Tule Lake. In the same period, 6,250 persons, already residents at Tule Lake, who were not subject to segregation, were moved to other centers to make room for the arrivals. Another movement of 1,876 persons, whose transfer to the segregation center had been postponed to permit the construction of barracks to house them, was made in February, and a third transfer of 1,665 persons was conducted in May. These movements were all accomplished without disorders or serious mishaps of any kind.

Persons in the third category of segregants, designated to receive individual hearings, have been sent to Tule Lake from time to time, and others will be sent as they fail to convince the Director, or his authorized representatives, that they should be granted leave clearance. Decisions were made on 8,834 cases which were reviewed during the fiscal year; 7,307 were approved for leave clearance, and 1,527 were disapproved.

Evacuees who have been denied leave clearance may appeal to a board which has been chosen with special care outside the War Relocation Authority organization to give the appellants impartial hearings. This appeal board, however, serves only in an advisory capacity; the authority to grant or deny leave clearance rests in the final analysis solely with the Director of the War Relocation Authority. Twenty-four appeals were made prior to June 30, 1944, and were scheduled to be heard by the Appeal Board in July.

There were 8,981 requests for repatriation and expatriation during the year, which raised the total number of effective requests to 15,366. The cancellations numbered 1,060. Three hundred and thirteen persons were sent to Japan under an exchange of nationals arranged by the State Department.

A marked increase in the number of requests for repatriation and expatriation has followed every major change in government policy affecting the evacuees. About 10,000 of the requests on file were made during or immediately following crises brought about by the Army and leave clearance registration which was conducted in the spring of 1943, the segregation activities of the summer and fall, and the Army announcement on January 20, 1944, that Nisei were to be inducted under Selective Service procedures.

A large percentage of the requests appear to be based more on emotion than reason. The evacuation, the loss of economic security that went with it, and evidences of antagonism outside the centers have filled the evacuees with fear for the future, and any change of policy adds to their alarm. Few of them are motivated to request repatriation or expatriation because they have any real interest in Japan or expectation of going there. They are tired of moving and Tule Lake seems to them the one place where they may be allowed to stay for the duration of the war. They seek segregation to escape pressure to relocate under wartime conditions, to hold their families together, or to protest against the evacuation. Others who do look to a future in Japan have built up fantasies of life there with hardly any actual knowledge of the country they are choosing.

The population of Tule Lake at the end of the fiscal year was 18,672. Of this number, about 3,300 were minors under 17 years of age, and approximately 1,800 others were living at Tule Lake Center merely to be with members of their immediate families who had been segregated.

A relatively small element of troublemakers in the center has caused several disturbances which the major part of the population has had no voluntary or intentional part in abetting. The first occurred immediately after the first segregation movement when a group of ruffians attempted to gain control of the community. On November 1, during a visit of Director Myer to the center, agents of the troublemakers announced in the mess halls that the National Director would make a speech at the main administration building shortly after noon. As a result, between 3,500 and 4,000 men, women, and children gathered in the administration area. While they waited for the Director to appear, 17 men entered the building and presented a series of demands. Mr. Myer told them, and later repeated to the crowd outside, that the War Relocation Authority would consider requests from the evacuee population, provided they

were in the framework of national policy, but that it would not accede to demands. After he spoke, the crowd dispersed.

In the meantime, however, about a dozen rowdies, evidently members of a gang, had entered the center hospital and administered a beating to Dr. Reece M. Pedicord, the Chief Medical Officer. There was no evidence that the crowd as a whole was aware of the plot or consciously a part of it.

This demonstration was grossly exaggerated by certain West Coast newspapers. Charges that the crowd was angry and violent in spirit, that many members of it carried knives and clubs, and that others carried straw soaked in oil to fire the buildings were not substantiated by later testimony. Of the 31 witnesses, members of the War Relocation Authority's staff at Tule Lake, who commented on the attitude of the assembly, some described it as quiet but expectant, others spoke of it as quiet and friendly, and several remarked on the holiday spirit that seemed to prevail especially among the children.

Several days later, on the evening of November 4, a group of about 400 young men, many armed with clubs, entered the administration area where some of them congregated in the vicinity of the warehouses and the motor pool. Others surrounded the residence of the project director who telephoned to the commanding officer of the military guard outside the gates and asked him to take full control of the center. Troops entered at once and restored order, in accordance with a memorandum of understanding between the War Relocation Authority and the War Department, which had been in effect since the inception of the War Relocation Authority program. This agreement stipulated that the Army would provide special assistance to the War Relocation Authority in such emergencies.

The Tule Lake center remained under control of the Army until January 14, when the War Relocation Authority again took over internal administration. During the period of Army control, the War Relocation Authority personnel continued to function under the orders of the commanding officer.

About 375 persons who had been implicated in the November disturbance or whose influence was believed to be detrimental to the law and order of the center, were subsequently confined in a "stockade" under Army orders, and most of them were still confined when the War Relocation Authority resumed control of the center. The original group included approximately 100 aliens and 275 citizens. An arrangement was made with the Department of Justice to transfer from the "stockade" to Justice Department internment camps those aliens who were considered dangerous to the national security.

Later disturbances at Tule Lake were of a minor character and generally consisted of attempts by the strongly pro-Japanese element to intimidate other residents. These infringements on the peace

of the community have not been easy to curb, owing to the frequent difficulty of identifying the aggressors. They serve, however, to spotlight the fact that the population of Tule Lake—contrary to popular impression—is not exactly a homogeneous group entirely motivated by a feeling of allegiance to Japan.

NATIONAL SELECTIVE SERVICE

On January 21, the Army announced that Selective Service inductions of Nisei, which had been suspended in the spring of 1942, were to be resumed. The result was the calling of 3,377 men before July 1. Of this number, 1,430 were accepted, 460 were inducted into the Enlisted Reserve Corps, and 194 entered active duty. One hundred and eighty-eight refused induction when called, and 106 of them were arrested by officials of the Department of Justice. No action had been taken before the end of the fiscal year with regard to the others who continued to refuse induction.

The principal resistance developed at the Heart Mountain Relocation Center where 76 young men refused to be inducted owing largely to the influence of a group in the community which called itself the "Fair Play Committee." The head of this committee argued that it was unjust to draft Nisei until all discrimination against Japanese-Americans was eliminated, and the Nisei were admitted to all branches of the Army and Navy on an equal footing with other Americans. These arguments were cautiously phrased, however, in an effort to avoid statements that might incriminate the committee members. The committee chairman was a citizen of the United States, born in Hawaii, had never been to Japan, and had no record of disloyalty or disobedience to law prior to the evacuation. On April 1, he was segregated in Tule Lake, together with several of his principal supporters, where he was later taken into custody by the Federal Bureau of Investigation on charges of violating the Federal sedition and conspiracy laws.

The 188 young men who refused induction slightly exceeded one-half of 1 percent of the total number called by the Army. The great majority answered the call willingly, and the departure of most of the boys who have been summoned to active duty has been marked by patriotic demonstrations in the centers.

CONDITIONS IN THE RELOCATION CENTERS

The adoption of evacuee government charters at four relocation centers during the latter half of 1943 brought to eight the number of centers which have instituted formal plans of representative community government. At Manzanar, which remained the only relocation center on June 30, 1944, without a community council elected by the people, the project director continued to retain direct authority

over all community affairs, but with the counsel and assistance of a block managers' assembly. Under the War Relocation Authority regulations, Local government was not provided at the Tule Lake Segregation Center.

The community councils, together with other evacuee commissions and committees related to the community governments, have rendered much valuable service to the War Relocation Authority program. At several centers, they provided outstanding assistance in the reception of evacuees transferred from Tule Lake when it was converted into a segregation center, and from Jerome when that center was closed. They helped to stimulate relocation by conducting surveys, transmitting information, and facilitating the work of the relocation teams that visited the centers. When the reinstitution of Selective Service for Nisei was announced, they contributed to bringing about a better understanding of the War Department action by the people in the centers. They sponsored visits by Nisei war heroes, and supported the internal stability of the centers by negotiating for the evacuees in labor disputes, improving labor relations, and helping to meet critical manpower shortages.

Many problems of center operation have grown in acuteness as relocation and Army inductions have drawn away the younger residents and professional people. However, all divisions and sections of the War Relocation Authority cooperated in the major program of the agency to relocate people outside the centers as rapidly as possible without allowing any service essential to the life of the communities to lapse.

Among the activities affected by serious manpower shortages was the agricultural program which is designed to produce as much as possible of the food required by the residents of the centers. In spite of the loss of agricultural workers, however, only one center—the Granada Relocation Center in Colorado—was forced to curtail production. More than 7,500 acres of vegetables were planted and harvested at all of the centers. The meat production totaled 2,373,829 pounds of pork and 1,283,824 pounds of beef. An estimate of the value of all the food produced was placed at \$3,089,606.

Many competent workers in the business enterprises—accountants, storekeepers, beauty operators, shoe repairmen, laundry workers, dry cleaners and others—were also lost when they departed to accept employment in outside communities where they could make more profitable use of the skills and experience that they acquired in the centers. These business enterprises are maintained by the evacuees on a cooperative basis to provide the residents with essential goods and services not included in the basic needs supplied by the Federal Government.

Insofar as possible, all employment in the centers is designed to provide the workers with training and experience which will help

them to enter gainful occupations when they relocate. Agricultural and community enterprises have been especially helpful stepping stones to employment outside the centers. Other skills that find a ready market are developed by several community industries—particularly the garment and mattress factory at Manzanar and the silk screen poster shop at Granada. In the 12 months before July 1, 1944, 25,630 garments and 4,020 mattresses were manufactured in the former center, and 47,701 posters were produced at Granada chiefly to fill orders for the Navy. Also produced for the Navy were 67 ship models, including two large-scale models turned out by the evacuee shop at the Gila-River Center. Furniture and food products were made at all of the centers.

Two major aims were stressed by the education program in the centers: (1) to provide standard elementary and secondary schooling for the evacuee children, and (2) to make available to the adults courses to prepare them for successful relocation. The inability of many of the older Issei to speak English has been one of the most serious handicaps retarding their relocation. To overcome this obstacle, special English courses were offered and practice exercises in speaking English were introduced into adult education classes at the relocation centers. Special courses in American customs, home-making, and various vocations were offered to develop interest in relocation, to prepare the older people to participate in community life outside the centers, and to equip them to earn their livelihoods. There were 10,175 people enrolled in adult education classes in May 1944; 2,779 in English courses, 1,186 in vocational courses, and 6,210 in other courses related to the orientation program.

The elementary and secondary schools also participated in developing interest in relocation through special projects in civics, history, and kindred subjects. The total regular school enrollment in May was 20,907.

Health conditions at the centers were generally good. There were no major epidemics; the deaths numbered 623, and the births 2,125. In the health and medical program, however, as in other essential programs in the centers, adjustments were necessary to maintain adequate services in the face of personnel losses. Only 30 evacuee physicians, most of them elderly men and some on duty only part time, remained in the centers at the end of the fiscal year. Relocation and Army inductions took 22 others who had been employed at the beginning of the period. This loss necessitated the appointment of 8 additional nonevacuee physicians, increasing the appointed staff to 20. The shortage of evacuee nurses was even more acute. Only 7 remained on June 30, 1944, and the recruitment of nonevacuee nurses to fill vacancies proved exceedingly difficult.

Average bed occupancy in the hospitals increased approximately 20 percent, owing in part to a gradual accumulation of tuberculosis patients, and in part to the need of providing care for elderly persons left behind by younger family members who relocated. Custodial barracks under minimum medical supervision were opened in several centers to provide care for them.

General maintenance costs were sharply increased at all the centers, owing to the deterioration of temporary construction. The quantities of materials needed to repair barrack roofs and to replace the tar paper used to cover the outside walls increased greatly. Many interiors required additional material to maintain them in livable condition. Lack of foundations caused many structures to settle; inferior lumber warped and cracked. Overcrowding in small apartments also brought about considerable damage.

Other maintenance troubles centered in the water systems which were often constructed of second-hand material. Old water mains sprang leaks; pipes and fixtures had to be replaced.

The problem of keeping motor transport equipment in operation was especially critical. Evacuees skilled in automotive repair work were among the first to relocate, and replacements from the center population were almost impossible to find. Additional difficulties arose from the scarcity of material and parts to make repairs of any kind.

The highly inflammable character of the construction at all the centers, and the dryness of the climate in which most of them are located, make for heavy fire hazards. On Christmas Day, a fire at the Colorado River Relocation Center resulted in the destruction of property valued, according to estimates, at about \$42,000. The major loss was suffered by the evacuees whose furniture and personal belongings were stored in the buildings consumed. On March 5, a \$16,000 fire occurred at Gila River. On both occasions, water shortages seriously hampered the fire fighters. Two other fires that caused damage in excess of \$5,000 in each instance occurred at Colorado River and Tule Lake.

All problems of center operation are bound to become more acute as the progress of relocation takes from them the younger, abler members of the communities, and as the physical equipment deteriorates with age and use. These problems have been frankly viewed by the War Relocation Authority which will continue to meet them with the best resources at its command.

LITIGATION

Two court cases of interest to the War Relocation Authority arrived at new developments during the 12-month period. In December, the Ninth Circuit Court of Appeals sustained the conviction of Fred T.

Korematsu for violating Civilian Exclusion Order No. 34 issued by the commanding general of the Western Defense Command. This decision held valid the evacuation and exclusion program. At the end of the fiscal year, the case was pending before the Supreme Court of the United States which had granted a writ of certiorari to review the lower court's decision.

The second case had to do with a petition for writ of habeas corpus filed by Miss Mitsuye Endo who originally sought to obtain release from the Tule Lake Center. When Tule Lake was converted into a segregation center, she was transferred to the Central Utah Relocation Center. This case was complicated by the fact that Miss Endo had been granted leave clearance. She was free to leave the center at any time by complying with the general provisions of the leave clearance regulations which require all evacuees who relocate to offer evidence that they can support themselves outside the centers, and to agree to report changes of address. These provisions she refused to accept.

When a Federal District Court in California denied the writ, Miss Endo appealed to the Ninth Circuit Court which considered the case but did not decide it. Instead, the Circuit Court certified to the United States Supreme Court four questions bearing on the validity of the War Relocation Authority leave regulations. This case was on the calendar of the Supreme Court at the end of the fiscal year.

EMERGENCY REFUGEE PROGRAM

On June 9, a new responsibility was given to the War Relocation Authority when President Roosevelt announced that the agency would be placed in charge of an emergency shelter at Fort Ontario, N. Y., for approximately 1,000 European war refugees. Plans to receive the refugees were under way at the end of the fiscal year. A director for the shelter had been named, and steps had been taken to organize the personnel necessary for its operation.

CONCLUSION

The objective of the War Relocation Authority, with regard both to the evacuees and the refugees who have been, or may be, placed under its supervision, is to hasten in every available way, through the direct use of its own resources and in cooperation with other agencies, the termination of the conditions that require the maintenance of Government projects to care for these people. The War Relocation Authority program is an emergency program which should be completed and liquidated as rapidly as possible. It should not be continued into the post-war era.

Board on Geographical Names

MEREDITH F. BURRILL, Director

GEOGRAPHICAL names, recognized to be important tools of war, may be equally important instruments of peace. Attu, El Alamein, Guadalcanal, Salerno, and Tarawa, little known in this country 2 years ago, have become bywords. Tomorrow the peoples of the world will be tied together by even faster communication and an even greater number of common objectives. In post-war international trade and travel, consistency in geographical nomenclature will be as necessary as in time of war, and the names of far-distant cities will be as familiar as our own.

The Board on Geographical Names, in seeking and finding answers to the multiple problems of place names all over the world, is contributing to the peace as well as to the winning of the war. Although this emergency often has made necessary the adoption of principles emphasizing speed and quantity more than precision in the treatment of names, the overwhelming share of the Board's work will stand the test of peacetime requirements. With but few exceptions, the problems of geographical names, once they are solved, need never again hamper either the defense or the commerce of this Nation. Reorganized shortly before the beginning of the fiscal year, the Board has made rapid strides toward securing uniformity of name usage by Federal agencies, its basic function which it could not perform properly before for lack of staff and source materials. In the more than 50 years since the establishment of the original Board, a total of about 25,000 name decisions had been rendered, about one-fifth of which were foreign names. The simple rules covering foreign names laid down years ago have proved to be basically sound but inadequate for large-scale mapping. Proper application of these very general rules to the complex problems of geographical names in diverse countries without

further assistance from the Board would have required each agency using such names to make exhaustive studies. They were not prepared to do this, and consequently there was wide variance in names on the Federal maps and charts of foreign areas.

Much of the early part of the present year was spent in recruiting and training an adequate staff, developing techniques and procedures, and collecting and evaluating source materials. The Board now has a highly competent professional staff including geographers, linguists, and other experts brought together in the face of insistent doubts that such a technical group could be assembled at a period when competition for such services was necessarily great. The Board has collected and cataloged a library of over 100,000 maps and 12,000 textual sources which make this source-materials library the finest in the Western Hemisphere dealing exclusively with the problems of geographical names. Most of these sources have been contributed by persons and offices vitally interested in place-name problems.

During the fiscal year the Board has increased the output of decisions one-hundred-and-forty-fold over the yearly average of the last decade and has provided detailed directions for treating names in a large number of foreign areas, emphasizing those of greatest military importance. These directions have made possible a consistency of usage among map makers not otherwise obtainable and have enabled military map makers to compile maps not simply with names but with the best names that can be had in the absence of decisions. The Board has compiled finding lists for the rapid identification of more than 500,000 places and features on military maps. Hundreds of thousands of individual place names have been checked and corrected, in advance of publication, on maps and strategic intelligence and planning materials where consistency and good name-usage have contributed to the usability of military information.

The Board has established and maintained an information service that has assisted in the answering of individual place-name inquiries from more than 50 Federal war agencies and offices. By doing this kind of work for all, the Board has not only provided the best of such information and reduced confusion and delay but also has done so at a fraction of the cost in time, money, and manpower which would have been required if individual agencies had been forced to do this work for themselves.

The fund of experience necessary in carrying on this place-name work which has been accumulated is highly important for the future. Aside from the work of private individuals on a small number of specific problems and the relatively small amount of this kind of research previously carried on by the Board, there was extant in this country relatively little published work or experience dealing with place names as an integral part of map production and much of this

was not available to all compilers of maps and intelligence. The basic research which has been and is being carried on by the Board is making generally available adequate sources for names of literally millions of places and features.

The Board is in a position to render real and significant service to the Government and thus to individuals. Furthermore, it is much cheaper for one Government agency to maintain a central collection of place-name information than for each agency to maintain its own, and the same names—the right names—will be used on all Federal maps and publications in wartime and in peacetime only if all Federal agencies use the same source. This source can continue to be provided, as it is being provided, by the Board on Geographical Names.

Office of the Solicitor

FOWLER HARPER, Solicitor¹

THE Solicitor's office has concentrated during this fiscal year on aiding the Department to carry on its threefold work of supporting a war, preparing post-war action, and protecting the Nation's resources for their best long-term use. Achievements have been significant despite the complications of a wartime economy, of the new laws called forth by that economy, and of the constant need to reckon with post-war changes.

Wartime controls.—Certain activities are exclusively “for the duration.” Among these is civilian explosives control by the Bureau of Mines under the act of December 26, 1941. Greatly needed as part of this control were explicit regulations on the storage, handling, and transporting of explosives. These were drafted by the Mines Division of this office. The burden of the division's work, however, lay in the enforcement of the act and regulations, and a number of license revocations and convictions resulted. Troublesome questions of conflicts of powers and duties between State and Federal officers were solved and model State explosives laws were prepared for submission to the States holding regular legislative sessions.

Among the most urgent and novel war problems were those incident to the possession of the coal mines under the Executive orders of May 1 and November 1, 1943. Within the framework of principles and procedures mapped out for the handling of this emergency by the Solicitor's office, the Legal Division of the newly created Coal Mines Administration worked out the necessary orders, instructions, and instruments of operation and assisted in the conduct of litigation, as well as in negotiations leading to the termination of outstanding disputes and the return of the mines to private operation.

The Legal Division of the Solid Fuels Administration for War also operated as an integrated part of that administration. In perform-

¹Warner W. Gardner served as Solicitor until his military furlough on August 31, 1943. J. S. Cohen served as Acting Solicitor until Mr. Harper's appointment on September 7, 1943.

ing its main job of devising legal mechanisms for obtaining a fair and equitable distribution of the limited supplies of coal and other solid fuels, the division drafted the regulations and orders, organized industry advisory groups, and passed upon almost all proposed actions of the agency.

With the transfer to the Department of the War Relocation Authority on February 16, 1944, the Solicitor's office inherited a series of pending cases and problems raised by the enforced detention of over 100,000 persons, two-thirds of whom are citizens. Important aspects of the constitutional questions are now before the Supreme Court. At the same time this office found itself faced with the many-sided legal tasks of that authority in furnishing advice not only to the administrators, particularly with respect to hearing procedures used in segregating the disloyal, but also to the community organizations of the relocation centers, and to individual evacuees, particularly with respect to their abandoned property.

Public lands and resources.—Nowhere is the double objective of full wartime use and long-term conservation of the Nation's resources more in evidence in the legal work of the Department than in that performed for the agencies engaged in the administration of the public lands. In carrying out the war programs of the General Land Office, Geological Survey, and the National Park Service, the legal divisions of those agencies and the Public Lands Division of this office have aided in the withdrawals of public land, now amounting to over 16 million acres, for war purposes, and the utilization of the public land by lease and permit for the extraction of critical minerals, oil and gas, timber, and other products and for the location of military facilities. Similarly, the Conservation Division of this office and the Legal Division of the Grazing Service have passed upon the utilization of grazing land for military purposes and greater food production. Over 1,600 war emergency licenses for additional grazing have been issued following the determination by the Conservation Division of the authority therefor.

In line with the great increase of unit plans in oil and gas production since Pearl Harbor, the Public Lands Division and the Legal Division of the Geological Survey gave frequent consideration to unit and cooperative agreements, particularly for the development of wildcat areas to discover new reserves, for cooperative drilling arrangements to conserve materials, and for protection against drainage of deposits. Oil and gas rights were the subject of most of the important court cases handled by the Public Lands Division either directly or by furnishing assistance to the Department of Justice. Of the cases thus far decided, the United States has been successful in all except the litigation over oil rights in Los Cerritos Channel, Calif. The Public Lands Division also took part in the Department's con-

sideration of a domestic military oil reserve program. In anticipation of post-war large scale coal mining operations in Alaska, the coal mining regulations of the Geological Survey were amended to apply to that territory.

The Public Lands Division notably protected the permanent interests of the Nation when it discovered that certain ancient "forest lieu selection rights" offered for the purpose of acquiring surface title to potash lands for lessee potash companies and valuable timber lands were invalid. The Property Acquisition Division of this office assisted in the acquisition of extensive new acreage in its approval of title to over 25,000 acres acquired under the Taylor Grazing Act in exchanges which have aided consolidation of grazing lands, of over 263,000 acres acquired under the Forest Exchange Act, and of over 800,000 acres acquired for national parks. The exchanges of land for timber under the Forest Exchange Act, reviewed by that division, have facilitated the movement of timber for war purposes. The passage of Public Law 273, largely drafted by the Legislative Division of this office, has provided the Department with an important conservation mechanism in establishing the principle of sustained-yield forest management on federally owned lands and providing effective means for enlisting cooperation of private land owners.

Mineral development.—In aid of exploration by the Bureau of Mines for critical and strategic minerals, the Property Acquisition Division, through field attorneys, determined the ownership of the land being explored, and drilling contracts were made in the light of advice and instructions from the Mines Division. In aid of the experimentation by the Bureau for new or more efficient metallurgic processes, the Property Acquisition Division assisted in the acquisition of new plant sites and buildings and the Mines Division prepared the contracts for construction, supply, and operation of these facilities. By the same division of work, plants and rights-of-way were acquired for the vast expansion of the Bureau's helium production, and construction, supply, and operation contracts were executed. To enable the Bureau to undertake practical experiments in the production of synthetic liquid fuels from shale, coal, and natural gas the Legislative Division prepared legislation which became Public Law 290, authorizing demonstration plants. The problem of securing repayment to the Federal Government of expenditures to be made in the construction of the Leadville Drainage Tunnel, designed to dewater some of the richest lead and zinc mines in the country, was referred to the Solicitor's office at the beginning of the fiscal year. It was solved through the drafting and negotiating of royalty contracts which, by the close of the fiscal year, had been executed by nearly all of the operators benefiting from the project.

Reclamation and power.—Important blue prints for post-war use of land and water resources were drawn up in the legislative program of the Bureau of Reclamation with the aid of attorneys in the Legislative Division and of the Legal Division of the Bureau. This program included the Central Valley Soldiers Settlement Bill, now before Congress, providing a plan for the settlement of soldiers on lands receiving water under that project, authorization for the post-war construction of the Hungry Horse project (Public Law 320), and amendments urged to the pending rivers and harbors and flood control bills. The construction program for immediate war food purposes was forwarded by the passage of Public Law 152, drafted by the Department's attorneys, designed to increase food production through small reclamation projects, and by the negotiation of construction and supply contracts under seven war food projects reapproved by the War Production Board. The Bureau's Legal Division with the advice of the Conservation Division drafted important power contracts, particularly for the sale of energy from Boulder and Shasta Dams. An understanding was reached with the Bonneville Power Administration for the marketing of energy from the Grand Coulee Dam and a return of part of the Government's investment out of the power revenues. In the settlement of problems relating to the apportionment of waters, of particular note was the negotiation of the Belle Fourche compact between the States of Wyoming and South Dakota, ratified by Public Law 236. The apportionment of the North Platte River is now pending in the Supreme Court in the case of *Nebraska v. Wyoming and Colorado*, in which Bureau attorneys gave active assistance.

Territories.—Political and economic questions of major importance to the Territories demanded intensive consideration from this office, particularly from the Legislative Division, and from the legal staff of the Division of Territories. Assistance was given to the President's Committee set up to study further autonomy for Puerto Rico, in the preparation of legislative recommendations designed to achieve that objective, and to the congressional committees studying basic conditions in Puerto Rico. An Executive order was drafted to coordinate Federal activities in Puerto Rico. War and post-war economic measures for Puerto Rico which demanded attention included arrangements for the procurement and distribution of food, the consolidation of power and water facilities to meet military and post-war industrial needs, and the more equitable distribution of petroleum products. As the tides of war moved westward in the Pacific, new steps were taken toward completing the elimination of martial rule in Hawaii. Measures for the Virgin Islands included extension of social security services and Federal credit, and legislation for a public works program. Measures for Alaska included proposals for homestead opportunities for veterans and other settlers, for a development company to promote

post-war industrialization, and for the resettlement of evacuated natives. Legislation for post-war development of the territories was studied which became Public Law 320, amending the Hawaiian Homes Commission Act; Public Law 236, the so-called G. I. Bill of Rights, in which amendments were inserted to provide adequately for the returning veterans of the territories; and Public Laws 380 and 381, establishing a policy for Philippine independence and a commission to consider rehabilitation of the Philippines.

Fish and game.—The enforcement by the Office of the Coordinator of Fisheries of the orders of the Secretary for more effective use of fishery resources during the war required constant negotiation by the chief counsel of that office with interested parties, and, in connection with the pilchard program, the institution of 21 administrative proceedings against violators of the orders. The Conservation Division and the chief counsel, in cooperation with other officials of the Fish and Wildlife Service, drafted amendments and extensions of the departmental orders relating to the pilchard industry, the allocation of salmon in Alaska, the regulation of the salmon canning industry in Alaska, and the regulation of salmon operations in the Puget Sound area. Major conservation legislation drafted by the Legislative Division became Public Law 106, revising the Alaska Game Law to strengthen game control and extend protection to inland fishes, and Public Law 237 effectuating the 1942 provisional Fur Seal Agreement between the United States and Canada. The Conservation Division and the chief counsel of the Fish and Wildlife Service revised the regulations under the Alaska Game Law to effectuate Public Law 106 and the Alaska commercial fishery regulations to permit a maximum take this year. The chief counsel aided the temporary transfer of 400,000 acres to the military services, worked with the Office of Price Administration in preparing maximum ceiling price regulations for the raw fur industry, and drafted conservation agreements with other American Republics.

Indians.—Protection of Indian rights was the chief occupation of the Indian Division of this office during the past year. Litigation to eject trespassers who had for many years maintained ranches on the Pyramid Lake Indian Reservation in Nevada was brought to a successful conclusion when the Supreme Court declined to review the decision favorable to the Indians in *Depaoli v. United States*, 139 F. (2d) 225, cert. den., 321 U. S. 796, and the trespassers agreed to sell their improvements to the Pyramid Lake Tribe. Litigation against some 800 lessees in the Town of Salamanca, New York, who had defaulted in rentals due under long-term leases executed more than 50 years ago by the Seneca Tribe, resulted in nearly all of the defaulting lessees paying up the amounts due and entering new leases under which the Indians will hereafter receive rentals more commensurate with

the present value of the land. These two victories should go a long way toward commanding respect for Indian land ownership in quarters that have often considered Indian tribal lands as a kind of public domain open to all takers. Another old wrong was righted when, following a judgment in favor of the Menominee Tribe for \$1,700,000, the value of land promised the tribe in 1854 but never transferred to it, arrangements were completed for the use of this recovery to acquire the lands promised 90 years ago by a nation which still holds its word to be sacred. Further progress in the protection of Indian lands was made in Alaska, where a preliminary study of the status of Indian land claims resulted in the perfecting of arrangements for administrative adjudications of aboriginal claims within the public domain.

A large increase in important Indian litigation made necessary the assumption by the Solicitor's office of new responsibilities for brief-writing. Additional burdens were likewise cast upon this office in the field of taxation, where recent decisions have compelled reconsideration of various Indian tax liabilities under State laws. Further new responsibilities in the field of financing Indian land-use and industrial development were the result of congressional legislation at the start of the fiscal year extending the credit provisions of the Indian Reorganization Act to tribes which had not hitherto been entitled to the benefits of that act. Assumption of these new responsibilities was made possible by an extensive delegation of authority in other fields of Indian law and administration to the Indian Office and to the Legal Division of that office, on which have fallen greatly increased burdens, particularly in fields of land transactions, credit, law and order, and probate matters.

Government property and transactions.—To prepare for post-war property liquidation problems, the Legislative Division drafted a comprehensive bill, submitted to interested congressional committees, for the administration of surplus federally owned real property, and the Solicitor's office advised the Department's representative on the interdepartmental surplus war property committee. In the administration of the Department's order defining the Government's property interest in employee inventions, the Legislative Division drafted Public Law 357, authorizing the payment of rewards for inventions and suggestions, and the Mines Division prepared opinions on the relative rights of the Government and the employees, set up new procedures for reporting inventions to the Secretary and the Attorney General, and reviewed at least 109 new patent matters transmitted to the Department of Justice. The several divisions of the office, drafting, reviewing, and administering the contracts of the Department, studied and applied the numerous wartime Executive orders and in-

structions establishing contract procedures and provisions to meet critical labor and material shortages.

Departmental procedure.—To obtain more effective distribution and speedier conduct of the Department's business, the Solicitor's office was repeatedly called upon to analyze the Secretary's authority to delegate functions to the heads of agencies and to transfer functions among them. It drafted delegation opinions and orders concerning the Indian Office, Board on Geographical Names, General Land Office, Grazing Service, National Park Service, and the Bureau of Reclamation, and upheld the authority to transfer safety inspections of mines under Government lease from the Geological Survey to the Bureau of Mines and the authority to transfer, consolidate, and regroup, with one minor exception, all of the oil and gas functions of the Department.

Personnel organization.—To stimulate the interest of the Department's attorneys in the opportunities of Government service and in the possibilities for improvement of standards of work, the Solicitor put into effect a strict application of the Department's advancement-from-within policy and undertook the establishment of an in-service training program. Since January when advancement procedures were officially established, 13 of 17 vacancies have been filled from within the service. In organizing the in-service training program, as many as 20 different Government agencies were consulted. Courses are now planned, in cooperation with 13 other agencies, which will be open to lawyers newly entering the service, those in the service, and those returning from the armed forces.

The reorganization of the work of the office, previously approved, was carried on this year by the establishment of chief counsel positions in the Geological Survey, General Land Office, Grazing Service, and Office of the Coordinator of Fisheries, by the transfer of certain title work from the General Land Office to the Property Acquisition Division, by the reorganization of the Law Division in the General Land Office, and by the formal establishment of the fiscal and personnel law section in the Conservation Division.

the present value of the land. These two victories should go a long way toward commanding respect for Indian land ownership in quarters that have often considered Indian tribal lands as a kind of public domain open to all takers. Another old wrong was righted when, following a judgment in favor of the Menominee Tribe for \$1,700,000, the value of land promised the tribe in 1854 but never transferred to it, arrangements were completed for the use of this recovery to acquire the lands promised 90 years ago by a nation which still holds its word to be sacred. Division of Personnel

Supervision and Management

MRS. J. ATWOOD MAULDING, Director

THE conservation and full utilization of manpower have continued to be the objectives during the fiscal year 1944. In the development of programs toward these goals the Division has endeavored to strengthen the whole personnel structure in preparation for the tremendous post-war problems, such as post-war expansions, the returning veterans, and the demobilization of purely wartime activities.

The Division has continued the policy of searching the Department's own personnel for needed talent first, not only as a part of the recognized promotion-from-within policy, but to avoid as much as possible a drain on the outside manpower sources. This has resulted in filling from within the Department 60 percent of the vacancies above the entrance grade in the District of Columbia and 38 percent of those in the field. In the specialized war work, however, there has been a continuing demand for topographic engineers, geologists, engineering aids, and draftsmen in the Geological Survey; mining engineers, metallurgists, and coal mine inspectors in the Bureau of Mines; as well as special services in coal and other fields. The supply has not been adequate, which has made it necessary to request occupational deferment from military service for a number of those professional and specially qualified persons to carry on effectively the strategic work. Our requests for deferment have been principally in the 30 to 37 age group, interfering as little as possible with the military program.

Every effort has been made to recruit women and those not subject to military service. The fact that the Department now has approximately 9,600 women, nearly 3,000 more than at Pearl Harbor, points up this policy. At the same time the Department has released to the

armed services more than 6,200; 267 have returned to duty in the Department and 32 have paid the supreme sacrifice.

There has been a constant shortage of stenographers, typists, and other types of clerical help. As part of the effort to recruit them a joint recruiting program was arranged with the Civil Service Commission which was conducted in Virginia, West Virginia, and North Carolina. While productive it did not meet fully the demands. The help of the Department's own personnel in locating recruits has also been enlisted.

A broad training program has been conducted this year in an effort to increase the effectiveness of persons presently employed in the Department, to improve further the efficiency of our supervisors, and to orient new employees. In addition to refresher courses previously conducted for typists and stenographers, over 400 new employees have participated in the orientation program. Representatives from the bureaus in Washington, Chicago, Denver, and Salt Lake City took the trainers' course for job instruction training, which course they have given to over 200 supervisors in these cities. To provide a reserve from which to draw administrative talent the Department's administrative course was again given to carefully selected candidates. Three employees were also selected for the in-service administrative training program of the National Institute of Public Affairs.

Four separate promotional examinations were designed and conducted in the Division, in which 436 employees participated in Washington, Chicago, and Denver. These were for the purpose of establishing the eligibility of clerks for higher grade vacancies, and messengers for clerical positions.

The classification office has reviewed and allocated 16,700 positions during the year, and has made numerous surveys of groups of positions, some in collaboration with the Civil Service Commission. Specifications have been prepared and promulgated for various classes of field positions, as part of a long-range plan for covering by specifications all of our typical field positions.

Consonant with the Stabilization Act the Division has endeavored to keep rates of pay for the trades and occupations at the prevailing level and wage board procedures have been extended to accomplish this.

Even under the abnormal conditions of wartime every evidence is that the morale of the Department's personnel is high. Information regarding recreational opportunities, housing, child care and so on has been disseminated; by cooperation with the Public Health Service chest X-rays were made available on a voluntary basis; health lectures were held; the welfare and credit union services have been available. While turn-over has been above normal, we have found very few individual grievances.

In order to give improved and more expeditious service to the three bureaus of the Department which were transferred to Chicago in 1942, a branch office of this Division was established there in January 1944. The results of bringing the departmental staff closer to the operating officials has been most gratifying.

During the fiscal year there were 18 retirements for age, 74 optional, 43 for disability. There were 21 employees reemployed after having reached the retirement age.

At the close of the fiscal year there were 43,879 employees in the Department, 4,858 in the Washington metropolitan area, and 39,011 in the field.

As part of an improved over-all program of the Division, plans have been going forward looking to more decentralization of paper work and the placing of more responsibility on the bureaus and offices, while retaining central control over policies and sound personnel standards and procedures. The first major delegation of authority was made in May 1944, to the Bureau of Reclamation in Denver. Others are in process. The Division is girding itself for the challenging tasks ahead.

Interior Department Museum

H. L. RAUL, Museum Curator

WITH vast national resources under the administration of the Department of the Interior and directed toward sure victory and post-war requirements, the vital contributions of the Department to these ends are illustrated graphically in the Interior Department Museum. The museum, operating in direct contact with the public, reflects the history, aims, and the current activities of all of the bureaus of the Department.

Its educational character is well attested by the popular use made of the museum by the general public, members of the armed forces, educators, and students.

The museum was visited during the past year by approximately 45,000 persons. The visitors' register recorded visitors from every State in the Union with the single exception of Nevada. Registrations were received also from Alaska, Hawaii, Puerto Rico, Argentina, Australia, Canada, China, Colombia, Cuba, England, Ecuador, France, Haiti, Holland, Iceland, Italy, Mexico, Mongolia, New Zealand, Scotland, Sumatra, Sweden, Switzerland, Panama, Paraguay, Thailand, Venezuela, and Yugoslavia.

In cooperation with the bureaus, revisions have been made in the display cases to reflect current conditions. During the past year the museum has served, upon request, numerous agencies including American Air Forces, Corcoran Gallery of Art, Fort Belvoir Engineers' Board, National Institute of Public Affairs, Navy Department, Public Buildings Administration, State Department, United States Service Organizations, Veterans' Administration, and the War Department.

A collection of antique Indian baskets, selected from the Colburn Collection of Indian Basketry, was exhibited, by request, at the Toledo (Ohio) Art Museum during the month of January. This exhibit proved its popular interest by a granted request for extension of the exhibition period for an additional month.

A silhouette, which is ten feet in length and which depicts "The Driving of the Golden Spike" at the completion of the first trans-continental railroad, at Promontory Point near Ogden, Utah, on May 10, 1869, was designed in the museum and installed in the General Land Office Gallery. Books added to the museum collection include *A Manual on the Origin and Development of Washington*, by H. Paul Caemmerer, Ph. D.; *The Crafts of the Ojibwa (Chippewa)*, by Carrie A. Lyford; and *Seneca Split Basketry*, by Marjorie Lismer.

Throughout the year conducted tours of the museum galleries were held for teacher groups and public and private school classes. A pertinent commentary on the educational value of the museum is indicated by the continuous use of the galleries for school purposes. Notwithstanding transportation difficulties which frequently prevented entire school classes from attending, the teachers visited the museum, singly and in groups, to avail themselves of material for arranging study courses on conservation, historical and other subjects pertaining to various activities of the Department. Numerous inquiries on the part of the general public have been complied with daily at the information desk. Many requests have been received from visitors in the uniforms of our armed services.

POST-WAR

In connection with post-war potentialities of the museum, certain improvements are desirable. The museum specimen collections have been largely augmented during the past several years. Much of this important new material now is held necessarily in storage, and, therefore, is not readily available for display or study purposes. Additional space will be needed to provide for these collections and for other important exhibit material. Furthermore, while present display cases currently are subject to additions and revisions to reflect the current bureau activities, space restrictions are evident.

As during the course of the war the facilities of the museum have been made available for the training of hundreds of departmental personnel in modern first aid techniques, developed and taught by the Bureau of Mines, a post-war expansion of the use by the bureaus of the museum facilities and equipment is suggested, should the need arise, in connection with possible post-war training and rehabilitation programs for returning war veterans, particularly those who were past employees of the Department. In this field the museum technical workshop could well serve as a nucleus for training courses in expert model-making, visual and graphic techniques, and other specialized training useful both to the veterans and to the Department.

From the post-war historical standpoint, when victory is won, many of the museum displays will require final revision and re-designing to illustrate and record the vital importance and the amazing scope of essential activities accomplished by the Department and under its auspices in the prosecution of the war. Post-war potentialities for the museum indicate that when the full story of the Department's participation in this great crisis in the life of our Nation can be unfolded in its entirety, by modern museum methods, this new great chapter in the history of the Department appropriately will require increased exhibit space for its presentation. It will comprise an inspiring story of vast achievement in many fields vital to victory. In reflecting this story for permanent visualization and reference, desirable post-war museum results are anticipated for the Department and for the public.

It will comprise an inspiring story of vast achievement in many fields vital to victory. In reflecting this story for permanent visualization and reference, desirable post-war museum results are anticipated for the Department and for the public.

Division of Information

JOHN E. RYCKMAN, Director

DURING 1944 the Division of Information has endeavored to keep the public abreast of what the Department, as custodian of the Nation's natural wealth, has done, not alone in mobilizing our resources for war, but in planning for the post-war period.

The informational programs of the various Bureaus and Offices having to do with the development and wise use of such natural assets as metals, power, fuel, helium, food, land, timber, and fisheries, have been under the direction of this Division and channeled through it to the public. This Division is comprised of editorial, radio-television, photographic, and publications sections.

By appointment of the Secretary of the Interior, the Director of Information has acted as security officer for the Department in safeguarding secret and confidential material that might aid and comfort the enemy, as clearance officer for publications with the Office of War Information, and as editor in chief of the Interior War Records Project, now in the process of being compiled for the future use of the Government in time of emergency.

The Division has been responsible not only for passing upon the editorial content and format of pamphlets, booklets, and other publications released by the Bureaus but also for deciding whether such printed matter should be issued at all during the emergency. In this connection, considerable savings in vital paper stocks have been effected through abridging many publications and restricting others for which there is not a definite war need.

The fiscal year has seen the assignment to the Division of the task of producing "Inside Interior," a monthly publication designed to keep the Department's own employees informed about its activities, as well as to enable the more than 6,000 employees in the armed services to maintain contact with their former associates.

The Division was also responsible for editing, designing the format and supervising the printing of the Secretary's annual report.

RADIO-TELEVISION SECTION

Under the general supervision of the director of information, the radio-television section, operating the only modern broadcasting and recording studios in the Government, has in the past year been increasingly called upon to serve Federal war agencies.

Principal use of these facilities was made by the armed services for the preparation of special training programs, including electrical transcriptions, direct broadcasts, and the production of slide film and film strips. These training productions were for use in every theater of the war.

More than 200 hours of secret and confidential utilization of radio-television section facilities were spent in the production of special materials for the Office of Strategic Services and for the War and Navy Departments.

A total of 29 different languages have been used in productions put out in the Section in the past year and broadcast as a part of the psychological war activity.

Diplomatic representatives of all of the United Nations and many distinguished war visitors have been presented by direct broadcast and by radio transcriptions both to American and foreign audiences. Notable in this category were a special broadcast of the arrival in Washington of General Charles DeGaulle, prepared for European listeners; the dramatic swearing in of Sergio Osmeña as President of the Philippines; broadcast for European and American audiences of special interviews with His Royal Highness, The Amir Faisal of Arabia and his royal entourage; a special broadcast to the men of the Marine Corps by General Holcombe upon his leaving his position as Commandant of the Corps for special duty. Representative of the type of series broadcasts produced in the section were the 482 special broadcasts by electrical transcriptions made by the Free Thai Minister, Mom Rajawongse Seni Pramoj, and shortwaved to the people of Thailand.

While these special services are being rendered to war agencies outside of the Department, our own bureaus and offices have in no wise been neglected. Programs, transcriptions and special recordings have been made in this period for the Solid Fuels Administration for War, the War Relocation Authority, Petroleum Administration for War, Board on Geographical Names, Bonneville Power Administration, Bureau of Reclamation, Bureau of Mines, Division of Territories and Island Possessions, Coordinator of Fisheries, National Park Service, and Geological Survey.

Within the past year, the radio-television section has cooperated in the preparation or production of radio and transcription material with most of the Federal departments and other agencies.

PUBLICATIONS SECTION

This is the first complete fiscal year during which the publications section has concentrated upon editing and publishing rather than upon the procurement of printing. Copy has not been merely prepared for the printer. It has been examined editorially, and faulty manuscripts have been revised or returned to the issuing agencies for corrections. This change in practice has been justified by the results, one of which is that the public receives clearer and better-selected reports of the Department's findings.

The section chief has assisted in effecting clearance of publications, under the Office of War Information Regulation No. 8 and has also assumed greater control over all departmental and bureau publications as regards format. Economic practices in the printing and processing of all information material have been enforced and appreciable economies have resulted.

Much remains to be done in improving the appearance and the editorial content of our publications, and it is planned to make such improvements as rapidly as circumstances permit.

PHOTOGRAPHIC SECTION

Most of the offices and bureaus of the Department have continued to utilize the facilities of the photographic laboratories to effect considerable savings in descriptive matter in official reports. The photographic section has devoted its time almost exclusively to furnishing photographs and illustrations having a direct bearing upon activities related to the war.

In addition to work for the Department, it has continued to cooperate with other governmental agencies in the production of illustrative material involved in their war programs. It has also furnished pictures for textbooks, guidebooks, pamphlets and travel literature requested by scientific, trade and other magazines and publishing organizations.

LETTER OF TRANSMITTAL

THE SECRETARY OF THE INTERIOR

HAROLD L. ICKES, *Secretary*

MY DEAR MR. PRESIDENT: This annual report seeks to show how the mobilized resources of this Nation contributed to victory over the Axis nations. It also reveals how near that victory came to being a Pyrrhic one.

At the beginning of the period here covered we were still searching the earth for the minerals that were needed in ever-increasing quantities to equip our own fighting forces as well as those of our allies. While we were searching for these minerals with meticulous diligence we were spending them with wanton prodigality.

By the end of the period of this report our natural resources had been tapped, processed and sent to the battlefields in such prodigious quantities that Nazi Germany already had collapsed, and Japan was about to do so.

But the drain on our national natural assets had been staggering.

Only nine of the major minerals remain in our known domestic reserves in great enough quantity of usable grade to last 100 years or more. Our known usable reserves of 22 essential minerals have dwindled to a 35-year supply or less. Our assured domestic deposits of petroleum would last from 14 to 20 years at our present rate of use, but our prospects of making good on some of our losses in oil are fairly good.

In some other fields of conservation, the damage of war has been just as real, though it may prove to be temporary, and certainly it has been less severe. We were obliged to complete our huge power-production facilities ahead of schedule to energize war plants where there was no comparable peacetime manufacture to sustain the plants after the war. We must find new markets for those facilities or suffer the consequences of unemployed power which is scarcely more healthful economically than are unemployed men.

The war has reduced much of Europe and Asia to such a shambles, physically or economically or in both respects, that great populations abroad cannot provide the essentials of existence for themselves.

But they must be maintained so that, if for no other reason, they can sustain our economy. We must provide these peoples with as many of their needs as we can provide, especially food. We equipped ourselves during the war to produce more food, but not enough more to meet the postwar demands at home and abroad. The inadequate expansion of our agriculture is just as certainly attributable to the war as is the increased demand for food. We had to put as little material and work as possible into irrigation facilities so that we could put as much as possible into dams and power plants that would produce fighting equipment.

It is only fair to interrupt this gloomy recital long enough to say that some advantages, aside from military victory, also came our way between the beginning of the war and my transmittal of this report. The danger of defeat sped our improvement of new methods of exploring for mineral deposits, and for processing ores.

We have acquired jurisdiction over the Continental Shelf, which is about 760,000 square miles of underwater land from which we may replenish some of our depleted mineral reserves. Other Federal agencies have discovered or improved certain techniques and devices, radar among them, that will enable us to explore the shelf and to extract its riches more quickly than we could have hoped to do had science developed at its peacetime pace. We have several advantages in the programs which this Department formulated for the express purpose of regaining our balance in conservation after victory. We have begun an accounting of the minerals that we still have in our reserves, and when the tally is complete it will be as valuable to us as a clear statement of its assets would be to a corporation. We have made studies that show what the prospects of success are for various industries that might buy and use the power that we produce when war contracts are cancelled. These studies, which were made in co-operation with other Federal agencies, States, municipalities, colleges and industries, tell prospective contractors for our power which raw materials would be available to them, in what probable quantities, at what probable prices, what markets they might expect, and many related facts which may hasten the sale of power by facilitating the prospective buyers' preliminary surveys. We have already contracted for the sale of some power and the outlook for additional contracts is not discouraging. Within the past fiscal year, also, we have made much headway toward achieving regional development.

This is about as accurate as so brief a statement of our principal gains and our principal losses could be, but we cannot use it as a balance sheet. The losses that are listed are indeed losses; the ores that we have taken out of our mines will not creep back into the ground, but the "gains" are not so conclusively gains. Oil deposits in the Continental Shelf remain an unknown factor. We will have

to make a survey to find them. Processes for beneficiating low-grade ores will not, of their own accord, extract an ounce of metal, and many of the other "gains" that I have listed are equally inconclusive. They are merely potential gains. We can use them to our advantage or we can let the opportunity to use them escape us. I hope that a more detailed view of what is left of our diminishing resources will convince all of us that we must make amends for our losses by squeezing the last drop of advantage out of every potential gain that we have at hand.

The nine minerals that are plentiful enough in our known domestic reserves to last 100 years or more at a normal rate of use, are iron ore, nitrogen, magnesium, salt, bituminous coal and lignite, phosphate rock, molybdenum, anthracite, and potash. There are only nine of them out of the long list of metals that we must get at home or abroad in quantities as great as we need in order to hold our high place among the nations.

Even if we had a hundred years' supply of all of the metals that we need, that would not mean that we would be safe for a century. In the games of war and trade which nations play, a century is only a little while. Military and economic campaigns have been planned that far ahead. Consequently, it behooves us to learn the true meaning of our meager supply, which is not that we will be weak in a hundred years, but that we are relatively weak now.

Neither does the possession of a particular metal in great quantity guarantee that we can have all of the products that can be made of that metal so long as it lasts. We must have, in addition, the alloys that go into those products. Manganese is just as important as iron is in the making of most steel, and we have only a 2-year supply of usable manganese ore in our proved domestic reserves. So are vanadium and tungsten as necessary as iron is in making certain steels that are essential in time of peace or war; but we have in our proved domestic reserves only a 7-year supply of vanadium, and a 4-year supply of tungsten. We have less than a 35-year supply of 19 other minerals; among them, petroleum, copper, lead, tin, zinc, nickel, bauxite, chromite, and cadmium. Our reserves of high-grade coking coal are low. We do not know just how low because our knowledge of reserves is not yet so extensive as it should be. Our highest-grade iron ore, the kind that can be mined and smelted most cheaply, would be exhausted in about 22 years at a normal rate of use.

The past has not taught us how severely we can be penalized for a lack of metals at the outbreak of a war. It has taught us only that such a dearth can put us to a severe test. That is the worst that has happened to us; because we have always had time between the threat of war and actual war to get the materials which we lacked, or to

find substitutes for them. But we cannot henceforth count on any appreciable lapse of time between the threat and the event of a war.

Neither has the past taught us how terribly we could be made to suffer, from a scarcity of minerals, even in time of peace. We have never had to use substitutes for the commonest metals, nor have we paid unbelievable prices for such necessities as automobiles and refrigerators. But that is what we would have to do if we used the last of our high-grade ores, and had to import metals over great distances or extract them from our own submarginal reserves. Transportation of heavy goods is costly. So is the treatment of low-grade ores, and the consumer would pay the cost. I think that most Americans would like to see us take preventive measures against these threats while there is still time and I urge the necessity for it.

Many of the measures that would conserve the minerals that we have, or give us access to a larger supply, are very well known. We should stockpile; that is, we should import emergency supplies of metals that are scarce here, and store them, and we should add to that reserve from our own surpluses whenever we produce metals in greater quantity than we use them. We should intensify our explorations for new reserves. Improved instruments and methods would make our explorations effective and relatively cheap.

We should intensify our experiments in extracting metals from low-grade domestic ores by means of new and improved processes. If we wait until our high-grade ores are gone, and only then begin to use those of low-grade, processing will be very costly and uncertain of profitable results. If begun in advance of actual need, most experiments are not gropings after undreamed of methods. They are, instead, very practical proceedings by which well-known laboratory methods are improved enough eventually to make them profitable in large scale production. There is no mystery about how to make synthetic gasoline, for example. We can make it now, but the processing costs about 15 cents a gallon. Gasoline can be made from crude oil by means of a process that costs only about 5 cents a gallon. If we should drop our experiments in making synthetic motor fuel, and begin to produce it after our petroleum had vanished, by the methods which we know, every motorist would have to pay for a process that would be three times as expensive as that now in use. We should continue our experiments in all of our processes for beneficiating low-grade ores for the same reason: that we should continue our experiments with synthetic gasoline—so that they will be cheap enough to use when we have to use them.

We should also find more efficient methods of reusing scrap metals, find out how we can induce operators to take more oil from nearly dry wells, and act accordingly. We should regulate production methods so that waste in the process of mining will be minimized, and we

should do all that we can do to prevent the unnecessary use of our scarce and essential reserves. Our continued waste of natural gas is inexcusably profligate. Another case in point is coking coal, now being used where ordinary coal would be adequate, and which should be reserved for steel making, in which it is essential.

Above all we should act upon the advice of competent researchers, scientists, and technologists whose official business it is to keep us informed about which minerals we need and how to get them. No list of critical and strategic metals can remain accurate very long. A new alloy becomes indispensable, an old one becomes passe, a foreign source of supply becomes more accessible to us, and another becomes less so. Consequently, we cannot formulate any policy which would be applicable at all times and on all occasions.

The measures that I have recommended would help us to strengthen our position, but two other programs that are under way in this Department almost certainly will add more to our wealth and conserve our resources more effectively than any measures would that I have discussed thus far. These are a program for regional development and another for the exploration of the Continental Shelf. The concept and theory of regional development were discussed recently in hearings before a Senate committee, and these proceedings were published. Some of the facilities that could be administered in developing the resources of the Missouri Valley are under construction, and we are making studies that may result in the full and coordinated development of 14 other great river basins. News of these activities has been published, too. Consequently, there is relatively wide-spread understanding of what regional development is, of what is being done about it, and what it is intended to accomplish. But there has been almost no discussion of our impending exploration of the Continental Shelf, one of the Nation's most important acquisitions. If we discount the obvious fact it is uninhabited and uninhabitable, the Continental Shelf ranks with the lands which we acquired by the Louisiana Purchase, or by the opening of the West, or by the purchase of Alaska. And the exploration of this vast underwater area will be an important historical event. We will make new applications of modern science and set scientists to work in cooperation on a scope that has been surpassed on no single undertaking other than the project for the development of atomic energy.

Approximately described, the Continental Shelf is all of the ocean floor around the United States and its Territories that is covered by no more than 600 feet of water. The whole area is almost as large as the area embraced in the Louisiana Purchase, which was 827,000 square miles, and almost twice as large as the original 13 colonies, which was 400,000 square miles. Along the Alaska coastline the shelf extends several hundred miles under the Bering Sea. On the

Eastern coast of the United States the width of the shelf varies from 20 miles to 250 miles, and along the Pacific coast it is from 1 to 50 miles wide.

Two Presidential proclamations assert our sovereignty over the mineral resources of this ground, and our jurisdiction over the fishery resources of the high seas contiguous to our lands. The food and mineral resources of these areas are worth billions of dollars. Experts in the geology of oil lands would not be surprised if we found 22 billion barrels of oil—more than we are sure that we have on the continent—beneath one small part of the shelf that reaches into the Gulf of Mexico. Geologists also think that the shelf will yield rutile, sulphur, ilmenite, chromite, monazite and other heavy minerals. Their expectations are based on geologists' observations and on geologic reasoning. They have "tracked" lines of oil-bearing formations in the earth up to the shoreline, and they have good reasons to believe that the lines continue along the bed of the ocean. They also know which geologic processes create oil, and the shelf has undergone those processes.

The great wealth in this new acquisition is not something that we may take in a few decades or a few centuries. We can begin taking it within a relatively short time. It is true that oil has never been recovered from fields that are distant from the shore and under 600 feet of water, but it has been recovered from a field that is a mile off the Louisiana shore and from another that is 2 miles off the coast of Texas. Techniques for recovering it from deeper waters appear to be possible to our scientists and engineers, and they must appear possible also to at least one oil company, for it has explored the waters of the Gulf of Mexico for oil up to 26 miles off the Louisiana coast.

This Department has been assigned to explore the shelf, and we have developed our plans so far as we can develop them without knowing how much money the Congress will appropriate for the work. We have acquired some of the extraordinary instruments that will be used; we are building or redesigning others. We are formulating a program for cooperative work by geophysicists, geologists, and engineers. Their work will be carried on partly aboard vessels and partly in submarines, and diving bells, and in airplanes. The cost of the survey may run to several millions of dollars if we include the cost of ships and equipment that have served their war purpose for the Navy and which are still in the Navy's possession. Even if we did count the cost of these essentials in the cost of the survey, which would be doubtful bookkeeping, the shelf would still be cheap. Alaska cost us \$7,200,000; the Danish West Indies, \$25,000,000; and the Louisiana Purchase amounted to \$27,000,000. The Continental Shelf cost only the forethought that was required to assert our sovereignty over it.

Regional development is not a new theory of conservation, but

rather an improved technique for developing, using and conserving our resources by the usual means—but doing it better, cheaper, faster, and to better purpose. It is the kind of logical next step in conservation that mass production was in production. We would continue to build dams, power plants, reservoirs, irrigation facilities, and other adjuncts of conservation. We would improve navigation, advance the propagation of fish and wildlife, and create and preserve recreational facilities. We would provide for flood control and for the alleviation of stream pollution, but we would not plan any facility or program singly, nor would we be content to derive from it only those benefits which a single facility or program alone would provide. Instead, we would draw into one plan all of the dams and other facilities that a large region would need to develop and conserve its resources, build each unit, not as a thing in itself, but as a part of the whole, and we would design these unified projects to be operated as a single conservation-and-development program for the benefit of an entire region.

The great facilities which we have recently begun to build, especially those in the Missouri Valley, were designed as parts of a program of that kind. But these facilities and others that will be built later will not work as one unit of their own accord, regardless of how well-designed they may be. They must be operated as a unit, and this Department has helped to prepare for that kind of operation. The Senate Committee on Irrigation and Reclamation was given all of the guidance and information which this Department's extensive experience in conservation enabled us to give, when that committee held hearings on the Murray bill (S. 555). We are prepared to appear before any other congressional committee that may need us.

I approved of the principal aim of the Murray bill, which is to provide by statute that all of the conservation facilities in the Missouri Valley shall be used in coordination. However, I believed that the law should be amended to make possible similar benefits to the inhabitants of other river basins if they wanted them, so I recommended certain revisions in the bill which would assure the continued usefulness of those Federal organizations, within this Department and others, that now successfully administer the established conservation policies of the Nation. My recommendations have been published as a Senate document, and they have been particularized in a bill which this Department has prepared and proposed as a substitute for Senate bill 555, so I will not repeat them here.

There has been so much honest misunderstanding and deliberate misrepresentation with respect to my attitude on the development of our great river valleys that it may be worthwhile to make a brief statement here. I am not only in favor of the full and diversified development of our river valleys, I was one of the first men in public

Eastern coast of the United States the width of the shelf varies from 20 miles to 250 miles, and along the Pacific coast it is from 1 to 50 miles wide.

Two Presidential proclamations assert our sovereignty over the mineral resources of this ground, and our jurisdiction over the fishery resources of the high seas contiguous to our lands. The food and mineral resources of these areas are worth billions of dollars. Experts in the geology of oil lands would not be surprised if we found 22 billion barrels of oil—more than we are sure that we have on the continent—beneath one small part of the shelf that reaches into the Gulf of Mexico. Geologists also think that the shelf will yield rutile, sulphur, ilmenite, chromite, monazite and other heavy minerals. Their expectations are based on geologists' observations and on geologic reasoning. I approved of the principal aim of the Murray bill, which is to provide by statute that all of the conservation facilities in the Missouri Valley shall be used in coordination. However, I believed that the law should be amended to make possible similar benefits to the inhabitants of other river basins if they wanted them, so I recommended certain provisions in the bill which would assure the continued usefulness of those Federal organizations, within this Department and others, that now successfully administer the established conservation policies of the Nation. My recommendations have been published as a Senate document, and they have been particularized in a bill which this Department has prepared and proposed as a substitute for Senate bill 555, so I will not repeat them here.

There has been so much honest misunderstanding and deliberate misrepresentation with respect to my attitude on the development of our great river valleys that it may be worthwhile to make a brief statement here. I am not only in favor of the full and diversified development of our river valleys, I was one of the first men in public

life to propose and advocate such a development. There are few if any differences between my views on the Murray Bill and those of the author.

My principal objection went to the question of administration. Whether the administration should be in the hands of a single administrator or of a board is not so much a matter of principle as it is of practicality. I cannot concur in the disposition that some people have to set up so-called independent boards that can go their own way in criss-cross fashion without any effective control by a principal executive who has the power to see to it that there shall be no waste or overlapping or unnecessary expenditure of money. It is airily suggested that the President, the most overburdened executive in the world, can undertake this additional little chore.

I do not believe that such a burden should be laid upon him. In the end there will be a number of these separate administrations, some of which will overlap as to functions and as to areas to be administered. Unless we are careful these could result in bad administration and worse feeling. As our Government is constituted today, it seems to me that these administrations should clear to the President through the Secretary of the Interior. This Department has had more experience than any other in this type of administration. To clear through the Secretary of the Interior, I do not suggest any lack of proper local autonomy. The history of this Department, especially during the past 12 years, has amply demonstrated our belief in local autonomy to the fullest possible extent consistent with proper coordination and sound administration. Unsupervised and too diffuse local autonomy might mean a series of political grab-bags that would discredit the whole theory of river valley authorities. I do not happen to believe in administration by a debating society and I doubt the efficacy of a shibboleth when it is expected to roll up its sleeves and go to work, day after day, to do a varied and intricate job for the people.

The Congress eventually will decide how these coordinated facilities shall be administered. Meanwhile we are so planning that they can be operated as single developments when a suitable policy has been formulated. Several bureaus and offices are cooperating in these plans so that the preservation of fish and wildlife, the creation of recreational facilities, and the other aims of thoroughgoing conservation will not be overlooked, but the Bureau of Reclamation is planning and building the principal facilities, and is coordinating the program.

The Bureau of Reclamation

This Bureau has presented to the Congress a postwar development inventory of 415 irrigation and multiple-purpose projects in the 17 States that are west of the one-hundredth meridian or are bisected

by it. More than 100 of them are in operation, or have been authorized, or are under construction, and preliminary studies of others have been completed. Among the projects that have been authorized are 29 of those in the Bureau's program for basin-wide development of the Missouri River Valley.

These projects, calling for the construction of dams, irrigation systems, power plants and reservoirs for flood control and other purposes, would create employment for thousands of returning veterans and others, would open new lands to settlement, encourage the development of new business and industry, provide protection against drought and flood, increase Western purchasing power, and would, in many other ways, contribute to the National welfare.

Here, briefly summarized, is what the developments that are proposed by the Bureau of Reclamation would do:

1. Provide almost 200,000 new irrigated farms for settlement by veterans and others. (Construction of proposed projects would bring nearly 11 million acres of new land under irrigation and provide supplemental water to another 11 million acres which now have inadequate water.)

2. Provide jobs at the peak of employment for more than 400,000 workers at construction sites and for thousands of others working in factories, mills, mines, and in transportation throughout the country to supply the necessary materials and equipment.

3. Provide huge blocks of low-cost power for the development of natural resources, of new industry, and of business.

4. Create opportunities for farm workers, tradesmen and professional people in the new and expanded rural and urban communities that would result from such developments.

5. Greatly increase the purchasing power of the West for the products of other sections of the country.

6. Diversify and bring into greater balance the economy of these Western States in caring for an increased population.

Many other benefits would accrue from this program, not only to the persons who would be directly affected by the developments that it provides for, but to the whole Nation as well.

The first of the coordinated programs for regional development—that for the Missouri Basin—was approved by the Congress during the present fiscal year, and the Bureau is now completing studies and reports on 14 other major river basins in the 17 Western States. These studies also embrace tributary basins and many scores of individual projects.

It is from these studies and from 43 years of experience in developing the land and water resources of the West that the postwar program of the Bureau has emerged. The construction of the projects in the inventory will be dependent upon the action of the Congress in

appropriating the necessary funds. Based on 1940 price levels, the estimated cost of constructing all of these projects would be approximately 5 billion dollars, but the major portion of such costs would be returned to the Federal Treasury from payments for irrigation water, proceeds from the sale of power generated at the projects, and otherwise. There would be, in addition, many indirect benefits that could not be evaluated in dollars and cents. The benefits to be derived would return many times over the cost of such a development program.

An understanding of the impact that such a program would have upon the Nation's peacetime economy can be gained from a review of what the projects that are in operation did during the war to help the United States to establish an unparalleled record of production.

Farmers on more than four million acres of land that is irrigated by Bureau facilities produced food, forage and fibre crops valued at more than \$411,000,000 in 1944, setting an all-time record. As the result of the urgency of its war-food program, the Bureau, since 1941, has increased the irrigated acreage served by its projects by 759,000 acres. Of this total increase, 125,000 acres were brought under irrigation during the past fiscal year.

The Bureau's production of electric power has been equally spectacular. At the outbreak of the war we faced a critical shortage of power with which to meet the huge demands of rapidly increasing war production. We actually had a third less power available than the Axis countries had, and that deficiency threatened to retard seriously the production of munitions and equipment that were desperately needed by our armed forces.

How the Nation overcame that power deficiency is one of the stirring chapters in the history of the war. Our production of electric energy was stepped up to unprecedented levels, and the major contributors to that greatly increased output were the hydroelectric plants of the Bureau of Reclamation in the West—the plants at Grand Coulee, Boulder Dam, and elsewhere.

In 1941, Bureau plants had an installed capacity of 828,000 kilowatts. By June 1945, that capacity had been increased to 2,439,300 kilowatts. In speaking of the Bureau of Reclamation it should be borne in mind that the Tennessee Valley Authority, which is a separate agency, is not included. The power output of Bureau plants has quadrupled since the attack on Pearl Harbor. That output this year totaled nearly 14 billion kilowatt-hours, making the Bureau the largest single power-producing agency in the world. The bulk of its output went to war plants—aircraft factories, shipyards, chemical and metallurgical plants, ordnance works, steel, aluminum and magnesium plants, and also to cities, Army airfields and other military installations. It was also used to pump water for irrigation, and to electrify rural homes. From the Grand Coulee-Bonneville system

alone came the power for processing one-third of the Nation's aluminum output for airplane production. Grand Coulee Dam also furnished the huge blocks of power needed for the construction and operation of the Federal government's "mystery war plant" near Hanford, Wash., one of the producers of the atomic bomb.

In these ways the projects of the Bureau of Reclamation contributed to the winning of the war. Now we must help to adjust the Nation to the conditions of peace. Our service men and women are coming back to seek jobs, to look for places to start farming, to practice trades, to establish themselves in business. We must help to keep our great industrial plant at full production, and to maintain the national income at a high level. To accomplish that, and to provide increased opportunities for our people we must apply the lessons learned during the war and bring to full development the natural resources which the Nation still possesses.

The program proposed by the Bureau of Reclamation for developing on a basin-wide scale the great river valleys of the West has that as its objective. Its operating projects have already pointed the way in showing what can be done through coordinated effort and intelligent planning. Similar projects will provide a solid economic foundation on which to build a stronger America, and afford the opportunities for richer, happier living for thousands of people in the years to come.

We cannot end a discussion of the world's largest producer of hydroelectric power without noting that in the harnessing of atomic energy we have a new challenger of the place of electricity. But when we have acknowledged its arrival, that is about all that we can do. We know that atomic energy has been used for the benefit of mankind, although not on a commercial scale. We do not know whether it could be used economically in industry. We presume that it will be used in industry, but we do not know even approximately how long it would take to develop it for such use. In a word, we do not know enough about it to justify an exhaustive discussion of the effect which atomic energy may have upon hydroelectricity.

The Division of Power

With the postwar period on the horizon the activities and responsibilities of the Division of Power have increased commensurate with the many complex problems inherent in the operations and the marketing of power from the largest aggregate of hydroelectric capacity in the world. As of June 30, 1945, the total installed capacity of the plants involved, was 3,107,300 kilowatts with a total generation during this fiscal year of 18 billion kilowatt-hours, more than five times the 3,672,995,000 kilowatt-hours produced by all of the power plants under the jurisdiction of the

Department in 1940. Again these figures do not include the production of TVA, a separate authority.

The Flood Control and the River and Harbor Acts placed additional responsibilities upon the Division. They directed the Secretary of the Interior to dispose of the power that is generated at the dams constructed by the Corps of Engineers. The ultimate installed capacity of these authorized projects will be more than 7,200,000 kilowatts.

In preparing for the transition to a peacetime economy, while meeting the needs of war, studies have been undertaken in order that the power that is under the jurisdiction of this Department may be disposed of in accordance with the policy that the Congress has forged during the past four decades—that is, in such a manner as to encourage the most widespread use at the lowest possible rates to consumers, consistent with sound business principles, and with a preference to public bodies and cooperatives. Consideration is also being given to the problem of the integration, with our Federal power projects, of fuel-operated generating plants that were built to serve some of our large military establishments and war plants.

The Division has reviewed or has participated in the determination of the allocation of costs of dams such as Grand Coulee, in the establishment of rate schedules, and in the negotiation of various contracts for the sale of power by the Bonneville Power Administration, the Bureau of Reclamation, and the Southwestern Power Administration. It assisted the Solicitor's Office in the negotiations for the disposal of the Hetch Hetchy power by the city of San Francisco in accordance with the terms of the Raker Act. It cooperated in the studies and negotiations of the Bureau of Reclamation for the proposed acquisition of the power facilities of the Salt River Water Users' Association in Arizona and of the Minidoka and Burley power facilities in Idaho in an effort to bring about unified operating systems and to make possible lower rates. It also assisted the Puerto Rico Water Resources Authority and the territorial government of the Virgin Islands in connection with their power problem.

The Bonneville Power Administration

America's best insurance against the threat of possible economic chaos is its supply of human and natural resources, and the ability to convert both into national wealth under a system of free enterprise. The Pacific Northwest, with its inexhaustible supply of hydroelectric power and its still untapped reserves of some natural resources, will be expected to contribute much toward a balanced economy. In view of this, and recognizing also that difficulties would be caused by cut-backs in war industries, by reconversion, and by the dislocation of industries after the war, the Bonneville Power Administration, early

in the fiscal year 1945, set out to make a realistic appraisal of the job ahead.

A brief analysis of the Administration's war loads indicates that possibly as much as 600,000 kilowatts, or approximately half of the Administration's total production, may become available for re-marketing. In order that this power may be marketed as quickly as possible and to prevent, insofar as is possible, any loss of the Pacific Northwest's wartime industrial gains, the Administration is devoting considerable effort to an extensive program of market and system development. The marketing program is directed toward the development of new power outlets for industries that will directly or indirectly provide jobs for returning service men and displaced war workers.

Cooperative research programs have been established with major educational institutions in Oregon, Washington, Montana, and Idaho to study and develop the potentialities of farm electrification, of electric home heating, or electric generation of processed steam and of other projects that, if developed, would require electricity.

Bonneville's own research staff is gathering data on railroad electrification, on the application of power in the development of the plastic industry in the region, on electric space heating, on urban and rural power utilization and on other potential uses for Columbia River power.

A program of system development, which was formulated by the Branch of Engineering and Operations, contemplates the early investment of approximately \$164,000,000 in new transmission facilities designed to bring low-cost power from existing and proposed Columbia Basin projects to farms, homes and industry throughout the region. The new facilities will enable the Bonneville Power Administration to bring power into power-deficient areas, and will make Columbia River power available to any point in the Northwest at the Bonneville standard wholesale rate of \$17.50 per kilowatt-year.

This postwar construction program will provide approximately 46 million man-hours of work at the construction sites and a great number of jobs in the manufacture and transportation of the equipment and materials that would be required.

Initially, the function of the Bonneville Power Administration is regional development; its final objectives are social and economic progress. The mechanism by which these ends are to be achieved is the marketing of an inexhaustible natural resource—Columbia River hydroelectric power. Unlike many Federal development agencies whose programs, in varying degrees, have been arrested in the course of the war, the activities of the Bonneville Power Administration have shown marked acceleration, to a large extent due to war necessity.

During the fiscal year 1945, Congress passed the omnibus rivers and harbors bill which authorized the construction of four dams on the Snake River in Idaho and the McNary Dam on the Columbia near Umatilla, Oreg. The Flood Control Act was passed, authorizing appropriations for the development of the Willamette Basin project, including the Detroit, Lookout Point, and Quartz Creek Dams. In both bills Congress authorized the Secretary of the Interior to market surplus electric energy from the proposed projects.

With these projects authorized for early postwar construction, the Bonneville Power Administration began to develop an extensive program of construction and of market development to encourage the utilization of the Pacific Northwest's water resources for the benefit of the region.

Operations during the fiscal year have been eminently successful. In addition to having made a contribution of incalculable value toward winning the war through service to war industries, military establishments and agriculture, the Administration has progressed in its construction and power marketing programs. The financial position of the project is sound and may be expected to remain so despite temporary setbacks that were caused by the changeover from full wartime to partial peacetime activities.

The transmission system that is serving all of the major load centers, particularly those which have been engaged in war goods manufacture, and also much of the outlying region, will be ready for further expansion according to already completed plans as rapidly as manpower and materials become available.

The Southwestern Power Administration

During the past fiscal year the Southwestern Power Administration continued to operate the Grand River Dam project, marketing the power that was generated there, and at the Norfolk and Denison Dam projects, which are operated by the War Department.

The Grand River Dam project, which is owned by the Grand River Dam authority, an agency of the State of Oklahoma, was under Federal control for the duration of the war. The Government completed the transmission system and made contracts to dispose of the power output to war industries, chief among which are Camp Gruber, an Army camp near Muskogee, Okla.; Oklahoma Ordnance Works, near Prior, Okla.; The Cardox Corporation at Claremore, Okla., and the Jones Mills Aluminum Reduction Plant at Lake Catherine, Ark. During the past 2 years, the Southwestern Power Administration has worked to secure desirable industrial loads for the project, which would continue after the war. As a result of this work, service was begun to The B. F. Goodrich Co. plant at Miami, Okla., in December 1944, under a permanent contract.

The Norfolk and Denison Dam projects are each equipped with one 35,000-kilowatt generating unit. They have no transmission systems. It was, therefore, impossible to sell the electric production of these two projects directly to wholesale users. Contracts were negotiated with the neighboring private companies, under which the companies purchased all of the power output for their own use. The private companies in return, have made substantial rate reductions to Government-owned facilities and to other consumers, by specific provision of the contracts. These two projects have been in full commercial operation since March 1945.

The Administrator of the Southwestern Power Administration has made and published a general study covering all of the constructed, authorized and proposed War Department dams in the Southwest. We intend to initiate the program of development during the next fiscal year.

Bureau of Mines

The continuation of the many varied scientific and technologic activities of the Bureau of Mines provided assistance to the producers and manufacturers of war materials and to the armed forces, and also resulted in the addition of a wealth of technical information which is expected to benefit the Nation in the readjustments of the post-war years. These services to industry and to the Nation obviously are worth many times what it cost the Bureau to render them.

Many of the advances made in the laboratories and pilot plants that are operated by the Bureau were achieved under the pressure of a national emergency, but they will help the mineral industries to adjust themselves to a new peacetime economy. This is especially true in the field of mineral exploration and development; that is, in the search for critical and essential ores and in experiments to find the best and quickest methods of converting these ores into usable metals and other mineral commodities. During the war years, the Bureau performed a great deal of this kind of work, because of the need for speedy action to meet changing requirements.

Equally important technological results were obtained in many other widely diversified fields in these years, including research in coal and coal products, explosives, ventilation, petroleum, synthetic fuels from coal and oil shale, air and dust analyses, and fuel efficiency. The Bureau's specialists strove to answer questions that would solve urgent wartime problems, and they answered many of them.

Not all of the Bureau's experiments were successful, but that is not expected in any kind of scientific research, and enough of them yielded results to cause other war agencies to depend more and more on the Bureau in certain fields. Many of the techniques and processes that were developed by the Bureau during the war already have been

adapted by private industry and in Government-operated plants, and others are being considered in long-range post-war planning.

The Bureau's staff also provided valuable aid in consultation with Government and industry in fuel efficiency, in the conservation of manpower through safety training and accident prevention, and in promoting a more efficient utilization of all resources. Furthermore, the factual information that was supplied by the Bureau about the production, distribution, and consumption of scores of mineral commodities was important to the war planning of many agencies and is essential in peacetime to industry. Most of the technical information accumulated by the Bureau in 1939-45 has been compiled and published.

Without waiting until the end of the war, the Bureau of Mines began to plan for the postwar era, with the hope that the Bureau and the Department might be helpful in formulating a future mineral policy for the Nation. I have already discussed our depleted mineral resources, and I have recommended some remedial measures. I here recommend further that we do all that can be done to insure the health and safety of workers in mines and smelters and plants, both to conserve manpower and to make additional reserves available by the removing of hazards. The Bureau of Mines has had more than three decades of experience in this field, and gave the advantage of this to Government and industry during the war. Accident rates declined and the production of coal mounted despite manpower shortages, loss of skilled workers to the armed forces, and the inability to replace worn machinery. Innumerable safety improvements were made as the result of the Bureau's inspection of 3,400 coal mines last year. Thousands were trained in first aid, mine rescue, and accident prevention, and Bureau engineers saved lives by assisting at major mine fires and explosions.

Without a detailed knowledge of the economic conditions in the minerals industries, no program of exploration and investigations could be expected to succeed. I think that the Bureau of Mines should be authorized to expand its economic and statistical services to obtain accurate and up-to-date information on the production, distribution, and consumption of all of our minerals and fuels.

The mineral legislation under which the Bureau of Mines operates now, with one or two exceptions, is permissive in nature. The Bureau in general is an advisory agency, and is in no position to exercise any authority over the use of mineral resources. New legislation designed to cope with postwar problems should be more positive, requiring specific things to be done, and having the effect of defining a national mineral policy. A good example of the type of legislation needed is the Synthetic Liquid Fuels Act, which sets forth a specific 5-year program of research in the production of gasoline and oil from coal and oil

shales, defines clearly what should be accomplished, and appropriates funds for the purpose. Another is the Federal Coal Mine Inspection Act, authorizing the inspection of coal mines in the interest of safety and efficiency.

With its pilot plants and laboratories, its engineers, chemists, metallurgists, geophysicists, and other trained personnel, the Bureau of Mines is ready to put into effect a Nation-wide program of mineral conservation and development which it believes will be in the interest of future security and national welfare. Many of its recommendations have been submitted to Congress, others are in advanced stages of development.

The Geological Survey

Geology is becoming increasingly important to the Nation's social and economic welfare. During the war our geologists located new mineral deposits by applying geologic principles. They also predicted for the military intelligence the terrain conditions in those areas in which combat operations had to be conducted. While their military activity was perhaps the more spectacular and won numerous military commendations for directly assisting the armed forces, the Survey's information about our mineral deposits, and its program of searching for new ones, contributed materially to solving the country's supply problem.

Turning from the past to the future, the Survey recommends a considerably extended program of aerial geological mapping so as to provide the necessary geological basis for sound planning in the development of our resources. The Survey also recommends continuation and extension of the scientific investigations that, during the war, were conducted cooperatively with geologists representing our allies. These international projects not only bring mutual scientific benefits but they can become a strong contributing force towards better international understanding.

During the year the Alaskan Branch continued its investigations of mineral deposits in Alaska, performed geologic services for the War and Navy Departments, and compiled aeronautical pilotage maps and charts for the Army Air Forces. The investigation of mineral deposits contributed to a more adequate inventory of Alaska's mineral resources, particularly in regard to deposits of mineral materials other than the precious metals. The Branch's geologic service to the armed forces was principally in regard to phenomena associated with permanently frozen ground. An understanding of these phenomena is necessary for carrying on construction activities in frozen-ground areas. The compiling of aeronautical pilotage maps was a continuation of the high-priority mapping from aerial photographs that has been carried on for several years by the Alaskan Branch for the Army Air Forces.

The limitations of funds and personnel prevented the undertaking of any activities aimed toward satisfying the many anticipated needs for information regarding Alaska. Plans for fulfilling Geological Survey responsibilities in Alaska have been made, however, and will be put into effect so far as funds and personnel permit as postwar needs become more acute.

In the Annual Report of the Secretary of the Interior for the fiscal year ending June 30, 1938, the percentage of the area of the United States covered by topographic maps was given as 45 after deductions had been made for maps that had become obsolete and inadequate. As the latest report gives the percentage as 47.7, the average annual increment over the 7-year period is approximately 0.4 percent and for the 65-year period of the Survey's activity the average annual increment is 0.74 percent. At these rates from 70 to 130 years may be required to map this country completely. At this critical period in our history when a serious, thoughtful effort should be made to appraise our national economy and plan for the future, the lack of this essential part of the basic knowledge required for intelligent planning is a serious handicap that we should strive to overcome.

The investigations of the quantity and chemical quality of the Nation's water resources have been continued. These investigations, which relate to a varying and recurring resource, yield records that are widely used by administrative officials in planning water projects, in dividing water among users, and in determining and administering water rights. The records are also used by engineers in the design and operation of hydraulic works and other structures affected by water; by financiers in the consideration of investments; and by lawyers and courts in the adjudication of rights and the assessment of benefits and damages. During the war the information has been conspicuously valuable in the placement, design, and operation of military and naval establishments of many kinds, including power and industrial plants, munitions plants, cantonments, airfields, and hospitals, and in developing water supplies for new concentrations of population brought about by war activities. It will be no less useful in the postwar period of adjustment and reconversion to the requirements of the Nation at peace. As the limits of supply are approached, more and better water is always being sought, and investigations of its availability and utility must be continued.

Although hampered by manpower deficiencies in critical positions, in both field and headquarters staffs, the Conservation Branch has maintained a high level of accomplishment in classifying the public-domain lands as to their mineral and water-power potentialities, in supervising the development and production of minerals from leased lands under Departmental supervision, and in rendering consultative

assistance to various Government agencies and to individuals concerned with public-land administration and minerals development.

The land-classification activities required the expeditious handling of more than 13,000 cases, each involving many geologic investigations and determinations by the field and headquarters staffs; the administrative definition of the known geologic structure of seven producing oil or gas fields; the geologic appraisal of 80 unit plans of operation; and numerous special reports to the General Land Office, mostly in aid of a program for the discovery of new oil and gas fields or deposits during the national emergency.

Mineral-lease supervision, involving the work of special study groups, and the regulation of the development and production of coal, oil, gas, sodium, potash, lead, zinc, and many other minerals from public, Indian, and Naval-petroleum-reserve lands, were continued with due regard to those approved conservation principles which have long guided the Survey in its minerals-recovery policy. Known reserves of such minerals on leased lands under supervision are estimated to have a value in place in excess of 2 billion dollars. Production from these reserves amounts to \$150,000,000 annually and is rendering royalty returns in benefit of the public interest amounting to \$12,000,000.

The Solid Fuels Administration for War

Despite numerous difficult wartime obstacles, the coal mining industry has supplied the unprecedented quantities of fuel required by war production plants to equip the armed forces. This the coal-industry accomplished with the smallest labor supply in a half century.

The civilian population, although at times inconvenienced by winter emergencies and frequently having been obliged to burn substitutes, has had sufficient solid fuels to keep healthfully warm, if not always comfortable. The Nation also has had enough fuel to maintain its wartime civilian economy at an extraordinarily high level.

This is an achievement of which the industry, the government and the consumer can be proud, considering the difficulties involved. We solved, by democratic processes, the perplexing problems which our enemies would have sought to solve by despotic procedures. It was the result of careful planning and control by the Solid Fuels Administration for War, of hard work and good management by the miners and operators, and of cooperation by all parties concerned.

During the war the American miners' average output rose to the highest level of all time; higher than that of any other nation. They worked longer hours than the free miners of any industrialized country in the world.

Difficulties encountered in the production of solid fuels lay, primarily,

in the steady loss of mine manpower to the armed services and to other wartime industries. In many instances mine workers were attracted by higher pay and safer, less arduous employment. We cannot, however, overlook the fact that recurrent disputes between labor and management, which plague this industry in peace and war, prevented the production of additional coal. We were able to hasten the restoration of mine output, thus avoiding major impairment of war production, by helping to speed the settlement of disputes and by taking possession of the mines on various occasions.

While we did not lack fuel from underground which was needed to wage this war, the heavy wartime drain accelerated the depletion of reserves of high grade metallurgical coals and other special purpose coals, and brought closer the time when it will be necessary to deal with the problem of their exhaustion.

The most critical period with respect to our supply of solid fuels occurred in the fiscal year just passed. Bituminous-coal requirements soared to an unprecedented 626,000,000 tons during the fuel year which ended on March 31, 1945. Yet the lack of mine manpower and all-too-frequent strikes caused production to fall some 16,000,000 tons under that figure. Furthermore, we were approximately 5,000,000 tons short of the 66,100,000 tons of anthracite necessary to meet our needs.

Since these deficits in bituminous coal were of particular kinds that were essential to the manufacture of steel, chemicals, and other vital war goods, and upon which a large part of the Nation depended for heating fuel, they presented problems of unusual complexity. It was only by exercising the most careful control of distribution of mine output, by requiring industries to use coal out of stockpiles built up to record heights earlier in the war, and by the insistence upon fuel conservation and the acceptance of alternative fuels by industries and householders, that those problems were solved.

The high degree of success with which distribution difficulties were overcome was due, in great part, to the cooperation of producers, wholesalers, dock operators, and retail dealers in carrying out, without recourse to coupon rationing with all of its undesirable aspects, measures for maintaining an equitable sharing of the available solid fuels supply.

Early in the war, the need for careful planning and control of distribution was recognized. Requirements were forecast a year ahead, production was estimated in advance, and basic distribution patterns were established. Industry representatives were consulted extensively in the formulation of programs. Normal distribution channels were disturbed as little as possible. Controls and regulations were kept at a minimum, giving industry the widest possible latitude for exercising judgment. Under such a policy, producers and con-

sumers alike were enabled to act intelligently. Probable difficulties were detected in sufficient time to permit appropriate counter measures to be taken as they arose.

We did everything within our power to help the coal-producing industry to increase its output. This included aid in obtaining the deferment of as many essential workers as possible from military induction and in providing mine operators with machinery, equipment and supplies. We made a vigorous, if unsuccessful, effort to obtain the release of experienced mine workers from military service after the fighting in Europe was ended. I regret that, because of the lack of funds, we were unable to carry on as effective a fuel-conservation program as conditions seemed to require.

It now appears that the job of maintaining an adequate fuel supply during the winter of 1945-46 would require that the Solid Fuels Administration for War retain the right to direct the distribution of solid fuels, and to stimulate the use of alternative fuels wherever the scarce types are not available.

Disruptions in the flow of coal, due to bad weather, strikes, or other causes, may require emergency action from time to time. We face a most difficult task in preparing for such emergencies while at the same time shipping coal to Europe to help prevent chaos and anarchy from sweeping the liberated nations because of the lack of fuel.

The General Land Office

The public land is an asset which must be taken into account in any evaluation of the natural resources of the United States. This 778-million acre domain belonging to the people is conservatively estimated as representing nearly a quarter-billion dollars' worth of real estate which is under the administration of the General Land Office. While it is obvious that no man can compute with unalterable accuracy the permanent value of land, it is believed that this vast expanse of public domain in the United States and Alaska comprises real estate values aggregating \$235,000,000 of which \$125,000,000 are located in the United States itself. Roughly divided, the assets comprise forest lands and woodlands worth \$160,000,000, grazing lands (outside of districts administered under the Taylor Grazing Act) whose value is placed at \$30,000,000, and other lands, including barren areas as well as those devoted to special uses, valued at \$45,000,000. In addition to this conservative evaluation of the land, technical services rendered to the public and to agencies of both Federal and state governments by the General Land Office constitute other less tangible factors whose values are estimated to bring the total worth of the people's assets in this real estate to \$250,000,000.

The continued management of this property under progressive

conservation policies for use and development with an eye to the requirements of the future, is essential, since in no other way can the domestic demands for maximum beneficial use of the land and its resources adequately be met in the reconversion period.

Already, the trend of scientific research has pointed the way to new fields of usefulness for the public domain, broadening the scope of activities in the development of resources beneath the surface and increasing the opportunities for utilization of the land itself. The wider horizons for mineral uses revealed by the discovery and development of atomic energy, the steadily mounting requirements for lumber and other forest products to repair the ravages of war, and the growing demands for ex-servicemen for land settlement opportunities, serve to illustrate the trend toward more extensive usage in the year immediately ahead.

Obviously, this contribution to future economic advancement will enhance the value to the American people of their public domain. However, it will also bring a corresponding increase in the responsibilities facing the General Land Office. New methods and new laws must be provided with which to carry out these new tasks which, in effect, mark the beginning of a new era in national land administration.

Land administration experiences in connection with the prosecution of the war have sharply accentuated the pattern for efficient management of the public domain in time of peace. At the close of the 1945 fiscal year, definite alterations in Federal law and in procedures of the General Land Office were revealed as imperatively needed to bring about the type of management to which the public is entitled and without which the maximum beneficial use of the national lands and their resources, cannot be assured. Some of these needs long have been recognized, but their enactment was held in abeyance for the duration of the war: Today, freed from the restrictions of military necessity, problems awaiting solution include the rejuvenation of our Federal mining laws and the enactment of a general mineral leasing statute. A thoroughgoing examination of the remaining vacant public land to determine its availability for homesteading use also should be undertaken to meet to some extent the needs of returned veterans for land settlement opportunities in the United States and Alaska. Other factors equally essential to the successful administration of a well-rounded and integrated national land use program are set forth in the detailed report of the General Land Office.

Meantime, it is noteworthy that this official real estate agent of Federal Government closed its books for the 1945 fiscal year with a net profit both in conservation advancement and in financial gains resulting from its work. Operating through four branches with 12 divisions in Washington, 5 agencies in the field with 25 offices scat-

tered throughout the West and in Alaska, and 25 district land offices also strategically located for service in the West and in the Territory, the activities of the General Land Office produce cash returns several times greater than the expenditure incident to its maintenance. In 1945, these cash receipts totalled \$13,381,654 and represented a ratio of \$5.66 for every \$1 of the expenditures, which aggregated \$2,365,005. This was the second consecutive year in which the receipts exceeded \$13,000,000, and the fourth time that receipts of the General Land Office have exceeded \$10,000,000 since 1880.

Aside from these financial accomplishments, definite progress was made during the year in the conservation of natural resources on the public lands. Foremost among its obligations in this field is the establishment of sustained-yield forest management on all of the Federal lands under its jurisdiction, as required by congressional mandate enacted during the 1945 fiscal year. Under this program, forestry operations on the timbered public domain eventually will be brought into a balanced ratio in which the volume of tree-cutting and tree-growing will be regulated so as to provide a continuing supply of timber.

Definite contributions to the Nation's lumber needs were made during the year from the 2½ million acres of revested Oregon and California railroad grant lands in western Oregon under the administration of the General Land Office, operating through its Oregon and California Revested Lands Administration in Portland, Ore. In 1945, sales of timber from these lands exceeded 426,000,000 board feet valued at approximately \$1,518,000. Meanwhile, definite plans for cooperation with private management in the maintenance of sustained-yield forest practices on intermingled public and privately owned lands were advanced during the year.

Prospects of postwar development of Alaska which will increase the burdens of the Alaskan Fire Control Service in the prevention and suppression of fires on more than 250,000,000 acres of public domain in the Territory, confronted this branch of the General Land Office at the end of the 1945 fiscal year. The end of the war is expected to bring about an unprecedented number of tourists and settlers, the reopening of mining operations, and the construction of new airfields and roads, all of which will present new and greater fire hazards.

Favorable weather conditions in 1945 resulted in the smallest fire loss in the 6-year history of the organization. During the year the service took action on 57 fires with a total burned area of 2,535 acres, of which 624 acres were on private land. There were 13 fires inaccessible to the Service which burned over an estimated 110,200 acres. The number of fires for the year, therefore, totaled 70 with an aggregate loss of 112,735 acres. Service records show that more fires were caused by lightning in 1945 than in former years, about 37

percent of the total number of fires being started by lightning, and approximately 98 percent of the total acreage consumed being due to lightning fires.

In the 1945 fiscal year, the use of more than 12,400,000 acres of public land in the United States and Alaska for the grazing of livestock was supervised by the General Land Office as part of its administration of the people's real-estate assets. Consisting of tracts in Alaska that are suitable for grazing purposes and of similar areas in the United States that are not included in the established Federal grazing districts, a total of 12,479,270 acres was made subject to use under 10,593 leases involving annual rental of \$229,523.

The Office of Land Utilization

Experience in the Department of the Interior during the past several years has clearly demonstrated the value of effective coordination and close cooperation in the field of land and resource management. The Office of Land Utilization, which is charged with the responsibility of coordinating and integrating the land-use and land-management activities of the several bureaus and agencies of the Department, continued its policy of promoting unified action through cooperative efforts, the dissemination of information, and the rendering of efficient advisory service.

The methods pursued have proved to be successful and have operated definitely in the public interest. It seems clear that the time has arrived when the principles of coordination and cooperation should be extended to all agencies that operate in the conservation field. The effective use and development of the basic wealth of the Nation—its soils and waters, its forest and pasture lands—will not be at its best until all interests involved have fully coordinated their responsibilities and activities.

The Grazing Service

On the whole the surface resources of the Federal range in grazing districts are in as good condition as they were in at the beginning of the war, or in better condition. Even so, the range made an effective contribution to the Nation's needs for war. This is in sharp contrast to the situation of the First World War when increased numbers of livestock on the open public domain, then unregulated, stripped the forage and hastened its depletion without adding materially to food supplies during that conflict. The range livestock industry itself, aided by stabilized range use fostered by the Taylor Grazing Act, is now in a strong position to cope with the problems of postwar readjustment.

The use of 14½ million acres of Federal range as testing grounds for machines and training grounds for men emphasized the importance of

these lands as a key to successful global warfare. While it was necessary to exclude livestock from certain military training areas and testing areas such as the one used in the atomic bomb experiment in New Mexico, it was possible through special arrangements with the military authorities to provide alternate grazing during the war period for nearly 500,000 sheep and 16,000 cattle on areas set aside for war purposes.

Livestock production levels of the earlier war period were maintained and in some localities exceeded during the year ending June 30, 1945, although slightly fewer animals were permitted on the range than in the previous year. Total numbers licensed to use the range declined 6 percent from 10,694,305 to 10,019,178, a reduction of 675,127 head. There were 725,464 fewer sheep but 86,174 more cattle. The number of authorized users decreased by 912 from 22,562 to 21,650. Big game increased from 535,000 head to 583,000.

On the basis of natural wealth and long-time economic values, the surface resources and facilities of the Federal Range, administered by the Grazing Service, have an assumed capital value of not less than one-half billion dollars. Although the principal use made of range land is the grazing of livestock and the providing of food and shelter for big game, these purposes are closely related to those of other resources among which are the soil, water, wood, and crop lands, and recreational areas. The administration of these land aims, in addition to stabilizing the dependent livestock industry, to accomplish the conservation and proper use of all of the resources upon them. Progress toward these objectives by the Grazing Service, although interrupted by high priority war needs, was in general satisfactory during the fiscal year just closed.

The Fish and Wildlife Service

If all of the economic and game animal resources were to vanish from this continent tomorrow, the United States could reckon this catastrophic loss at something over a hundred and forty billion dollars. This is the value which the Fish and Wildlife Service places on the birds, mammals, and fishes which inhabit the Nation. The abundance of these resources is in a state of continual change. Against the many forces acting to reduce it—such as excessive exploitation, pollution, diversion of water for industrial uses, etc., the Fish and Wildlife Service is acting in various ways to increase it. This service to the Nation is evaluated as being worth approximately 30 million dollars a year.

The war has had little, if any, effect upon the abundance of our continental fish and wildlife resources. If anything, it was beneficial to it, since hunting and fishing were generally below peacetime levels.

However, certain of the commercial fisheries increased the intensity of their operations in response to augmented demands for protein food, and imposed added strains on the stocks of those species which they exploit. Hence the problems of restoring stocks that have declined in quantity will be one of the most important post-war activities of the Fish and Wildlife Service.

From the standpoint of conserving fish and wildlife, a problem of primary importance has been created by the increasing uses of water for public purposes. However, the disposal of sewage and industrial waste products, is an obnoxious nuisance. As a result of the researches of Fish and Wildlife scientists, pollution is becoming less excusable each year. This is because the Service is constantly improving and enlarging the criteria of acceptable water quality, and is constantly striving to develop methods of utilizing waste. Largely as a result of these efforts, domestic sewage and almost every kind of industrial waste can now be disposed of by practical and commercially profitable means. Thus, conservationists have an unassailable position in answering any assertion that it is too costly or impractical to avoid defiling our streams. Indeed, many industrial enterprises in the fields of distillation, brewing, canning, petroleum refining and electroplating have not only been able to eliminate waste, but to do so at profits greater than those derived from some of their basic products. Thus it looks more hopeful than ever that pollution will gradually become a less menacing evil as our fight against it progresses.

Meanwhile the accelerating trend to modify water courses for power, irrigation, and flood-control projects, is a serious threat to the resident animal life. A dam can change a stream enough to exterminate the most valuable fish and wildlife resources dependent on it. Yet it is possible to devise means of modifying that dam so as to preserve those resources. That is what the Fish and Wildlife Service is endeavoring to do wherever major water utilization projects are under construction or are being planned. There are few if any precedents or principles to guide in this work. For the most part each dam presents an entirely new set of conservation problems which must be solved before construction, and tested afterwards with results that may not become evident for several years. During 1944, an experiment designed to preserve the salmon of the Columbia River, which were stopped in their upstream migration by the unsurmountable Grand Coulee Dam, was tried for the first time. This involved trapping the fish and hauling them overland by truck to the tributaries below the dam. The remarkably successful results give hope that the problems of preserving the animal stocks in the numerous other places where dams are projected, will be as successfully solved through the intensive study that the Fish and Wildlife Service is carrying on.

The encroachments of civilization upon primeval habitats has emphasized the importance of refuge areas as the most effective device for conserving wildlife. During 1944, six large areas were added to the national system, which now furnishes protection to about 25 percent of the waterfowl resources.

The Office of the Coordinator of Fisheries

The year 1945 brought the completion of the principal task which had been assigned to the Office of the Coordinator of Fisheries upon its creation early in the war. This was to restore and maintain the ability of the fishing industry to produce the protein foods, vitamin oils, animal feeds, and industrial oils which were needed in exceptional quantities for war purposes. The productive capacity of the industry has been shattered by the events of the first months of war. The requisitioning of boats, the drafting of skilled fisherman, the heavy needs of the military services for netting, cordage, marine engines, and most of the other essentials of fishery production, all made the problem of meeting the heavy war demand for fishery products an especially difficult one.

From its normal level of about 4.4 billion pounds, the yield of aquatic products declined in 1942 by half a billion pounds. Beginning in 1943, however, production made steady and gratifying increases, actually exceeding the peacetime yield in 1944 and continuing to gain in 1945.

This steadily increasing production was achieved principally by restoring the numerical strength and effective functioning of the fishing fleet. Specifically, it was brought about by the construction of new fishing craft, the provision of facilities for repair, and the supplying of nets, cordage, and other equipment that was necessary to production.

During the period from May 13, 1943, to June 30, 1945 the Coordinator's Office authorized the construction of 2,002 new fishing vessels and recommended the approval by the War Production Board of applications for controlled materials and products worth \$9,053,605. In addition to acting as claimant for the fishing industry before other Government agencies, the Coordinator's Office administered production programs controlling fisheries which collectively yield about one-third of the total United States production—those for the Pacific sardine or pilchard and for the salmon of Alaska and Puget Sound. Under these programs, the available manpower and equipment were used far more effectively than would have been possible otherwise, and the yield of these important fisheries was maintained at a satisfactory level in relation to the stocks of fish.

In carrying out its wartime task of supplying the aquatic products that were needed for war, the Coordinator's Office has also worked

to safeguard the fishery resources from excessive drains which would impair their future value to the Nation. In contrast to the situation at the end of World War I, the fisheries as a whole have been maintained in sound condition.

The National Park Service

The National Park Service, although operating throughout the war with greatly reduced personnel in the field and at its headquarters, experienced a steady increase in travel to the 169 areas that it administers. This increase became more rapid with the end of the war in Europe; next it became a flood. Not only did this suddenly increased use of the National Park System place a heavy strain on the organization of the National Park Service and of the companies operating concessions; it also forecast a volume of travel during the next season which may well surpass the record year of 1941.

This prospect points to the necessity of bringing the Service's organization back to approximately its prewar size and functions. This will be impossible without funds to supplement those now available, since the present appropriation was determined in the expectation that the war with Japan would continue for another year at least, and that the wartime low volume of travel would continue.

The National Park System has been weathering the war period without material damage to the resources of scenery and history and science which it is charged with conserving. Perhaps the most serious threats to such resources were found in the efforts to open parts of Olympic National Park to the logging of Sitka spruce and of Great Smoky Mountains National Park to the cutting of its virgin stand of red spruce. Proposed legislation, which would have compelled the opening of all national parks to the grazing of domestic livestock, aroused such widespread opposition that no action was taken on it in the Seventy-eighth Congress, neither was it introduced in the Seventy-ninth.

Although the work of the National Park Service was not considered to be tied in directly with the prosecution of the war, the areas that it administers provided much-sought recreational opportunities for members of the armed forces and those engaged in war industry, and it is also fair to say that the system through war permits made its appropriate contribution to the victory.

Immediately ahead of the National Park Service, as soon as funds can be made available for it, is a program of reconditioning of roads and trails and of the utilities and facilities that are used for administration and for direct service to the public. For this it is estimated that \$1,200,000 will be required during the next year or two. Along with that should go an orderly program of needed developments.

All construction has been halted for 4 years. A program should be started for the acquisition of non-Federal lands within the boundaries of areas in the park system. These holdings, amounting to more than 600,000 acres, make it difficult to furnish adequate protection to Federal properties, add to the expense of providing needed developments, and are open to undesirable and destructive uses.

The controversy over the establishment of Jackson Hole National Monument was marked by two important events: The late President Roosevelt's veto of the Barrett bill, which would have abolished the monument, and District Judge Kennedy's decision, in the Case of the *State of Wyoming v. Paul Franke*, affirming the legality of the President's action in establishing the monument. Representative Barrett has reintroduced his bill and Senator Robertson has introduced a bill to amend the Antiquities Act of 1906 by providing that the establishment of a national monument would require approval by the Governors and a majority of the congressional delegations of the states affected. No action has yet been taken on either of these nor on any of the four other bills now pending which would amend or abolish the Antiquities Act. I continue to believe that it is still true that only vision and perspective can be relied upon to save for Americans of future generations outstanding areas that belong to the whole people.

The cooperative responsibilities of the National Park Service have been appreciably enlarged through the first appropriation to implement the Park, Parkway, and Recreational Area Study Act of 1936; by studies, undertaken at the request of the Corps of Engineers, of the recreational values of reservoirs proposed to be built by them; and by a study, launched at the request of the Bureau of Reclamation, of the same sort with respect to their prospective reservoirs in the Missouri Basin. By agreement with the Bureau of Reclamation, the Service is also undertaking the administration of the recreational resources of the Friant and Shasta Dams in the Central Valley project in California.

The Office of Indian Affairs

The Office of Indian Affairs reports some important gains during the past fiscal year.

The program of land acquisition and consolidation has been continued; 257,000 acres, formerly opened for settlement but unclaimed, were restored to Indian use. Tribal funds, totaling \$177,000, were used in purchasing 63,000 acres on 12 reservations, much of this land being from Indian estates complicated by heirship. The Jicarilla Apaches newly completed their program of consolidation, and the Southern Utes reacquired 40,000 acres at a cost of \$83,000. The

Rosebud and Cheyenne River reservations have made notable progress in the exchange of heirship interests for use-rights in tribal lands, thus enabling many Indians to engage in, or enlarge, farming and livestock operations.

Recent experience has demonstrated the facility with which the resources on Indian lands could be developed for the national benefit. Thus far during the war, 11,400 oil wells on Indian lands produced more than 70,000,000 barrels of oil, principally in Oklahoma, Montana, and Wyoming. During the past fiscal year Indian wells yielded 23,000,000 barrels of oil. The excess draft on this nonrenewable resource, however, was not too heavy, and conservation practices continued to be applied in the Osage field. The yield of the Cutbank field on the Blackfeet Reservation began to decline in 1945.

War bonuses made possible the extraction of some low-grade lead and zinc ores from the Quapaw lands, which yielded 78,248 tons of zinc and lead concentrates during the past year. The total production during the war years was 415,000 tons valued at \$38,000,000.

More than half a billion feet of timber were cut and removed from Indian forests, the major portion being for military use. Indian saw-mill enterprises produced more than 30,000,000 feet of lumber, but the principle of sustained yield was maintained.

Maximum production was maintained on 44,000,000 acres of forest and open range land, and overstocking generally was not permitted, although overgrazing still presents a difficult problem on the Navajo, Hopi, and Papago reservations.

In the calendar year 1944, the Indians earned a total income of more than \$15,000,000 from their beef and dairy herds—an increase of more than \$1,000,000 over the previous year. In addition, the livestock and livestock products consumed at home had a market value of more than \$7,000,000.

Although about 45,000 Indians left their homes during the year to work in various industries, while 25,000 others were serving in the armed forces, those who remained at home produced nearly 5,000,000 bushels of cereal crops valued at \$5,000,000. Other field crops with a market value of \$3,500,000 were produced, while tree fruits, nuts, and berries, sold and consumed, were worth \$775,000. Garden produce, raised by 32,000 families, was valued at more than \$1,000,000.

Indians not only increased food production at home, but further contributed to victory by working for the Red Cross and by assisting in the war-loan drives. Many communities, in which income are small in terms of cash, made large contributions to the Red Cross, and war-bond quotas were frequently over-subscribed.

Indians in the armed services won high praise for their conspicuous gallantry on all fronts. The Office of Indian Affairs has recorded two awards of the Congressional Medal of Honor, 51 of the Silver Star,

70 of the Air Medal, 34 of the Distinguished Flying Cross, and 50 of the Bronze Star.

In April 1945, more than 400 Aleuts who had been evacuated to the mainland at the time of the Japanese invasion of the Aleutians returned to their island homes. The Army and the Navy, with the help of Indian Service architects, will rebuild their villages; and Indian Service teachers and special assistants are helping the natives to reestablish themselves.

Because of the great exodus of Indians from the reservations, the attendance at Indian schools has decreased considerably, and many children who left home with their parents have been deprived of schooling. Much of this loss of education may be irreparable, but a new emphasis is now placed on the value of education by those who are returning from the armed services. During the year the Navajos demanded by resolution that the Government keep its pledge of 1868 to furnish a schoolroom for each 30 pupils. There are nearly 20,000 Navajo children of school age, but the school facilities will accommodate no more than 40 percent of them.

Because of the shortage of personnel, the health service was compelled to limit its activities largely to curative and palliative measures. During the past year, 750,000 out-patient treatments were given, and 40,000 patients were placed in hospitals with a total of 865,000 in-patient days.

During the year a judgment was entered in the United States Court of Claims, allowing the California Indians to recover \$5,024,842.34 in partial satisfaction of claims arising from the Senate's failure in 1852 to ratify 18 treaties made with these tribes.

The Menominee swamp land case was settled by the payment of \$1,590,854.50 from funds of the Menominee Tribe to the State of Wisconsin for 33,870 acres of swamp lands within the boundaries of the Menominee Reservation.

Reexamination of claims for losses of personal property by the Sioux Indians after the "Custer War" resulted in a departmental finding that the claimants were entitled to the additional sum of \$101,630.

Although the Colorado River Reservation was set aside in 1865 for the Indians of the river and its tributaries, colonization of the area was not feasible until, at the outbreak of the war, the completion of the Headgate Rock Dam and its distribution system made possible the irrigation of 100,000 acres of land. In May 1945, the War Relocation Authority returned to the control of the Indian Service 2,000 acres of developed land in the southern area, and 16 Hopi families decided to migrate to the reservation, taking over 40-acre units of irrigated land.

The Division of Territories and Island Possessions

The territorial areas—Alaska, Hawaii, Puerto Rico, and the Virgin Islands—have been the active, strategic outposts of the American people at war. In the interest of the Nation at large, most of them have endured perils, hardships and losses exceeding anything experienced in the continental United States.

All of these areas are trying to establish a more workable formula for their political relationship with the continental United States. Alaska and Hawaii have both had Statehood bills introduced into the Congress, and Puerto Rico has drafted and had introduced a bill which requests the Congress to authorize the people of the island to decide by a plebiscite whether they shall have independence, statehood or a dominion type of government. The Virgin Islanders are preparing amendments to submit to the Congress which would liberalize their organic act.

We should support these 2½ million American citizens who are trying to evolve a sounder relationship with us and who are, in effect, giving us the opportunity to maintain our leadership as a progressive nation. As you stated recently of the Puerto Ricans: "All Americans are grateful to them for their loyalty and service during the war * * * such loyalty should now be rewarded by the opportunity to reinforce their local government and to settle by free choice their future relationships with the United States."

In addition to support from the mainland in the fulfilment of their political aspirations, it is obvious that the territorial areas will deserve our full cooperation in the restoration of their normal economic life.

In Hawaii, agricultural production was hindered from the beginning of the war by acute shortages of labor and equipment. The flourishing fishing industry was practically suspended, and the great influx of troops and war workers caused a crisis in housing and public health.

Puerto Rico and the Virgin Islands, when shipping had been drastically cut, came very close to mass hunger. Shortages of food and essential consumer goods were critical during the early years of the war in both Puerto Rico and the Virgin Islands; and throughout the war their own agriculture and industry have been seriously handicapped by the lack of equipment, supplies and shipping.

The Philippine Commonwealth suffered great physical damage and severe dislocation of its industry and trade. At the end of the Japanese occupation, it was found that sugar cane production in the islands had been disastrously reduced; many sugar mills had been destroyed; and a violent inflation had set in, originating from the flood of Japanese pesos, and intensified by the dire scarcity of essential goods.

In seeking remedies for their wartime losses and dislocations, the governments and people of these American outposts have proceeded

along practical lines. They have shown a readiness to rely to the fullest extent possible on local resources, local devices and local ability. Indeed, one of the significant features of our relations with the territorial areas is the energetic attention given to concrete economic and governmental problems, while at the same time we have engaged in the formulation of a policy looking toward a sound and realistic political relationship.

This direct approach to common problems is characteristic of the close working relationship which the Division of Territories and Island Possessions has helped to develop between the local governments and the mainland. Such activities as those of the Territorial Office of Civilian Defense in Hawaii and the Civilian Food Reserve program in Puerto Rico have strengthened these working relationships during the war. Some of these ties will be broken when the special war services are discontinued. To the normal peacetime problems of economic and governmental development will be added those of recovery from the special losses and dislocations of the war. In dealing with these problems, care must be taken to preserve mutual confidence in inter-governmental cooperation.

The Territory of Alaska, which attracts increasing attention from prospective agricultural settlers, traders, and tourists, will need further assistance in such matters as road surveys, soil management, breeding and feeding of fur animals, experimental fishing, water resources investigations, mineral surveys, topographical mapping, land classification and development of recreational resources. Only by securing such assistance, can the Territory, as well as the 48 States, derive the full benefit from the transfer of population which is likely to occur.

In Hawaii, the problems of housing and public health, which are now extremely critical, will need continued attention for some time after the war. There may be a partial reversal of the wartime influx of workers from the mainland; but, in any case, as a result of the severe impact of the war upon Hawaii's economy, the readjustment of industry and agriculture and the rehabilitation, of returning servicemen and local labor, will present problems calling for real intelligence.

The insular government of Puerto Rico has gone far by its own efforts to encourage the maximum development of resources, to attract suitable industries, to improve labor-employer relations, and to develop sanitation.

In the Virgin Islands, progress is being made toward increased responsibility in the management of local affairs and toward greater economic productivity. But the postwar period will bring difficult problems of readjustment which will be only partially solved by the proposed Federal program for construction of public works, such as health and sanitation facilities. A more complete and explicit policy

is needed with respect to political status and economic development.

In the Philippines, the biggest immediate jobs are the reconstruction of industry, particularly the production of sugar, and the reestablishment of the Commonwealth finances on a sound basis. Difficult questions of war damage compensation and future trade policy will call for close and farsighted cooperation of the two governments.

In every territory certain economic problems will remain for solution, no matter what form of political status may be adopted. It will be fortunate if, as discussions of "statehood," "independence," and "dominion status" proceed, leaders of opinion, in the territories and on the mainland, will continue to give attention to the common economic problems that lie before them.

The War Relocation Authority

The War Relocation Authority, created as an independent agency in the spring of 1942 and brought under the Department of the Interior in February 1944 had, at the close of this fiscal year, assisted in the permanent relocation of 51,412 persons of Japanese ancestry, from the 10 relocation centers which it originally administered.

The original population of these centers was approximately 110,000. The Tule Lake relocation center became a segregation center in the summer of 1943, as a result of the progress of relocation at that time.

The chief objective of the Authority has been to return to the main stream of American life all of those evacuees from the west coast who have not been denied the right to return by the Department of Justice or by the War Department. Most of these latter are among the 17,454 persons remaining at the Tule Lake Center.

The relocation of eligible evacuees was greatly speeded when the Western Defense Command on December 17, 1944, announced that it would rescind its evacuation order on January 2, 1945. On the day following the announcement, December 18, the Director of the Authority announced that the remaining eight relocation centers would be closed in not less than 6 months nor more than 1 year.

The success of the relocation effort is indicated by the fact that during the year 24,679 evacuees did establish themselves outside of centers. And while the movement back to the west coast was slow immediately after the lifting of the ban, by the end of June, 4,922 individuals had resumed residence in the evacuated zone. In this same period, however, 10,176 persons had relocated in other parts of the United States.

Obstacles to a stronger movement back to the coast were met with an energetic program of assistance, and of authentic information to create a more ready acceptance of the returning evacuees. Prejudice was strong in some areas of the west coast, where acts of attempted violence against evacuees were committed, such as shooting at their

homes and planting dynamite. In other instances acts of intimidation were committed. Other serious handicaps were the acute housing shortage and the comparatively large number of evacuees who were in need of public assistance. Farmers among the evacuees also found it difficult to get the necessary equipment to operate their lands.

The well-publicized military record of the more than 20,000 young Nisei men who volunteered for, or were called into the Army after the reinstitution of Selective Service for them, on January 20, 1944, did much to overcome prejudice on the west coast, as did the fact that many of the relocating evacuees went directly or indirectly into war work. Large groups of both citizens and aliens took employment with the Army Ordnance Depots at Tooele, Utah, and Sidney, Nebr.

To overcome the housing difficulty, full time housing experts were attached to various area offices and field offices on the coast, and independent cooperating groups sponsored hostels in key localities in which evacuees could live while finding permanent quarters.

The Authority, in its budget requests, based its needs on an estimated population at its centers of approximately 44,000 by the beginning of the 1946 fiscal year, and as the 1945 fiscal year closed, the population figures were actually close to this total.

Population charts for the centers revealed that a great majority of those who were relocated came from the age group between 18 and 35, leaving the residue of children and older aliens, posing a greater problem in working out relocation plans. Many of the more difficult relocation problems were being solved through the cooperation of Federal, State, and county welfare agencies.

Relocation was materially speeded by the elimination or curtailment of many of the center functions. These included the closing of the schools with the end of the June term, the termination of the agricultural and construction programs, with certain exceptions, and the reduction of maintenance. Mess halls were closed whenever a block population dropped to 125 or fewer. Other functions were greatly restricted as the relocation of persons who were able to work reduced evacuee manpower to a minimum.

By the end of the year a pronounced reluctance on the part of a considerable number of evacuees to leave the centers was being gradually overcome, as they realized that the final closing of the centers was a fixed policy.

The War Relocation Authority completed its first full year of operation of the refugee shelter at Fort Ontario, N. Y., having taken over this responsibility in July of 1944, when approximately 1,000 refugees from Europe arrived there. Problems here were somewhat different from those of the relocation centers. In June the subcommittee of the House Committee on Immigration and Naturalization held a hearing at the shelter to determine the possibility and

advisability of extending immigration status to the residents of the shelter, but had not made its findings public as the fiscal year closed. Fourteen of the refugees returned to Europe during the year and another group was preparing to return in August.

The Office of the Solicitor

The Office of the Solicitor, while continuing to carry its regular load of normal departmental legal work and the extra burdens imposed by war activities in fuel, mineral, territorial and other fields, was able to absorb a new and increasingly heavy and important additional legal responsibility in connection with the departmental and general governmental programs incident to peacetime reconversion.

Most of the proposed reconversion programs under consideration by the Congress are closely interwoven with the regular activities of the Interior Department. For example, the regional authority bills, the bills for the disposal of surplus property, the strategic materials stock-piling bill, and the several bills for scientific research and development. The Department's attorneys examined and analyzed all of the reconversion bills, and all others affecting the Department's activities, prepared committee reports, suggested clarifying amendments, arranged for attendance and testimony of Departmental witnesses before Committees of Congress, and generally advised the interested agencies of the Department with respect to the legal significance of proposed legislation as it might affect their particular activities and existing authorizations.

Documents were drafted incident to the seizure and possession of struck coal mines under various executive orders; plans were developed for the orderly return of eligible relocation center residents to normal communities and for the prompt liquidation of war relocation centers. Bureau of Reclamation attorneys prepared 37 basin reports, to be submitted to Congress, providing for comprehensive postwar plans for the development of water, land and hydroelectric power resources, and they were actively engaged in the legal implementation of the Bureau's vast reclamation programs which had been temporarily halted by War Production Board orders during the war. An important victory was won in the case of *United States v. General Petroleum Corporation, et al*, involving additional oil royalties to the United States in the Kettleman Hills district, California. Regulations were drafted with respect to such matters as grazing under the Taylor Grazing Act; to provide for the reopening of the national parks on a peacetime scale; to anticipate an expected increase in hunting during the 1945-46 season; to relax wartime control of explosives; to improve the control over departmental patents, and many others. Hearings were conducted in Alaska with respect to Indian aboriginal rights

and conferences with territorial and War Department officials culminated in the terminating of martial law in Hawaii. This, briefly, is indicative of the range and variation of the legal affairs that were dealt with through the Solicitor's office.

Conclusion

The foregoing pages provide a documented basis for a truth that can be summed up in a fairly brief sentence: We lack much that we need, and we must get it or else suffer grave consequences in the not very remote future.

If anything remains to be said it is only enough to stress what "we" means, and to point out what the kind of suffering that I have referred to could mean to each one of us.

"We" does not mean the Nation in any life which it may be supposed to live apart from the people themselves. "We" means all of us, and here, if not in Webster, it means each of us. It means we who are free, but who would not be if we were conquered. It means we who have and use a thousand conveniences that are made of metals, but who would not have them if we exhausted our mineral supply.

If we suffered the worst that could befall us, under attack, for a lack of metals we would not merely suffer "an unsuccessful war," nor would we do our suffering academically on a certain page of a school history. We would suffer goosestepping, and we would suffer it in our homes, and in our schools, and in our places of business.

If our shortages of metals were acute enough, even in time of peace, we would not suffer merely from "reduced inventories," or from "a higher cost-of-living index." We would suffer from our inability to get automobiles, refrigerators, washing machines, and other luxuries that have become common place to us, because, in their scarcity, they would be available only at outrageous prices which we could not pay.

All that I can set down by way of a formal conclusion is that the situation with respect to many of the minerals upon which our very manner of living depends is such as to give the United States of America real national concern. If we do not remedy that situation we will most certainly and indisputably wish that we had.

Sincerely yours,

A handwritten signature in cursive script, reading "Harold L. Ickes". The signature is written in dark ink and is positioned above a horizontal line.

Secretary of the Interior.

The Bureau of Reclamation

HARRY W. BASHORE, *Commissioner*

THE Bureau of Reclamation during the fiscal year maintained at record levels its production of food and power for a fighting Nation, and carried forward its plans for further development of Western resources in meeting the problems of peace.

Food production on Federal Reclamation projects during the war years has been stepped up to the highest levels in history. In 1944 the gross value of food and fiber crops reached an all-time peak.

Power plants operated by the Bureau at its great dams in the West have been a major factor in the rapid expansion of war industries in Western States, and the power output of these plants during the past year totaled almost 14 billion kilowatts, most of which went into production of planes, tanks, ships, and other commodities to sustain our fighting forces in all parts of the world.

While directing major attention to its programs in support of the war effort, the Bureau during the year has also made substantial progress on its plans for undertaking a greatly expanded program for development of Western resources during the postwar period. With the end of hostilities the Nation faces not only the problems of the immediate reconversion period, but also the longer range problem of maintaining a high employment and high production economy at a permanent level. The postwar program of the Bureau of Reclamation is designed to gear into both the reconversion period and the leveling-off period which follows it.

That program, outlined before a congressional committee in April, calls for full development of the agricultural and industrial resources of 17 Western States through construction of multiple-purpose projects to provide irrigation, power production, flood control, and other benefits. The Bureau's postwar inventory of projects listed 415 proposed for construction after the war, including those on which work is under way or authorized and those on which studies are still being made. Construction of these projects, estimated to cost nearly 5 billion dollars at 1940 price levels, would provide thousands of jobs, open new lands for settlement by veterans and others, stimulate the development of new industry, and in many other ways help meet

the problems of reconversion and in permanently building for a better stronger America.

The late President Roosevelt, in a letter written a few days before his death to Representative John R. Murdock, chairman of the House Committee on Irrigation and Reclamation, emphasized the importance of Reclamation projects as a means of providing job and farm opportunities for returning veterans. An excerpt from that letter, dated April 10, 1945, is as follows:

As I stated in my message to the Congress of January 13, 1944, demobilization starts long before the war ends, and it is essential that programs of assistance to veterans be authorized and adequately prepared now. One such program has been under active study and is in the advanced stages of planning through the work of the Bureau of Reclamation, Department of the Interior. I have frequently spoken with pride of the accomplishments of this administration in water Reclamation projects. The great Columbia Basin project in the Northwest, the projects in the Missouri River Basin, and others of equal significance, as I said at Chicago on October 28, 1944, are golden opportunities for returning veterans. Such projects constitute great increases in national wealth and income. They also offer splendid opportunities for secure and abundant livelihood to men and women willing to engage in the arduous, though stimulating, task of pioneering these latest frontiers. I commend and urge your favorable consideration of Federal Reclamation projects as an important opportunity for returning veterans.

A program to facilitate settlement of returning veterans on farms can be of great value in assisting them in returning to civilian life. It can also be of great value in the reconversion of our national economy to fully prosperous peacetime basis. Full enjoyment of the great productive resources of this Nation by all of the people requires that all have opportunity to engage in productive labor. The purchasing power created by reclamation projects is a stimulus to industry and commerce, thus promoting full employment throughout the Nation. Those engaged in agricultural production should secure ample livelihood so that they can participate in enjoyment of the products created by full industrial employment. Measures in addition to those dealing with Federal Reclamation projects will be needed to round out a comprehensive program in this regard.

Projects included in the Bureau's inventory are integral parts of programs for coordinated resource development on a basin-wide scale in each of 15 major river valleys in the West. The first of these comprehensive studies and reports was completed during the fiscal year 1944 for the Missouri River Basin, and the Congress approved the joint plan of the Bureau and the Corps of Engineers by passage of the Flood Control Act of 1944. The postwar inventory includes 29 Bureau projects initially authorized for construction in carrying out this coordinated plan.

Production of food and power on 52 operating projects of the Bureau during the year was maintained at record levels, as was generation of power for war production.

Construction activities of the Bureau were continued during the year on a restricted basis, confined mostly to war food and war power projects approved by the War Production Board. Work was halted by War Production Board stop-orders, or deferred because of the war.

more than a billion dollars worth of construction planned by the Bureau. Project planning activities and the preparation of designs and specifications were also carried forward during the year, primarily on projects included in the postwar inventory. Work was hampered by limited funds and the lack of trained personnel.

The Bureau is now resuming construction on a considerable number of projects. Among those slated for early development are the Columbia Basin project in Washington State, the Central Valley project in California and various projects in the initial development stage for the Missouri Basin. The report on the allocation of costs for the Columbia Basin project was submitted to the Congress during the year and repayment contracts setting forth the terms under which water users will repay part of the cost of constructing the irrigation system were to be submitted to landowners in the Basin at a special election in July.

The Federal Government now has an investment of \$952,893,000 in projects built and under construction by the Bureau of Reclamation. The cost of constructing the irrigation features of the projects actually in operation was slightly in excess of \$312,000,000, of which at the end of 1944, more than \$71,000,000 had been repaid by water users under Reclamation law. The gross value of crops produced on these lands for the single year 1944 amounted to more than the cost of building the irrigation systems.

More than 91,000 family-sized farms are provided with irrigation water through the 52 operating projects of the Bureau, and nearly five million people live in the areas served with irrigation and power from its systems.

Disruptions caused by the war have affected the work of the Bureau in many ways. More than 1,800 members of its staff, many of them skilled technicians, joined the armed services. Operations were hampered by shortages of manpower and materials. Needed repairs and maintenance work on irrigation systems and power plants were delayed.

An expanded irrigation acreage and development of other resources is necessary to insure the continued growth of the West. In the Pacific States and several of the Mountain States, population growth has outstripped agricultural production. The drought experiences of the Plains States, on the other hand, point to the need for increased irrigation to stabilize their agriculture and to stimulate development of other resources.

The war has placed a tremendous drain upon our natural resources. It is essential that remaining resources be conserved and utilized to the greatest possible advantage if the Nation is to continue its role of world leadership. To this objective the work of the Bureau of Reclamation is dedicated.

MISSOURI BASIN DEVELOPMENT

The Congress this year called upon the Department of the Interior and the Bureau of Reclamation to shoulder major responsibility for the biggest single development job in the Nation's history—that of harnessing the Missouri River and putting it to work as a constructive force in expanding the agricultural and industrial frontiers of the West.

The Bureau's program to control and put to greater use the waters of one of the country's most unruly and destructive rivers was approved by the Congress in passing the Flood Control Act of 1944, under which the coordinated plan of the Bureau and the Corps of Engineers for development of the Missouri Basin was adopted. The latter agency will be primarily responsible for flood control and navigation projects. The Bureau of Reclamation, working closely with other agencies of the Department of the Interior, will construct projects for irrigation and power development. The Congress authorized an appropriation of \$200,000,000 each for the Bureau and the Corps of Engineers in carrying out the initial phases of the program.

This comprehensive program for coordinated development of Missouri Basin resources surpasses anything of similar nature ever undertaken. It will affect a region embracing approximately one-sixth of the area of the continental United States, extending from the eastern slope of the Rockies in Montana where the Missouri starts its twisting 2,500-mile course, to where it empties into the Mississippi near St. Louis. The drainage area of the river and its tributaries includes 10 States—all of Nebraska, the Great Plains of Montana, North and South Dakota, Wyoming, Colorado, Kansas, parts of Minnesota, Iowa, and Missouri.

The magnitude of the engineering tasks involved in this development program can be realized from the fact that coordinated plans call for the construction of more than 100 dams to create storage reservoirs of 63,000,000 acre-feet capacity, almost equal to the present storage capacity of all present Bureau reservoirs combined. The works to be constructed will provide for irrigation, the development of hydroelectric power, flood control, improved navigation, municipal water supplies, fish and wildlife conservation and opportunities for recreation.

Projects to be constructed under the coordinated plan will aid greatly in stabilizing the agricultural economy of an area which has known the devastating effects of both droughts and floods. The projects proposed will provide for the irrigation of 4,760,000 acres of moisture-famished land never before irrigated, and for supplemental water for 547,000 acres now inadequately irrigated. A total of more than 150 major and subsidiary units for irrigation are contemplated in the seven arid or semiarid States of the Basin. Hydro-

electric plants with a capacity of 789,750 kilowatts and a power transmission grid are included. The estimated annual output of the power plants would approximate 4½ billion kilowatt hours.

In the initial stage of the unified plan the Congress authorized the construction by the Bureau of Reclamation of 29 units and a power transmission grid. When completed, these will irrigate 2,836,000 acres, and allow for installed power capacity of 321,000 kilowatts. The Bureau has started work on the plans for the first 11 units with a view to having them ready for beginning of construction in the next fiscal year.

The 29 initial Reclamation projects authorized by the Congress for construction in the Missouri River Basin are:

Kansas-Nebraska: Bostwick, Cedar Bluff, Frenchman-Cambridge, Kirwin, North Republican (Wray) (Colorado-Nebraska), pumping units for underground water in Republican Basin.

Montana: Canyon Ferry Reservoir, Glasgow Bench pumping, Hardin (including Yellowtail Dam), Marias, Missouri-Souris (Montana division), South Bench, and Yellowstone River pumping units.

North Dakota: Heart River, Knife River, Missouri-Souris (North Dakota division), and five Missouri River pumping units.

South Dakota: Angostura, Grand River (Shadehill-Bluehorse), Oahe (James River), and Rapid Valley (including Brennan Reservoir).

Wyoming: Big Horn pumping units, Big Horn project (Boysen Dam), Glendo Reservoir, Kortes, Owl Creek, Paintrock, Riverton, and Shoshone project extensions.

Transmission lines to carry energy generated by Bureau plants complete the list of initial projects.

The table below summarizes by states the irrigation and power development features of proposed Bureau projects under the coordinated plan:

State	New irrigated land	Supplemental supplies	Power plants	Installed capacity
	<i>Acres</i>	<i>Acres</i>		<i>Kilowatts</i>
Montana.....	967, 130	346, 800	6	308, 500
Wyoming.....	281, 560	167, 400	8	217, 000
Colorado.....	101, 280	1, 719		
North Dakota.....	1, 266, 440		3	458, 267
South Dakota.....	961, 210	11, 300	5	510, 500
Nebraska.....	989, 445	19, 930		
Kansas.....	193, 335	165		
Total.....	4, 760, 400	547, 304	22	1, 494, 267

The Flood Control Act, putting the congressional stamp of approval on the coordinated plan for Missouri Basin development, became law in December 1944. Two weeks later the Bureau called key members of its regional staffs at Billings and Denver to Washington for conferences with the Commissioner's staff to map out a program for starting work. A second conference was held at Denver in June at

which further plans were made, policies formulated, and the general organizational set-up for carrying out the program agreed upon. Also selected was a group of projects, from among the 29 authorized, on which construction could be started first.

For this comprehensive development job the Bureau will have the assistance and cooperation of many Federal agencies in addition to those in the Department of the Interior, and of State and local organizations in the Missouri Basin. Interior agencies working with the Bureau include the Geological Survey, National Park Service, Fish and Wildlife Service, Bureau of Mines, Office of Indian Affairs, General Land Office, and the Grazing Service, working through the Water Resources Committee of the Department.

Plans for project development are also coordinated through the Federal Inter-Agency River Basin Committee made up of representatives of the Department of the Interior, the War Department, the Department of Agriculture, and the Federal Power Commission. In April, a special subcommittee of this latter agency was set up to deal specifically with Missouri Basin developments. Known as the Missouri Basin Inter-Agency Committee, it is made up of representatives of the 4 Federal agencies named above and 4 governors representing the 10 Missouri Basin States.

The cost of constructing the projects approved under the coordinated plan is estimated at approximately 1½ billion dollars, based on 1940 prices. Many of the multiple-purpose projects to be built would be self-liquidating, and a major portion of the total investment would be returned to the Federal Treasury through payments by water users and through sales of electric power. Construction costs of flood control and navigation projects proposed under the plan would not be directly repayable but yield benefits far in excess of costs.

Construction of the initial projects in the Bureau's program for Missouri Basin development will be started as soon as the Congress makes the necessary appropriations and the manpower and materials become available.

The impact which a completed program of this magnitude will have upon the national economy can readily be imagined. It will provide thousands of jobs for returning servicemen, war workers, and others, not only at construction sites but at supply centers many miles away. The development of irrigation projects will help to stabilize the agricultural economy of a vast area periodically scourged by drought. The availability of low-cost hydroelectric power will stimulate business and industry, make possible development of untapped natural resources, and lighten the burdens of farm and city dwellers. Storage reservoirs to be constructed will minimize greatly the danger of floods in the lower reaches of the river. Approximately 53,000 new irrigated farms will be created. Population will be increased. Purchasing

power in the Missouri Basin States for commodities produced in other parts of the country will be expanded by many millions of dollars annually.

FOOD FOR A FIGHTING NATION

Food is as important in war as men and machines are. The men and women on the farms of America are as truly "war workers" as those employed in shops and factories to turn out planes and tanks. And wherever our fighting men have gone on all the battle fronts they have been the best fed, the best clothed, and the best equipped troops ever mobilized.

To make possible that achievement, the farm families of America have made a record in the production of food and fiber that is without parallel in the Nation's history. They have provided not only for the needs of our fighting forces but for our allies and the civilian population here at home.

The part which farmers on lands irrigated by Federal Reclamation projects have played in that record-breaking achievement is outstanding. The value of crops produced on Bureau-irrigated lands has more than doubled during the war years, partly reflected in increased market prices but also due to greatly increased production of war-essential crops and to additional acreage brought under irrigation.

CROP VALUES HIT RECORD LEVEL

During the past fiscal year, more than 4 million acres of land were served with irrigation water from Bureau projects, representing an increase of 759,000 acres over 1941 and 125,000 acres more than in 1943. The value of crops produced hit an all-time high of \$411,226,000, compared to \$159,886,000 in the pre-war year of 1941.

In meeting wartime food needs, farmers on Reclamation lands during 1944 produced 57,122,000 bushels of potatoes, 1,941,000 tons of sugar beets, 6,495,000 bushels of onions, 3,674,000 bushels of beans, 36,672,000 bushels of grain, and 49,000,000 bushels of truck crops. To maintain production of meat and dairy products at a high level, they also produced 4,360,000 tons of forage crops, including 3,830,000 tons of alfalfa hay. Production of apples, oranges, grapefruit, peaches, and other fruits and berries totaled 729,000 tons, and crops produced for seed amounted to 4,512,000 bushels.

The average per acre value of crops on Bureau-irrigated lands in 1944 was also the highest on record, an average of \$99.27 per acre, compared with a per acre average of \$47.30 in 1941. The highest average crop value in 1944 was reported for the Tieton division of the Yakima project at \$598.34 per acre, closely followed by the Okanogan project at \$592.32 per acre. Both are apple-growing districts in the State of Washington.

PROJECTS HAVE \$100-PER-ACRE RETURN

Gross crop values exceeding an average of \$100 per acre also were reported on the following projects: The Salt River (Arizona); Yuma (Arizona-California); Orland, Imperial Irrigation District and Central Valley (California); Fruitgrowers Dam and the Orchard Mesa division of the Grand Valley project (Colorado); Rio Grande (New Mexico-Texas); Klamath (Oregon-California); Owyhee Ditch Company (Oregon-Idaho); and Provo River and Weber River (Utah).

Tonnage of food and forage crops increased from 10,660,000 tons in 1943 to 11,369,000 tons in 1944. Of the cultivated area 26.1 percent was in alfalfa with production valued at \$67,978,000, 4.9 percent in potatoes valued at \$50,211,000, and 4.3 percent in seed crops with a value of \$24,333,000. Gross value of other crops produced in 1944 were: cotton, \$18,446,000; beans, \$13,363,000; sugar beets, \$20,623,000; truck crops, \$59,178,000; grains, \$39,610,000; and fruit, \$56,140,000. Principal volume increases occurred in alfalfa hay, grains, truck crops, and fruit.

The returns cited are exclusive of the values of livestock fattened on Reclamation projects and of dairy and poultry products. These would increase quoted totals by more than 25 percent.

TABLE 1.—Reclamation areas and crop returns, calendar year 1944 ¹

	Projects entirely constructed by the Bureau				
	Irrigable area ²	Irrigated area	Land subject to construction charges		
			Net area in cultivation	Crop values	
				Total	Per acre

² Area for which Bureau is prepared to supply water.

NOTE.—Per-acre value based on net area in cultivation.

LANDS LEASED FOR GRAZING

The Bureau had under lease during the calendar year 1944 approximately 964,000 acres, of which 799,000 acres were leased for grazing purposes; 64,000 acres for agricultural use; and 101,000 acres for other special uses. The above figures include 89,195 acres of patented land which have been acquired by the Bureau in connection

¹ Includes projects constructed by the United States and those for which supplemental water is furnished from storage works built by United States.

* Estimated.

with its projects. Revenues received by the United States for use of land in 1944 totaled \$195,805. The majority of the leased lands are withdrawn in connection with operation of completed projects. In addition, more than 700,000 acres of reclamation withdrawn land is now administered by the Grazing Service, with transfer of revenues to the Reclamation Fund. Under an agreement entered into February 28, 1945, between the Bureau and the General Land Office, vacant public lands under reclamation withdrawal may be temporarily transferred to the administration of the General Land Office until needed for reclamation purposes. At the end of the fiscal year, approximately 44,000 acres of such lands had been so transferred.

WORLD'S LARGEST POWER PRODUCER

Through a spectacular expansion in its generating facilities to meet the war emergency the Bureau of Reclamation has become the largest power producer in the world. From plants operating on its projects came nearly 14 billion kilowatt-hours of electric energy during the past fiscal year, much of it to war industries for the manufacture of planes and ships, aluminum, magnesium, and other materials and equipment for the fighting forces. Production of electric energy at Bureau projects has quadrupled since Pearl Harbor.

When the war is over this tremendous capacity for power production will be one of the most important factors in the continued industrial and agricultural expansion of the West. It will provide jobs, stimulate the establishment of new industry, aid in developing mineral resources and, in general, serve as the foundation for the establishment of a more balanced economy throughout the West.

POWER FOR WAR

From its beginning in the power field in 1909 with the 6,000-kilowatt Minidoka project plant in Idaho, the Bureau's installed capacity has grown to 2,439,300 kilowatts. This growth was required to keep pace with the needs for electrical power in areas served by reclamation projects and played a vital role in the tremendous expansion of war industries in the West. To meet demands, the installed capacity of Bureau hydroelectric plants was increased since 1941 by nearly a million and a half kilowatts, a gain of nearly 65 percent.

In the fiscal year 1945 the combined output of the plants operating on Bureau projects was approximately 14,000,000,000 kilowatt-hours. Revenues from the sale of energy were in excess of \$20,000,000.

Construction of new plant facilities has been virtually halted since 1942 because of the need for diverting critical materials to other war uses. During the past year an additional 82,500-kilowatt unit was installed in the plant at Boulder Dam, which has supplied a steady

stream of energy to aircraft and shipbuilding facilities, magnesium plants, and other basic industries. The plant at Boulder is the world's largest, and has a capacity of 1,034,800 kilowatts. The Shasta Dam power plant in northern California completed its first full year of operation with an output of 739,000,000 kilowatt-hours. Power from Grand Coulee Dam continued to be the mainstay of booming war industries in the Pacific Northwest. More than one-third of the aluminum used in airplane construction in the United States was produced from power generated by the Grand Coulee-Bonneville system. From Grand Coulee also came the large blocks of power for other important war purposes.

During the year the Bureau also completed construction of the 97-mile transmission line to Oroville which made possible the delivery of Shasta power to the connecting lines of the Pacific Gas & Electric Co. and thence into northern California war plants. The company serves as the marketing agency for this power under a wartime contract. The availability of Shasta power resulted in saving thousands of barrels of fuel oil that would otherwise have been required had the same energy been generated by steam plants.

POWER FOR PEACE

The postwar program of the Bureau calls for increasing the capacity of present plants to 4,000,000 kilowatts, principally by adding generating units for which space has been provided in constructed plants. Additional installations at projects included in the postwar inventory call for generating plants which will give the Bureau of Reclamation a total power capacity of about 9,000,000 kilowatts. Of this, about a million and a half kilowatts will be in plants strategically located in states of the Missouri Basin to aid in the further development of that great area.

The demands of wartime have served to emphasize what officials of the Bureau of Reclamation have long recognized—the importance of developing the power resources of our western rivers along with the utilization of their waters for irrigation and other purposes. The availability of such low-cost power is essential on many projects for irrigation pumping, but it is even more important as a stimulant to the development of industry and business to go hand in hand with agricultural expansion in establishing a balanced economy.

Revenues from the sale of such power helps repay to the Federal Treasury a major portion of the cost of constructing many reclamation projects. Without that source of repayment revenue, projects which are now contributing so much to the Nation's agricultural production and providing homes and jobs for thousands of people could not have been constructed without a much greater net cost.

Under reclamation law, most of the investment which the Govern-

ment makes in these irrigation projects is repaid over a period of from 40 to 60 years by water users, and the revenue from sale of electric energy to municipalities and individuals.

The mighty contribution which the West has made to war production since 1941 would not have been possible without the power-producing facilities of Bureau projects, and after the war they will play an even more important role in developing the great latent resources of the vast area between the Mississippi and the Pacific.

POSTWAR PLANS TO DEVELOP THE WEST

While pushing its programs to aid in winning the war the Bureau of Reclamation also laid a solid foundation for a program to meet the problems of peace. This program was presented to the Congress in April in the form of an inventory of 415 irrigation and multiple-purpose projects which the Bureau is prepared to undertake in further developing the resources of 17 Western States and to provide jobs and farms for thousands of returning servicemen and demobilized war workers.

This inventory of projects included more than 100 which have already been authorized by the Congress, 29 of them as part of the Bureau's coordinated program for development of the Missouri Basin.

Construction of these authorized and proposed projects would provide jobs at peak employment for more than 400,000 workers at construction sites and a great many more workers in factories, mines, and transportation systems throughout the country.

The cost of constructing these projects—those authorized and those under study—is estimated at close to 5 billion dollars, based on 1940 costs. The estimated construction cost to complete projects already authorized by the Congress is \$1,337,701,000.

Nearly 200,000 irrigated farms would be made available for settlement by veterans and others upon the completion of these projects. They would bring water to nearly 11 million acres which have never before been irrigated, and supplemental water to an additional 11 million acres which now have inadequate water supplies. Thus, a total of 21 million acres would be served in stabilizing the agricultural economy of these 17 Western States and contributing to the welfare of the Nation as a whole.

Another very important contribution which these projects would make in developing the resources of the West to the benefit of the whole country is the tremendous increase in the output of electrical energy which would be made possible by harnessing these western rivers through multiple-purpose projects. Power plants on Bureau projects now have an installed capacity of 2,439,300 kilowatts, with

a total output in 1944 of nearly 14 billion kilowatt-hours. The postwar program calls for increasing the capacity of present plants to 4,863,000 kilowatts principally by adding generating units for which space was provided in original construction. Additional installations in the postwar inventory call for the addition of generating units which would give Bureau of Reclamation plants a total capacity of 9,324,000 kilowatts.

A summary of the Bureau's postwar inventory of projects is given below:

State	Number of projects	Irrigation		Power		Over-all remaining costs, 1940 prices

¹ Total includes individual units of some major projects. Miscellaneous projects not included.

The speed with which construction of these projects can be undertaken will depend largely upon the action of the Congress in making the necessary appropriations and upon the availability of manpower and materials. Work is in progress under war food and war power programs on many of the authorized projects and work on others has been halted or deferred because of the war.

The development program proposed by the Bureau is important both from the standpoint of what it can do toward helping the Nation in meeting some of the immediate reconversion problems, and also because of its promise for long-range development of the agricultural and industrial resources of the West. It is a program that permits a quick get-away. Provided with funds and manpower to complete field investigations and preconstruction work, as well as appropriations for actual construction, the Bureau could put from 150,000 to 200,000 men to work at project sites the first year. Peak on-site employment could be reached in the second or third year. Although construction would be centered in the Western States, more than half of the resulting employment would be in mines, mills, and factories of the

ment makes in these irrigation projects is repaid over a period of from 40 to 60 years by water users, and the revenue from sale of electric energy to municipalities and individuals.

The mighty contribution which the West has made to war production since 1941 would not have been possible without the power-producing facilities of Bureau projects, and after the war they will play an even more important role in developing the great latent resources of the vast area between the Mississippi and the Pacific.

POSTWAR PLANS TO DEVELOP THE WEST

¹ Total includes individual units of some major projects. Miscellaneous projects not included.

The speed with which construction of these projects can be undertaken will depend largely upon the action of the Congress in making the necessary appropriations and upon the availability of manpower and materials. Work is in progress under war food and war power programs on many of the authorized projects and work on others has been halted or deferred because of the war.

The development program proposed by the Bureau is important both from the standpoint of what it can do toward helping the Nation in meeting some of the immediate reconversion problems, and also because of its promise for long-range development of the agricultural and industrial resources of the West. It is a program that permits a quick get-away. Provided with funds and manpower to complete field investigations and preconstruction work, as well as appropriations for actual construction, the Bureau could put from 150,000 to 200,000 men to work at project sites the first year. Peak on-site employment could be reached in the second or third year. Although construction would be centered in the Western States, more than half of the resulting employment would be in mines, mills, and factories of the

Midwest, East, and South. It would mean jobs for thousands of workers in manufacturing materials and machinery—iron and steel products, cement, electrical equipment and supplies, foundry and machine-shop products, and lumber, from their beginning as raw materials, their transportation to the factory for fabrication, their processing, and again their transportation to the place where they are used. Thus every State is affected by western construction.

The benefits that would be derived from these projects would not end with the construction of the engineering works but go on for generation after generation to increase agricultural production, stimulate industry, increase purchasing power, create new opportunities for business, trade and professional people in towns serving project areas. So not only the West but the entire Nation would be benefited permanently.

For 43 years the Bureau of Reclamation has been working on programs for developing the land and water resources of the West. The value of those developments has been effectively demonstrated during the war. The need for continuing and expanding such developments has also been demonstrated. At present there are about 2½ million more people living in the 11 far Western States than there were before the war. This is a population increase of 17.8 percent, compared with a national increase in the same time of only seven-tenths of 1 percent. Many of these new residents of the West will remain in the region. In addition more than 1,000,000 western boys will be demobilized from the armed forces. They will want jobs, they will want opportunities to start farming, to practice their trades and professions, to open business establishments. An increase in the basic irrigated agriculture of this area will therefore be necessary to support and sustain the growth and the continuing industrial expansion of these States. It is to meet this challenge and to open up a new frontier of opportunity in the West that the Bureau of Reclamation presents its postwar program.

RIVER BASIN STUDIES PROGRESS

The Branch of Project Planning gave major attention during the year to projects proposed for construction after the war.

Field staffs concentrated on the completion of the comprehensive engineering and economic investigations and reports on 15 major river basins in the West, in addition to sub-basin and project studies. The objective of these studies is to present a comprehensive and overall plan of development on a basin-wide scale to bind the various projects and units into an orderly and logical program for the most effective utilization of land and water resources.

The first of these basin reports—covering the Missouri River Basin—was presented to the Congress last year (S. Doc. 191). Further studies of projects and sub-basins in the Missouri Valley are continuing. Reports on other major western river basins in various stages of completion by the Bureau are: Columbia River Basin, Rogue River Basin, Central Valley, Santa Barbara County, Russian River Basin, Lower Colorado River Basin, Upper Colorado River Basin, Great Salt Lake Basin, Nueces River Basin, Rio Grande Basin, Red River Basin, Pecos River Basin, Guadalupe River Basin, Colorado River (Texas) Basin, and Arkansas River Basin.

SPECIAL STUDIES TO AID SETTLERS

In addition to these basin reports and studies of individual projects in the postwar inventory, the Bureau brought to substantial completion during the year its special studies of the two largest Reclamation projects on its postwar development schedule, the Columbia Basin project in south-central Washington and the Central Valley project in California.

Published during the year were 3 of the 28 special reports prepared by the Columbia Basin Joint Investigations Committees—Types of Farming, Rural Recreational Areas, and Insuring Proper Land Use. Additional studies in the series are scheduled for publication during the coming fiscal year.

Also completed during the year were similar special studies for aid to settlers on the Central Valley project. The studies embrace a great volume of factual material on all phases of the proposed development of the project and were prepared by the Bureau in cooperation with a great many Federal and State agencies. Publication of some of the Central Valley studies is also planned for next year.

CONSTRUCTION ACTIVITIES LIMITED

Construction activities of the Bureau continued during the year on a restricted basis, confined almost entirely to projects under war food and war power programs.

The 37-mile Madera Canal on the Central Valley project was completed late in the fiscal year. It will provide water for irrigating about 20,000 acres of new land and supplemental water for 80,000 acres in the fertile San Joaquin Valley. An application to start construction on the 160-mile Friant-Kern Canal was pending before the War Production Board. Twenty-nine projects were cleared under the war food program.

Ten dams were partially completed at the end of the year, as follows:

Concrete dams

Dam	Reservoir capacity	Height	Complete
	<i>Acre feet</i>	<i>Feet</i>	<i>Percent</i>
Altus.....	151,650	110	98
Keswick.....	23,689	130	8

Earth dams

Anderson Ranch.....	500,000	456	66
Newton.....	5,500	101	97
Deerfield.....	15,000	120	75
Scotfield.....	65,000	68	50
Wickiup.....	180,000	100	8
Box Butte.....	31,500	66	75
Jackson Gulch.....	10,000	150	20
Shadow Mountain.....	15,000	48	60

A total of 144 miles of transmission lines was completed and construction of an additional 308 miles was in progress. Fifty miles of canals were built and work on other water distribution facilities for war food production was continued. Construction during the year involved the use of more than 300,000 barrels of cement, and 220,000 cubic yards of concrete were placed.

Construction of Anderson Ranch Dam on the Boise project in Idaho passed the half-way mark. When completed it will be the highest earthfill dam in the world. The reservoir created will provide flood control, and store irrigation water for 290,000 acres now receiving an inadequate supply. On the Deschutes project in Oregon an earth dam is under construction to provide irrigation for approximately 20,000 acres, and construction also was continued on the canals and distribution system for irrigating 32,000 acres on the Yakima Roza project in Washington.

Clearance was granted for the installation of additional equipment for the power plant and for emergency repair work on the spillway bucket at Grand Coulee Dam. On the Tucumcari project in New Mexico, work was completed on the first section of the Conchas Canal to provide irrigation water for an initial block of 7,000 acres.

Construction also progressed on the Gila project in Arizona and on the Coachella Canal in Southern California. Other construction included guniting over the dry rock paving in the desilting basins at the headwaters of the All-American canal, preparation of the designs and specifications for the construction of the \$17,000,000 San Diego Aqueduct, continued construction on the Salt Lake Aqueduct, flood control work on the Colorado River, and concrete lining work on the 13-mile Alva B. Adams Tunnel under the Continental Divide.

A limited program of construction was also carried on at Green Mountain and Shadow Mountain Dams on the Colorado-Big Thomp-

son project in Colorado, and on the following projects cleared for construction under the war food program: Rapid Valley, S. Dak., Newton and Scofield, Utah, Mirage Flats, Nebr., Mancos, Colo., and Lugert-Altus, Okla.

DESIGNS PREPARED FOR POSTWAR PROJECTS

The Branch of Design and Construction concentrated on the preparation of designs for postwar projects, so that work might begin on a considerable volume of construction whenever war conditions permit. In planning for this postwar development of land and water resources, preliminary designs and estimates were made for 15 concrete and 10 earth dams, 40 power plants, 9 pumping plants, 2 water supply systems, and for canals and water distribution facilities on 15 projects. In addition to these, design studies were started on features of numerous other postwar Reclamation projects.

Primarily, construction work on projects authorized by the War Production Board has been for the purpose of food and power production. The War Production Board authorized work on 21 Bureau projects during the fiscal year, but due to labor and materials shortages, some projects did not progress as planned. Efforts to conserve critical war materials has resulted in increased construction costs on some project features and at times has necessitated design changes.

TECHNICAL ADVANCES

Outstanding technical advances included the development of the hollow-jet regulating valve, and the development of the transformer reactance voltage-drop compensator. The hollow-jet valve will provide more economical installation and maintenance and improved operation for water outlet regulation. The voltage-drop compensator permits the adjustment of electric potential measuring devices in about one-tenth the time required by previous methods. During the year an inexpensive integrating machine was developed which will materially facilitate computations for design where differential equations are involved and which has possibilities for application in mathematical studies elsewhere.

BUREAU AIDS OTHER UNITED STATES AGENCIES

During the war, Bureau engineering and laboratory personnel and facilities were called upon to assist the War and Navy Departments, as well as other Government agencies and private corporations concerned with the war program, in solving a wide diversity of numerous technical engineering problems.

The Bureau cooperated with the Bureau of Mines by furnishing power for research, and with the Geological Survey in exploration for

strategic minerals, by providing technical assistance and laboratory facilities. The Bureau cooperated also with the War Department, the Geological Survey, and the Department of Agriculture in interchange of information and technical data.

WORLD'S BIGGEST DAMS

The engineering accomplishments of the Bureau of Reclamation are known the world over. Its engineers have tamed the mighty rivers in the West and put them to work at transforming barren lands into productive farms and to producing power for man. The three biggest concrete dams in the world have been built by the Bureau of Reclamation—Grand Coulee Dam on the Columbia River in Washington, Shasta Dam on the Sacramento River in California, and Boulder Dam on the Colorado River between Arizona and Nevada.

The Bureau has built 15,495 miles of irrigation canals—enough to cross the continent five times. The storage reservoirs behind these dams have a capacity of 66,558,840 acre-feet. It has built 347 tunnels with a combined length of 560,271 feet. Operating on its projects are hydroelectric plants with an installed capacity of 2,439,300 kilowatts, part of the energy produced being marketed over 2,164 miles of transmission lines built by the Bureau.

In the construction of its projects the Bureau has excavated 606,313,120 cubic yards of earth and rock, poured 33,671,861 cubic yards of concrete, used 38,289,133 barrels of cement. It has built 209,016 canal structures, 5,196 miles of waste water ditches and drains, 13,676 bridges, 23,620 culverts, 6,310 flumes with a combined length of 873,989 feet, and 331 pumping plants.

OPERATION AND MAINTENANCE PROGRAM

Operation and maintenance activities on the 52 operating Federal reclamation projects were devoted first and foremost to furnishing irrigation service needed to maintain record-breaking agricultural crop production. The stabilization of these projects to protect Federal investment is important, as are also steps which have been taken to aid in assuring the success of the water users through improved irrigation practices, land-use and related activities, and settlement.

A special effort was made again during the year to provide for full use of Reclamation withdrawn lands for grazing purposes to support the livestock production in the West.

Activities carried on in the field by this branch of the Bureau of Reclamation for the benefit of water users and to facilitate pro-

operations included: (a) programs for improved operations of projects and preparations for operations, land use, and settlement on projects under construction or authorized; (b) land reclassifications; (c) thorough economic analyses in connection with the negotiation of amendatory repayment contracts and the deferment of construction charges. Plans for the land purchase, development and settlement of the Columbia Basin project were a major goal. Cooperation with State agricultural colleges and other agencies was advanced.

Field work was completed or in progress on the reclassification of irrigable lands on 16 projects or divisions of projects, involving approximately 309,000 acres.

FIELD ORGANIZATIONS ESTABLISHED

Progress was made during the year in setting up operation and maintenance organizations in regional offices. This was in line with the decentralization program of the Bureau to place supervision and contacts closer to operations and to the water users affected, and also to prepare for accelerated operation and maintenance programs that will be needed with the end of the war in connection with project settlement.

The Operation and Maintenance branch was transferred from Denver to Washington during the year. The work of the branch has been primarily directed at (1) the delegating of direct supervisory responsibility of field operations to regional and project offices; (2) development of programs with emphasis on land-use and "the human side" of reclamation, particularly with respect to aiding veterans in settling on irrigated farms, and (3) the review of repayment contracts to determine the need for adjustment in repayment schedules, based on the ability of water users to meet such payments.

AMENDATORY REPAYMENT CONTRACTS

Section 17 (b) of the Reclamation Project Act of 1939 authorized temporary relief from payment of accrued construction charges for each of the years 1939 to 1943, inclusive, in cases where such payments could not be met due to circumstances beyond the control of water users. During the fiscal year, five water users' organizations submitted applications for relief from payments totaling \$209,001.30. Four of the five requests concerned 1944 construction installments. No legislation existed for consideration of these requests until passage of Public Law 39 (79th Cong., 1st sess.) on April 24, 1945.

Action taken during the fiscal year to defer construction charge payments granted relief to five water users' organizations, for 1942 and 1943 installments, in the total amount of \$208,214.41. Postponements of payments were recommended due to the critical finan-

cial condition of the applicant irrigation districts as a result of a growing season, grasshopper infestation, hailstorms, low production influenced by labor shortages, and other factors. At the close of the fiscal year five applications as to 1944 charges, as well as a request for deferment of 1943 charges, were awaiting final action.

An inventory was prepared early in the year of repayment contracts in force, to be used in the various regions in negotiating amendatory provisions of such contracts. To date, 10 amendatory contracts have been executed under provisions of the Reclamation Project Act of 1916.

WATER CONSERVATION AND UTILIZATION PROGRAM

Work was continued on six projects authorized for construction under this program before the war, and on two new projects on which construction was initiated during the year. Preconstruction activity was under way on four additional projects approved under the war food program.

Projects under construction were: Mirage Flats (Nebraska), Big Rapids No. 2 (Montana), Newton (Utah), Rapid Valley (South Dakota), Mancos (Colorado), Intake (Montana), and the Post Falls unit of the Rathdrum Prairie project (Idaho). Other Water Conservation and Utilization projects cleared for construction are Missoula Valley (Montana), Dodson Pump Unit, Milk River project (Montana), Bitter Root (Montana), and Balmorhea (Texas).

Construction remained at a standstill on the Eden project (Wyoming) and the Fallon Unit of the Buffalo Rapids project (Montana) because of War Production Board stop orders.

WAR RELOCATION CENTERS

Three relocation centers continued to operate on Bureau property during the year. These projects in 1942 became sites for reconstructed barracks-cities to care for more than 35,000 persons of Japanese ancestry evacuated from the West coast. The centers were operated by the War Relocation Authority on the Heart Mountain Division of the Shoshone project (Wyoming), Gooding Division of the Minidoka project (Idaho), and the Tule Lake Division of the Klamath project (California-Oregon).

The population at the first two of these centers has been greatly reduced during the past year through the efforts of the War Relocation Authority in providing resettlement opportunities for evacuee families in many parts of the country. As a result, most of the

acreage in project lands used by residents of the centers to provide food for their own needs, is being turned back to the Bureau.

The Bureau in turn is leasing this land to private operators for continued production of food and forage crops. Both the Heart Mountain and Minidoka centers are scheduled to be closed within the next few months. Part of the irrigation system on each project was developed under the direction of Reclamation engineers, with construction work and farm operations carried on by the evacuees.

C. P. S. CAMPS

On four other Reclamation projects Civilian Public Service crews, under the Selective Service program, have helped to relieve labor shortages in continuing construction and development work. At the Mancos project (Colorado) an average of 149 Civilian Public Service workers were employed during June. Construction of Deerfield Dam on the Rapid Valley project (South Dakota) was continued by Civilian Public Service labor, a 150-man camp being maintained. Approximately 95 Civilian Public Service assignees were employed on the Deschutes (Oregon) project. These men were used for firefighting, operation and maintenance, and clean-up work. During the irrigation season the Department of Agriculture Camp furnished a few Civilian Public Service assignees for similar work on the Buffalo Rapids project (Montana). There were not enough workers available, however, to advance construction on the project.

PLANS FOR VETERAN SETTLEMENT

The branch was actively engaged in developing a program for the settlement of veterans and others on public lands on projects for which irrigation facilities are constructed and in helping irrigation districts and local interests to advance settlement on privately owned lands in projects under construction. Restricted construction of irrigation facilities during the war limited the settlement opportunities that could be made available in 1945-46, but resumption of construction work was expected to increase materially the number of irrigated farms on public and privately owned lands that could be offered. Preference is provided for veterans under existing law in settlement of public lands.

TABLE 3.—Settlement and economic data—1944

¹ Farms furnished partial or whole water supply by Bureau-constructed works.

² Gravity division only; does not include Orchard Mesa Irrigation district.

³ Two farms in predevelopment program; 1 farm leased.

⁴ Data not reported.

REGIONAL ACTIVITIES EXPANDED

Substantial progress was made during the year toward completing the Bureau's program of decentralization and in expanding the activities of seven regional offices set up under that program. Inaugurated in September 1943 the regionalization of the Bureau is designed to coordinate activities in each of the major watersheds of the West, and to place supervision closer to the field of operations. A summary of the most important activities in each of the regions is given below:

REGION 1

Fourteen operating Bureau projects in the Pacific Northwest produced crops valued at \$178,265,000 during the crop year of 1944, and power plants operated by the Bureau delivered almost 6 billion kilowatt-hours of electric energy to war industries. This region includes the States of Washington and Idaho, all but a small portion of Oregon, part of western Montana, and small areas in Wyoming and Nevada.

The gross value of crop returns on Bureau projects in this area in 1944 exceeded 1943 by \$7,890,000 and averaged \$99.44 per acre. In addition to many other food crops, the irrigation farmers of the region raised 40,234,832 bushels of potatoes, an amount sufficient to provide a year's supply for 19 million persons; 838,517 tons of sugar beets, sufficient to provide 8 million persons with a year's supply of sugar; and 1,648,360 tons of alfalfa, which, on being fed to beef and dairy herds, provided the equivalent of an annual supply of milk for 2½ million persons plus an annual supply of beef for 2½ million persons.

In the production of power, the four Bureau multiple-purpose projects in the Northwest produced 5,894,969,245 kilowatt-hours of energy during the 1945 fiscal year. This production to a large extent made possible the huge output of aluminum and other war supplies in the area.

Largest of the power producers was Grand Coulee Dam with an output of 5,716,661,000 kilowatt-hours. There was a steady growth in this project's contribution to war industries consuming huge blocks of electrical energy, and the total output since operations were started in March 1941 amounted to approximately 15,232,375,000 kilowatt-hours by the end of the fiscal year. Although the present installation of the power plant is less than half its ultimate capacity, it continues to hold the unchallenged world's record for producing the largest quantity of hydro power in a single month: 621 million kilowatt-hours in March 1944.

Construction activities continued on a curtailed basis during the year. Work on Anderson Ranch Dam on the Boise project passed the half-way mark. On the Post Falls unit of the Rathdrum Prairie project in Idaho work was going forward on construction of a pumping

plant and discharge line. An earth dam and canals are being built on the Deschutes project in Oregon, and work was resumed under the war food program on canals and distribution system for the Yakima-Roza project in Washington.

The Northwest is mindful of this wartime food and power production record as it regards the Bureau's inventory of new projects for the postwar period and analyzes the significant features of that inventory.

Forty-seven potential developments in the States of Idaho, Oregon, Washington, and western Montana are "inventoried," and many of these would be multiple-purpose in scope. They would bring under irrigation 1,970,195 acres of new land, provide a supplemental supply to 1,552,855 acres now suffering with shortages, add 1,084,500 kilowatts of installed capacity in existing Bureau power plants, and provide 753,420 kilowatts of new firm power on projects under study.

REGION 2

An increased production of food for military and civilian needs and of electric power for war industries marked operations of Bureau projects in region 2, largest of which is the Central Valley project. The region includes three-fourths of California and a small area in Oregon. Construction was completed during the year on the 37-mile long Madera Canal to provide water for irrigating approximately 100,000 acres of land in the fertile San Joaquin Valley. The power plant at Shasta Dam, completing its first full year of operation, generated 739,000,000 kilowatt-hours of electricity to turn the wheels of California's wartime industry.

While contributing to the war program, the region also moved ahead with its plans for meeting the problems of peace. Thousands of jobs will be created and hundreds of irrigated farms made available for settlement through further development of the Central Valley project and 36 other projects included in the Bureau's postwar inventory. The first of these projects on which work will start in the immediate future is the 156-mile Friant-Kern Canal. The War Production Board approved construction of the initial 5.6-mile section in June. The canal, when completed, will extend from Millerton Lake, the reservoir created by Friant Dam, to the Kern River near Bakersfield, to provide water for irrigating 358,000 acres of new land in the highly productive San Joaquin Valley and supplemental water for an additional 374,000 acres threatened by shortages.

Millerton Lake, the reservoir created by Friant Dam, reached full capacity and overflowed the spillway of the dam for the first time on June 30. Storage capacity of the reservoir for irrigation and flood control purposes will be increased by 83,000 acre-feet with the installation of three drum gates and other control facilities on the spillway

section of the dam. Contracts for this installation are scheduled to be let early in the next fiscal year. The reservoir in 1944 provided water for irrigating 32,500 acres of land for crops and 110,000 acres for pasture land for more than 140,000 head of cattle. Water-marketing contracts were in process of negotiation with 12 irrigation districts in the San Joaquin Valley as the fiscal year drew to a close.

The Bureau has also initiated negotiations with several municipalities in the Sacramento area for a larger market for power generated at Shasta Dam. Although the plant operated at only two-fifths of its ultimate capacity during the year because the war deferred installation of full generator capacity, its output represented a saving of 1,400,000 barrels of oil which would have been consumed as fuel by steam-plant production of the same amount of power. An application was pending before WPB for the return to Shasta of two 75,000-kilowatt generators "loaned" to the Coulee Dam plant because of the war emergency. Release of water from Shasta Reservoir helped provide for irrigation needs in the Sacramento Valley, enabled farmers to double the acreage of rice, and helped protect \$14,500,000 worth of crops by controlling salt-water intrusion in the delta. Record crops were grown on the Klamath project in southern Oregon and 16,300 carloads of food were shipped.

Work was continued during the year on plans for postwar developments in the region and on preparation of comprehensive reports of projects and river basins. The Central Valley Basin report was in final stage of completion, recommending a program which would double the irrigated acreage in Central Valley through construction of 38 reservoirs for storage of 30,000,000 acre-feet of water now largely wasted. Cost of the program is estimated at \$1,800,000,000 based on 1940 prices, and benefits from such development would amount to an estimated \$275,000,000 annually. The report on Santa Barbara County investigations has been completed and is now in Washington for review. Joint investigations by the Bureau and the Corps of Engineers on the Salinas and Russian River Basins are in progress. Plans also progressed during the year for developing the recreational facilities of Millerton Lake and Shasta Reservoir, the work to be under the general direction of the National Park Service.

REGION 3

This region is the "powerhouse" without which the record production of war industries in southern California would not have been possible. From the giant power plant at Boulder Dam alone, came 6 billion kilowatt-hours of electric energy used in turning out planes and ships, in processing magnesium, and in producing other equipment and materials so vital to the war effort. From the farms irrigated by Bureau projects in this area, which embraces the State of Arizona,

southern California, and small portions of Nevada, New Mexico, and Utah, also came great quantities of food for the armed forces and the civilian population.

More than half of the electric power used by war industries in this region was produced at Bureau-operated hydroelectric plants, of which the one at Boulder Dam on the Colorado River is the largest in the world. An additional 82,500-kilowatt generator was added to the plant during the year, bringing its total capacity to 1,036,000 kilowatts. Its output of 6 billion kilowatt-hours of energy yielded a revenue of \$8,574,300. Including the power output at two smaller plants, one at Parker Dam below Boulder, the other on the Yuma project in Arizona, a total of 6½ billion kilowatt-hours of energy was produced.

Region 3 continued its substantial contribution to the Nation's war food supply. Crop production, for the calendar year 1944 from 743,018 acres served by Reclamation facilities, was valued at \$112,780,-437 and exceeded by \$3,407,259 the record production established by the region's farmers in the previous year.

On the 150,000-acre unit of the Gila project (Arizona), approved for construction, leveling operations were completed on 5,000 acres of public land in the 8,500-acre tract cleared by the War Production Board as a dust control project for the important Yuma Air Base. Over 1,300 acres are now in alfalfa and the remainder of the public land will be seeded to a sudan grass cover crop during the summer and to alfalfa in the fall of 1945. On the All-American Canal project (California), construction was progressing rapidly at the end of the year on the Coachella Canal which will bring water to 22,000 acres.

Members of the region 3 staff and other Bureau personnel have also been in charge during the past year of preconstruction surveys and the preparation of designs and specifications for the \$17,500,000 aqueduct to provide a water supply for the city of San Diego from the Colorado River.

All possible effort, with curtailed personnel, is being made in the planning of the region's 35 projects in the inventory of projects for postwar construction. Emphasis is being placed on those projects that can go forward immediately as the Nation converts from war to peace. The potential program, which would require an expenditure of upwards of \$1,000,000,000 would supplement and insure the water supply for some 600,000 acres presently irrigated but without an adequate water supply, as well as furnish water for some 800,000 acres of lands not now irrigated. In addition to the irrigation benefits, these multiple-purpose projects would add 1,885,000 kilowatts of hydroelectric capacity to the Region's power pool.

Resumption of work on Davis Dam, halted late in 1942, has been authorized by the War Production Board. This dam, 65 miles downstream from Boulder Dam, will aid in regulating the flow of the Colo-

rado River for downstream uses and provide means of compliance with the pending treaty with Mexico.

Construction work on a large scale can be resumed at short notice on the Gila and All-American Canal projects. These projects when completed and developed will provide for, roughly, 3,000 new family-size farm units. Study of the Central Arizona project, a project to divert water from the Colorado River to the highly developed irrigated agricultural area near Phoenix now sorely in need of supplemental water, is receiving priority attention. The State of Arizona is cooperating in the investigations of this project. Progress on the many other projects in the inventory will be accelerated as additional personnel and equipment become available.

REGION 4

Region 4 increased its contribution to the winning of the war while carrying on limited construction activities and speeding up postwar plans for basin-wide development of water resources. This region includes most of Utah and Nevada, that part of Wyoming and Colorado west of the Continental Divide, and small sections of Idaho, New Mexico, and Arizona.

Food for fighting men and industrial war workers was the major contribution to the war from 18 projects in operation in the region. Such operation included the storage of water in 13 Bureau reservoirs, with an aggregate capacity of nearly 1,365,000 acre-feet, in addition to the distribution and handling of other water supplies for irrigation. Approximately 494,000 acres irrigated by these projects in 1944 produced crops valued at \$35,000,000, an increase of over 50,000 acres and \$500,000 respectively during the year.

The West's big \$200,000,000 steel plant at Geneva, Utah, was furnished an increased industrial water supply from the Provo River project. The city of Ogden, Utah, threatened with a water shortage, continued to receive protection for its municipal supply from Pineview Reservoir, which, also, furnished water to war housing facilities and the Army's Bushnell Hospital in the area. The armed forces benefited from the services of 33 experienced engineers on military leave from the region. Reclamation reservoirs provided recreational opportunities for thousands of people.

Construction continued on the Mancos project, Colorado, and the Newton, Provo River, and Scofield projects, Utah. Sufficient progress had been made on the enlargement of two canals and a section of the Provo River Channel, Provo River project, to furnish a supplemental water supply of 28,000 acres of highly developed lands. A 6-mile pipeline section of the 40-mile Salt Lake Aqueduct was constructed, bringing to completion about 20 miles of the conduit that will carry water to Salt Lake City and other municipalities and in-

dustries in the area. Work was advanced on Scofield Dam and highway and railroad relocations. Work was still suspended by War Production Board stop-order on the 6-mile Duchesne Tunnel of the Provo River project, the Eden project, Wyo., and three small reservoirs of the Ogden River project.

In project planning activities, emphasis was placed on the formulation of general basin-wide plans for full utilization and control of water resources in three river basins. Preliminary reports outlining comprehensive plans for ultimate development in the Colorado River and Bonneville Basins were prepared and submitted informally for review and comment to the States and local interests concerned.

The Colorado River report, prepared in cooperation with region 3, outlines some 92 projects in the upper basin to provide 1,200,000 acres of new land with a full irrigation supply and 500,000 acres of inadequately irrigated land with a supplemental supply. Potential hydroelectric power plants are outlined with installed capacities aggregating 1,700,000 kilowatts and annual firm power generation exceeding 9 billion kilowatt-hours.

The Bonneville report describes 13 potential projects, including those that would import water from the Colorado River Basin, to bring a full irrigation supply to 350,000 acres not now irrigated and a supplemental supply to 325,000 acres insufficiently irrigated. In addition 1.2 billion kilowatt-hours of energy could be produced in hydroelectric plants, and flood control and other benefits provided. A report was well advanced on the Lahontan Basin, and detailed project investigations were being conducted and plans and estimates were being prepared for several projects in these three basins which are recommended for initial construction in the postwar period.

REGION 5

Maintenance of a high level of agricultural production on operating projects, continued construction on three war-food projects and planning for a program of postwar development marked the activities of region 5 during the current fiscal year.

The 6,534 irrigated farms in the Carlsbad and Rio Grande projects in New Mexico and Texas produced crops last year valued at \$23,205,821. The crops were grown on 174,858 acres, and the cash income averaged \$132.10 an acre. Almost 17,000,000 kilowatt-hours of hydroelectric power, with revenue amounting to \$329,447.90, were produced last year at Elephant Butte Dam on the Rio Grande project in New Mexico.

Construction in the region during the year was centered principally on the Altus, Oklahoma, and Tucumcari, New Mexico, projects, and to a minor extent on the Balmorhea and Marshall Ford Dam projects in Texas, and the Fort Sumner project in New Mexico.

Altus Dam and a major portion of the reservoir storage system, including relocation work on highways and the main canal from the dam to the project boundary, were completed. Water will be delivered to a part of the project in the fiscal year 1946.

Construction of the Tucumcari project was continued and water for the first 7,000-acre unit of project lands is scheduled for delivery early in the next fiscal year. Plans were also being made to rush construction of a 64-mile transmission line from Las Cruces to Alamogordo, New Mexico, to supply power for the Alamogordo Army Air Field and the United States Army's Ordnance proving grounds at White Sands.

Comprehensive reports on basin-wide investigations of the Rio Grande, Nueces, Guadalupe, and Colorado Rivers were completed, and the tentative drafts submitted to the Commissioner. Investigations in the Red and Arkansas River Basins were approximately 75 percent completed. Reports for the Canton and Middle Rio Grande Valley projects were in final stages of preparation, and surveys were initiated on the San Juan-Chama diversion. A power market survey in the Alamogordo, New Mexico, area was completed, two land-use programs were developed for the projects under construction, and a review was made of the land classification surveys for both projects. Approximately 600 acres were leveled on the Altus project and several thousand acres were cleared and leveled on the Tucumcari project. A demonstration farm was initiated on the Altus project.

The war has affected Bureau operations in many ways. Construction was limited to those projects considered essential under either the war food or war power program and even on such projects was carried on under severe handicaps. The increased cost of labor and materials on the two projects under construction is estimated at nearly \$11,000,000. The increased cost of project planning surveys, for salaries and wages alone, is estimated in excess of \$100,000. Serious losses, though not always tangible, were sustained on crop lands under the drive of all-out production for war. Farmers, in many instances, abandoned normal crop rotation plans in order to meet food goals, increased acreages of soil-depleting crops, were unable to carry out usual fertilizer programs because of shortages in materials, equipment, and manpower. It is estimated that crop production on the two projects under construction would have increased by \$7,000,000 had it not been for the war, and this does not include the value of livestock, poultry, and garden truck that would have been produced had the projects been completed and made productive. Also, more than a million acre-feet of water has spilled over Conchas Dam since December 1941, unused for irrigation because construction of the canal system on the Tucumcari project had to be deferred.

With the end of the war, these projects will be fully developed and many more will be completed as soon as funds, manpower, and materials are obtainable. Altogether, there are 53 projects included in the Bureau's inventory for postwar construction in region 5, which includes all of Texas and Oklahoma, most of New Mexico, the southern half of Kansas and a small area in south-central Colorado. Completion of these projects will make 11,500 irrigated farms available for settlement, irrigate 1,269,000 acres of new land, provide additional water for 991,000 acres inadequately irrigated, and make available tremendous quantities of low-cost hydroelectric power for agricultural use and industrial expansion.

REGION 6

National attention was focused during the year on the Great Plains area of the Missouri River Basin as the Bureau of Reclamation went forward with plans for undertaking after the war the largest and most ambitious development program in the 43-year history of the agency. The Congress gave its endorsement to that program by adoption of the Flood Control Act of 1944 which approved the coordinated plan of the Bureau and the Corps of Engineers, War Department, to put the Missouri and its tributaries to work in expanding the agricultural and industrial economy of a region embracing one-sixth the continental area of the United States.

The act authorized 29 projects for construction by the Bureau and authorized an appropriation of \$200,000,000 to each of the agencies for carrying out the initial phases of the program. The Bureau continued its engineering and economic investigations which have been in progress for the past several years and which culminated last year in the presentation to the Congress of a report (S. Doc. 191, 78th Cong., 2d sess.) setting forth a comprehensive program for resource development in the basin. It is contemplated that this investigation work and the preparation of detailed plans and specifications will be greatly expanded within the next few months with a view to having several projects ready for starting construction by the beginning of the next fiscal year.

To more effectively coordinate its work, the Bureau in September 1944 established a regional office at Billings, Montana, for the area made up of the States of North and South Dakota, most of Montana, and the northern part of Wyoming. This office works closely with the region 7 office at Denver, which serves the remainder of the area drained by the Missouri River and its tributaries.

Bureau-operated projects in region 6 continued their record production of food and fiber crops in helping to meet increased war demands. A total of 342,623 acres were irrigated on the eight operating projects in the region and the crops produced had a gross value of more than

\$14,000,000. This is equivalent to more than 30 percent of the total investment which the government has made in the construction of these projects.

Among the major contributions to the food supply of the Nation were 3,346,000 bushels of cereal grains, 239,000 bushels of hay, flax, pea, and vegetable seeds, 165,000 tons of hay, 1,300,000 bushels of beans, potatoes, and other truck, and 355,000 tons of sugar beets. The inventory value of all livestock on the farms of the eight projects at the close of 1944 was \$17,200,000.

Under the war food program, 14,400 acres have been brought under irrigation on the Buford-Trenton project near Williston, N. Dak., works have been almost completed for 8,000 acres in the Second Division of the Buffalo Rapids project, near Terry, Mont. Though restricted by War Production Board orders and labor shortages construction work was also in progress on the Deerfield Reservoir near Rapid City, S. Dak., a project to furnish supplemental water for irrigated lands in Rapid Valley and a municipal supply for Rapid City. Civilian Public Service camps were furnishing labor on both the Rapid Valley and Buffalo Rapids No. 2 projects.

A contract for the construction of works to irrigate 800 acres on the Intake project near Savage, Mont., was awarded and bids had been received for the Big Flat project of 900 acres near Missoula, Mont. Advertisements for bids on the 1,600-acre Dodson project, near Malta, Mont., were issued but bids had not been opened at the close of the year.

In the power field three operating plants produced a total of 141,783,000 kilowatt-hours, more than 84,000,000 of which were produced at the Fort Peck plant operated by the Corps of Engineers, and marketed through the Bureau of Reclamation.

A 115,000-kilovolt transmission line to carry energy from Fort Peck to Glendive, Mont., was under construction.

At the end of the year there were 43 regional employees in the office at Billings, Mont., and 367 employees in the field working on planning, operation and maintenance, construction and power operation.

REGION 7

With large-scale construction halted or retarded because of the war, major emphasis of the Bureau in this region was placed on continuing high level production of food and electric power and in laying the groundwork for carrying out coordinated plans for Missouri Basin development and completion of trans-mountain diversion projects. Region 7 was established 3 months after the start of the fiscal year as the newest subdivision in the Bureau's program of decentralization, and includes the State of Nebraska, northern half of Kansas, northeastern Wyoming, and western Colorado.

More than \$16,000,000 worth of war-vital crops were produced on the North Platte project (Wyoming-Nebraska), with a full water supply provided for 209,668 acres and a supplemental supply for 96,803 acres. Expanded war industries in the Rocky Mountain area made increased demands for electric power, and four Bureau-operated plants generated 185,000,000 kilowatt-hours of energy, distributed over some 900 miles of transmission lines to industry, cities, and farms.

Construction efforts were concentrated on the Colorado-Big Thompson transmountain water diversion project in northern Colorado and on the Mirage Flats irrigation project in northwestern Nebraska. Work proceeded, despite delays due to manpower and material shortages, on the lining of the 13-mile Alva B. Adams Tunnel beneath the Continental Divide, and on Shadow Mountain Dam near Grand Lake, key features of the Colorado-Big Thompson project.

Completion of the project will provide for the diversion of 310,000 acre-feet of surplus water annually from the western slope of the Rockies, through the Alva B. Adams Tunnel, for supplemental irrigation of 615,000 acres on the eastern slope and the generation of about 600,000,000 kilowatt-hours of electric energy annually. Delivery of 90,000 acre-feet of water annually is scheduled to start in the spring of 1946. Full diversion is expected to increase crop values on the eastern slope by approximately 5 million dollars annually. On the Mirage Flats project in Nebraska, construction of Box Butte Dam on the Niobrara River was about 90 percent complete and work on the irrigation canals and laterals was in an advanced stage. The dam will store water for irrigating 13,000 acres of new land to be opened for settlement by veterans and others.

Investigations were nearly complete on two other major projects proposed for postwar construction in region 7—the Gunnison-Arkansas transmountain diversion project and the Blue River-South Platte project, both in Colorado. With Missouri River waters originating in or flowing through all four states in which it functions, region 7 is also taking an active part in the plans and program for coordinated development of the Missouri Basin.

U. S. RECLAMATION INVESTMENT NEAR BILLION

At the end of the 1945 fiscal year the total investment of the Federal Government in projects constructed by the Bureau of Reclamation amounted to \$952,893,542, an increase of \$31,122,922 over the previous year.

During its 43 years of operation, accretions to the Reclamation fund have totaled \$228,106,850 (see table 4). These have come from the sale of public lands, proceeds from the Oil Leasing Act, from Federal water power licenses, potassium royalties, and rentals

and receipts from naval petroleum reserves from 1920 to 1930 under the act of May 9, 1938. Collections—construction and operation and maintenance repayments, water rentals, power revenues, etc.—have totaled \$173,263,626.

Disbursements during that period have totaled \$358,689,871, leaving a balance in the fund on June 30, 1945, of \$42,680,606. Repayments of construction charges to the Reclamation fund during the fiscal year 1945 totaled \$3,611,000. Operation and maintenance collections totaled \$1,513,000, of which \$442,000 accrued to the Reclamation fund. Receipts from water rentals, power sales, and other sources aggregated \$9,462,000.

TABLE 4.—*Accretions to Reclamation fund by States*

States	Sale of public lands		Proceeds from Oil Leasing Act		Total to June 30, 1945

Total accretions.....	228,106,850.48

NEW LAWS ADVANCE RECLAMATION

Legislation of far-reaching significance to Reclamation was enacted by the Congress during the past year. Most important was the passage of the Flood Control Act of 1944 (58 Stat. 887; Pub. Law 534, 78th Cong.) signed by the President December 22. This act:

1. Approved the coordinated plan of the Bureau of Reclamation and the Corps of Engineers, War Department, for development of the Missouri River Basin as set forth in Senate Documents No. 191 and 247, Seventy-eighth Congress, Second session.

2. Authorized appropriations of \$200,000,000 to each of these agencies for partial accomplishment of the works to be undertaken under the general comprehensive plan.

3. Established the principle that "the use, in connection with the operation and maintenance of such works for navigation herein or hereafter authorized for construction, of waters arising west of the Ninety-seventh meridian shall be subordinate to and shall not adversely affect at any time the beneficial consumptive use, west of the ninety-seventh meridian, of such waters for domestic, irrigation, mining or industrial purposes."

4. Provided that the use of irrigation water stored in reservoirs constructed by the Corps of Engineers, War Department, shall be in accordance with Reclamation Laws.

5. Provided that electric power produced at dams constructed by the Corps of Engineers shall be marketed by the Secretary of the Interior.

6. Provided for review and recommendations by the States and other Federal agencies concerned, of the reports by the Secretary of the Interior and the Secretary of War proposing and recommending construction of projects under the provisions of the act.

Several of the policies set forth in the Flood Control Act of 1944 were subsequently restated by the Congress in passing the River and Harbor Act of March 2, 1945. (Pub. Law 14, 79th Cong., 1st sess.).

This latter bill failed of enactment by the Seventy-eighth Congress due partly to a controversy which arose over an amendment which would have exempted lands in the Bureau's Central Valley project in California from provisions of the law limiting to 160 acres the area that can be held in single ownership on Federal Reclamation projects. This amendment and other controversial issues were stricken from the bill as reintroduced, and passed, by the Seventy-ninth Congress.

Water and power users on Reclamation projects benefited by the amendment on April 19, 1945, of the Fact Finders' Act (Pub. Law 35, 79th Cong., 1st sess.). The Congress by this amendment provided that the cost of administration of the reclamation program, whether incurred by the Commissioner's office in Washington or by regional or branch offices, should not be assessed against water or power users.

Another law passed to benefit farmers on Federal Reclamation projects is the act of April 24, 1945 (Pub. Law 39, 79th Cong., 1st sess.), amending sections 4, 7, and 17 of the Reclamation Project Act of 1939. This act now extends the time within which amendatory contracts may be negotiated and within which the Secretary of the Interior may

grant deferments of construction charges. It also modifies the operation of the normal and percentage plan by putting a ceiling on the amount that can become due in any year through the operation of the plan. Finally, this act now permits minor amendments, without further reference to the Congress in amendatory contracts, which have already been authorized.

The Seventy-ninth Congress also passed an act (Pub. Law 34) consenting to the negotiation by Colorado and Kansas of a compact for the division of the waters of the Arkansas River.

Veteran settlement discussion was focused during this year on a bill (H. R. 520) introduced by Representative John R. Murdock of Arizona. This bill would "facilitate settlement of returning veterans in projects constructed, operated, and maintained by the Bureau of Reclamation." Extensive hearings were held before the House Committee on Irrigation and Reclamation and the bill was reported out by unanimous vote of the Committee with recommendation that it be enacted.

Hearings were also held on Senate bill 555, to establish a Missouri Valley Authority, and the Commissioner and other officials of the Bureau made statements on the bill before the Senate Committee on Commerce.

BUREAU WINS INTERNATIONAL RECOGNITION

The work of the Bureau of Reclamation in developing western resources has won international recognition, and its engineers have been called upon by many foreign governments for technical assistance in the planning and design of projects in other countries.

John Lucian Savage, chief designing engineer for the Bureau, returned to the United States in March from an extended tour of duty in China and the Middle East as engineering consultant to various foreign governments on their plans for postwar irrigation and power developments. In his 34 years of service with the Bureau, Mr. Savage has drawn plans for the construction of more than a billion dollars worth of dams, including the three largest concrete dams ever built—Grand Coulee, Shasta, and Boulder. He went to China at the special request of the Chinese Government, "on loan" from the Bureau to the United States State Department. While there, he made the preliminary surveys and studies for several large reclamation projects, including the huge Yangtze Gorge project for irrigation and flood control. He also spent several months in India. Mr. Savage's engineering achievements have won him many honors and this year he was awarded the John Fritz medal, one of the highest honors of the engineering profession. He retired as chief designing engineer in May but will continue to serve the Bureau in a consulting capacity.

The work of the Bureau has been recognized in many other ways. Another member of its staff, Engineer Douglas McHenry, was awarded the Telford Premium by an engineering group in Great Britain. Design and construction methods used by the Bureau have been made available to many foreign governments through technical papers, by visits of foreign engineers and public officials to Bureau projects and offices and through facilities of the Bureau training program. During the year, 38 engineers from 15 foreign countries visited the design and construction offices and several of the men remained for training. Arrangements were made during the year to train foreign engineers under the sponsorship of the Foreign Economic Administration. Nineteen engineers from China began their training with the Bureau during the summer of 1945.

The Bureau's Concrete Manual has become a recognized text on concrete. Its distribution is world-wide and two foreign countries have translated it. The manual on dams, preparation of which was begun during the fiscal year, will be a comprehensive compilation of data on dam investigation, design, construction, and operation.

DECENTRALIZED ORGANIZATION

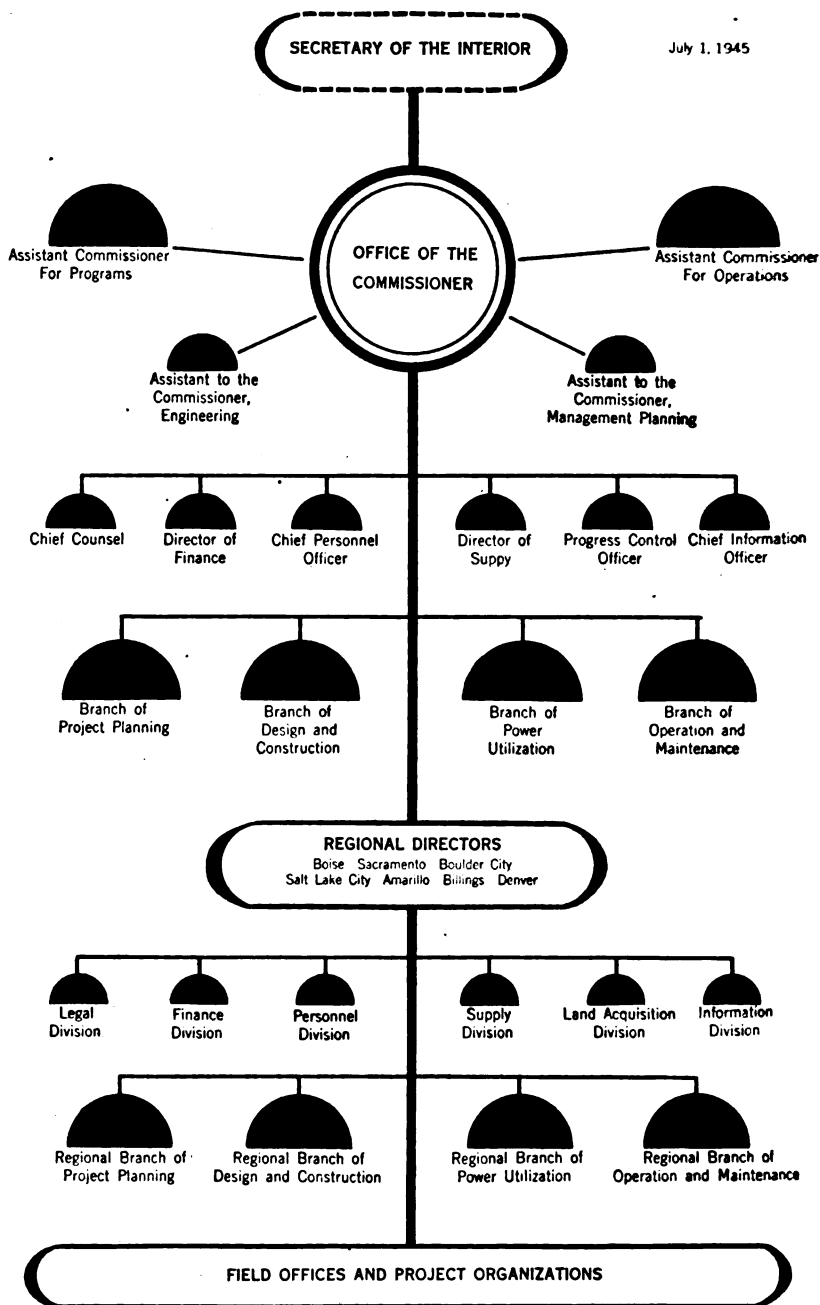

The Bureau of Reclamation, following through on a decentralization plan inaugurated in September 1943, created a seventh regional office during the fiscal year and further developed and strengthened existing staffs to expedite both war and postwar objectives.

The basic concept for streamlining the Bureau has been the establishment of competent regional organizations in each of the seven major watersheds in the 17 Western States with authority to act swiftly and surely in close collaboration with States, local interests, and other affected Government agencies.

The seven regional offices are as follows: Region 1, Boise, Idaho; region 2, Sacramento, Calif.; region 3, Boulder City, Nev.; region 4, Salt Lake City, Utah; region 5, Amarillo, Tex.; region 6, Billings, Mont., and region 7, Denver, Colo.

The regional directors who are responsible for coordinating all Bureau activities within their regions, report directly to the Commissioner of Reclamation. They are assisted in technical phases of their work by four technical branches, namely, Project Planning, Design and Construction, Operation and Maintenance, and Power Utilization, and by administrative facilities in the fields of management, law, finance, public information, supply, personnel, and office services, which are also centrally directed.

BUREAU OF RECLAMATION

The Branch of Operation and Maintenance was transferred from Denver to Washington during the fiscal year. In addition plans were made to transfer the Branch of Project Planning and the central budget function to Washington early in the fiscal year 1946.

The chart indicates the present organizational arrangement of the Bureau under the decentralization plan.

The number of Reclamation employees increased from 6,513 on June 30, 1944, to 7,033 on June 30, 1945. Further increases in the Bureau staff, greatly depleted by the war, will be required to accomplish authorized postwar programs. A total of 1,806 employees of the agency have entered the armed forces of the United States; so far, 30 have given their lives and 4 are missing.

The number of persons employed in the various Bureau activities are: Commissioner's office, 141; Branch office, Denver, 837; region 1, 1,773; region 2, 764; region 3, 1,175; region 4, 302; region 5, 1,009; region 6, 410; and region 7, 622. Ten new project and other field offices, exclusive of headquarters for project planning work, were established during the year.

PERSONNEL CHANGES

The past year has been marked by several changes in the Bureau's top-ranking personnel. Notable among these was the retirement after 34 years of Bureau service of John L. Savage, chief designing engineer, who has won world renown for his work on Grand Coulee, Shasta, Boulder, and many other dams in this country, in addition to serving as an adviser to foreign governments.

Another important change in the Denver office was the appointment of Walker R. Young, assistant chief engineer since 1940, to succeed S. O. Harper, who retired after 37 years in Reclamation. Three assistant chief engineers were appointed as follows: Chief of Civil Engineering Division, W. H. Nalder; Chief of the Electrical and Mechanical Division, L. N. McClellan; and Chief of the Construction Division, Ralph Lowry.

E. B. Debler, Director of the Branch of Project Planning, was appointed Director of the newly created region 7 with headquarters in Denver. John R. Riter, assistant Director of project planning, moved up to the position as Director of that Branch.

Goodrich W. Lineweaver, assistant to the Commissioner, was appointed Director of the reorganized Branch of Operation and Maintenance. Clifford E. Fix replaced J. Kennard Cheadle as Chief Counsel when the latter resigned to enter private practice. Barrow Lyons became Chief Information Officer.

TABLE 5.—Consolidated statement by projects of construction cost of irrigation works, other items reimbursable with construction, and deductions

State and project	Construction cost		Operation and maintenance before public notice (net)		Operation and maintenance deficits, arrears, and penalties		Construction revenues, non-reimbursable appropriations (contra)		Abandoned works, non-reimbursable cost and authorized charge-offs	Balance	
	Fiscal year 1945	To June 30, 1945	Fiscal year 1945	To June 30, 1945	Fiscal year 1945	To June 30, 1945	Fiscal year 1945	To June 30, 1945		Fiscal year 1945	To June 30, 1945
<i>Regular projects</i>											
Total.....	\$22,483,044.71	\$535,232,327.19	\$53,830.64	\$3,455,365.53	\$149,472.77	\$9,223,308.67	\$570,613.15	\$17,754,302.14	\$17,127.29	\$21,520,858.20	\$513,026,571.96

Total.....	6,790,365.65	409,145,854.94									
Grand total.....	31,122,922.43	952,893,542.14									

• Net construction cost.

• Construction revenues.

• Operation and maintenance during construction.

Division of Power

ARTHUR GOLDSCHMIDT, *Director*

THE work of the Division of Power, which is charged with supervising and coordinating the power activities of the Department, continued along lines dictated by the marketing problems resulting from war operations, as well as by concern for postwar conversion and expansion.

The responsibilities of the Division have been greatly enlarged by the enactment of the Omnibus Flood Control and Rivers and Harbors Acts which direct the Secretary of the Interior to transmit and market all excess power generated at reservoir projects constructed by the War Department, in such manner as to encourage the most widespread use of the power at the lowest possible rates to consumers consistent with sound business principles, and to give preference in its sale to public bodies and cooperatives. In this legislation the Congress reiterated the public power policy which it has developed during the past 40 years in the Reclamation, the Tennessee Valley Authority, the Rural Electrification, the Bonneville, the Fort Peck, and other acts dealing with power. Fundamentally that policy directs that the benefits of Federal power developments shall not be monopolized by limited groups, but shall be widely distributed so that the power shall develop the industry and agriculture of the Nation, and lighten the burden of the domestic consumer.

The ultimate installed capacity of the authorized flood control projects is more than 5,775,000 kilowatts, and of the authorized rivers and harbors projects is over 1,425,000 kilowatts, or a total of more than 7,200,000 kilowatts.

The Department of the Interior is now operating and marketing power from the largest aggregate of hydroelectric capacity in the world, including power which is generated at dams operated by the United States Army Corps of Engineers.

The total investment in power facilities at projects from which the Department markets the power, including parts of dams and reservoirs allocated to power, aggregated nearly \$425,000,000 on June 30, 1944, on the basis of tentative power investment figures for those projects where the allocation studies have not been completed.

This figure also includes the Grand River Dam project which is owned by the Grand River Dam Authority of the State of Oklahoma but which since September 1, 1943, has been operated by the Department.

The generating plants from which the Department now markets power delivered 18 billion kilowatt-hours of salable energy during the 1945 fiscal year as compared with 17.6 billion kilowatt-hours the preceding fiscal year. In 1940 all of the power plants under the jurisdiction of the Department produced 3,672,995,000 kilowatt-hours. As of June 30, 1945, the total installed capacity of such plants in operation amounts to 3,107,300 kilowatts. During the 1945 fiscal year the three major power agencies of the Department, the Bonneville Power Administration, the Bureau of Reclamation, and the Southwestern Power Administration generated 17,820,000,000 kilowatt hours of which 17,300,000,000 kilowatt-hours were sold for a gross revenue of \$45,500,000.

Fortunately, hydroelectric power is not a "nonrecurring" assets. To be sure, the billions of kilowatt-hours that have gone to war in the past year are not available for nonwar or for future peacetime uses. But the power facilities and the river resources through which they were developed are long-run assets for the people of the United States to use in their national defense or in the general welfare. Against the 7,300,000,000 kilowatt-hours that were used for war purposes from the Columbia River projects, for instance, must be measured the untold millions of kilowatt-hours that were not developed during the year at proposed projects on that river system that have been authorized or studied. Unused resources, throughout the country, represent "frozen" assets that must be made useful by development. To that end the congressional authorization in the Flood Control and Rivers and Harbors Acts and the comprehensive development program of the Bureau of Reclamation will provide for a realization of a large portion of our unused hydro energy resources. But these vast new power resources must be sold and to accomplish this task efficiently studies by the power selling agencies of the Department are now under way in collaboration with other Federal agencies and with State and municipal organization. The successful efforts to develop and use the tremendous supply of public power for war activities, must, with the coming of VE-day and the anticipation of VJ-day, be matched by achievement of appropriate reconversion programs and load building activities in order to provide for the period of transition from a wartime basis to a peacetime economy without avoidable wastage of this natural resource.

The Division has also been working with the war agencies on the problem of disposition of fuel-operated generating plants that have

been built to serve some of our large military establishments and war plants. Acquisition by the Federal power agencies of those plants which will not be needed for defense purposes after the emergency, as a means of supplementing and firming the hydroelectric power which is now generated or will be generated by the proposed Federal plants, has been under study. Such coordination of Government facilities will result in better operations in areas of irregular stream flow, and consequently in sounder financial arrangements, lower rates, and greater regional benefits. In some instances such fuel-operated plants can provide needed peaking or standby power which is now being purchased by the Government.

Regional studies.—The Division has continued its participation in studies being conducted by the agencies of the Department in efforts to work out the pattern for the administration and the extension of the multipurpose developments in the various river basins throughout the country, such as the Sacramento and San Joaquin Rivers, the Columbia River, the Missouri River, the Arkansas River, the Colorado River, and the rivers in the Southeastern section of the United States. These studies are necessary to determine the best method for making available to the people of the various areas the maximum benefits of the multipurpose projects at a minimum cost. These studies include the use of power for war production, the scheduling of construction features, the reconversion of war plants in the areas, the extension of these projects to provide additional postwar opportunities, the allocation of costs, and the power policies to be effectuated.

Rates and rate schedules.—No reductions were made in the various wholesale rates of the Department during the year, but substantial reductions were made by purchasers of low-cost Department power for resale as required under their purchase contracts. Private power companies making such reductions include the Montana-Dakota Utilities Co., serving eastern Montana and western North Dakota, with a reduction of over \$200,000 per annum; the Mountain States Power Co., serving northwestern Wyoming, with a reduction of over \$25,000 per annum; The Texas Power & Light Co., serving northern and eastern Texas, with a reduction of approximately \$400,000 per annum, which includes a 10 percent reduction to Federal war loads; and the Arkansas Power & Light Co., serving much of the State of Arkansas.

Thirty-seven REA-financed projects are being supplied with power at rates ranging down to about 3 mills a kilowatt-hour. Owing to the inability to obtain materials because of war-time restrictions, no increase was made within the year in the number of Rural Electrification Administration financed projects served by the power agencies within the Department.

The Division reviewed during the year several major rate studies including the interim rate for the Central Valley project in California and the rate structure of the Bonneville Power Administration in the Pacific Northwest. In connection with the latter study which is still under consideration are proposed rates for the electrification of the railroads and the generation of steam by the use of secondary electrical energy.

Contracts.—Further efforts to decentralize the administration of power matters, while achieving maximum uniformity, has resulted in the establishment of standard contract provisions for Bureau of Reclamation projects.

Miscellaneous.—The Division participated in the negotiations for the disposal of the Hetch Hetchy power by the city of San Francisco in accordance with the terms of the Raker Act. The injunction against the sale of this power to the Pacific Gas & Electric Co. has been put into effect as a result of arrangements made by the city to use its power for its own municipal purposes and to sell power directly to two irrigation districts and to industrial war plants in the area.

The Division cooperated in studies and negotiations of the Bureau of Reclamation for the proposed acquisition of power facilities of Salt River Water Users' Association in Arizona and of the Minidoka and Burley power facilities in Idaho in an effort to bring about unified operating systems and to make possible lower rates. The Division also cooperated in the study of the financial feasibility of proposed power projects of the Bureau of Reclamation prior to authorization and in the handling of the power contracts of the Defense Plant Corporation for Boulder Dam power.

The Division was also able to render service to the Puerto Rico Water Resources Authority in connection with its priorities problems in the construction of the Caonillas Dam and transmission facilities which are necessary in the supplying of power to Army and Navy bases in Puerto Rico. Assistance was also given to the Territorial Government of the Virgin Islands in connection with the studies of critically needed AC generating and distributing systems for the towns of Charlotte Amalie, St. Thomas, and Christiansted and Fredericksted, St. Croix.

Bonneville Power Administration

PAUL J. RAVEN, *Administrator*

THE FOURTH WAR YEAR

BY June 30, 1945, the power of the Columbia River, harnessed by the two great Federal projects, Bonneville and Grand Coulee Dams, and marketed by the Bonneville Power Administration, had played a major role in the production of several billion dollars worth of ships, planes, light metals, chemicals, and other war supplies.

During the 3½ years since the United States entered the war on December 7, 1941, the Administration has delivered a total of 17.5 billion kilowatt-hours to war industries and military establishments. Revenues from the sale of this power for war purposes aggregated \$43,216,192 to June 30, 1945.

War loads continued to consume a major share of the Administration's total power deliveries during the 1945 fiscal year. Of 8.5 billion kilowatt-hours sold during that 12-month period, the Pacific Northwest's five aluminum reduction plants and one aluminum rolling mill took 4.6 billion kilowatt-hours. Although minor cut-backs in Northwest aluminum production occurred early in 1944 and more serious cut-backs threatened, the Nation's continuing high level of aircraft production made it necessary to revise estimates of aluminum requirements, and by the summer of 1945 all of the Northwest plants had been requested to increase production to capacity. In fiscal year 1945, as in 1944, the Northwest plants produced more than one-third of the Nation's entire aluminum output. Aluminum produced with Columbia River power contributed greatly toward the establishment of United States air supremacy in the European and Pacific battle areas. The 503,144,000 pounds of aluminum produced by Northwest plants in this 12-month period was sufficient to produce 10,000 B-29s or 150,000 fighter planes.

Of even greater importance to final victory in World War II was the contribution made by Bonneville-Grand Coulee power to the development of the atomic bomb. The location of the Hanford Engineer Works in the Pacific Northwest was determined to a con-

Bonneville Power Administration

PAUL J. RAYER, *Administrator*

THE FOURTH WAR YEAR

BY June 30, 1945, the power of the Columbia River, harnessed by the two great Federal projects, Bonneville and Grand Coulee Dams, and marketed by the Bonneville Power Administration, had played a major role in the production of several billion dollars worth of ships, planes, light metals, chemicals, and other war supplies.

During the 3½ years since the United States entered the war on December 7, 1941, the Administration has delivered a total of 17.5 billion kilowatt-hours to war industries and military establishments. Revenues from the sale of this power for war purposes aggregated \$43,216,192 to June 30, 1945.

War loads continued to consume a major share of the Administration's total power deliveries during the 1945 fiscal year. Of 8.5 billion kilowatt-hours sold during that 12-month period, the Pacific Northwest's five aluminum reduction plants and one aluminum rolling mill took 4.6 billion kilowatt-hours. Although minor cut-backs in Northwest aluminum production occurred early in 1944 and more serious cut-backs threatened, the Nation's continuing high level of aircraft production made it necessary to revise estimates of aluminum requirements, and by the summer of 1945 all of the Northwest plants had been requested to increase production to capacity. In fiscal year 1945, as in 1944, the Northwest plants produced more than one-third of the Nation's entire aluminum output. Aluminum produced with Columbia River power contributed greatly toward the establishment of United States air supremacy in the European and Pacific battle areas. The 503,144,000 pounds of aluminum produced by Northwest plants in this 12-month period was sufficient to produce 10,000 B-29s or 150,000 fighter planes.

Of even greater importance to final victory in World War II was the contribution made by Bonneville-Grand Coulee power to the development of the atomic bomb. The location of the Hanford Engineer Works in the Pacific Northwest was determined to a con-

siderable extent by the availability of large quantities of hydroelectric power and water from the Columbia River.

Working closely with representatives of the United States Army and the Hanford project, engineers of the Bonneville Power Administration conducted studies to determine: (a) The most reliable location on the Bonneville Power Administration system for the important Hanford load, (b) what system circuits and connections would be necessary so that the Bonneville generators could pick up and carry this load in case of trouble at the Coulee powerhouse, (c) how the remainder of the Bonneville system could be disconnected from the Hanford load to permit the Bonneville powerhouse or the Coulee powerhouse generators to continue carrying the Hanford load in case of major disturbances on the Bonneville system.

As a result of these studies, the Bonneville Power Administration was able to provide large quantities of power to the Hanford project with the highest possible degree of reliability, a prime requisite to successful production of the atomic bomb.

Other war materials produced during the past year in plants using Bonneville-Grand Coulee power included 181 ships—54 Victory cargo ships, 62 troopships, 63 tankers and 2 aircraft carriers—and large quantities of calcium carbide, ferroalloys; chemicals and explosives.

While the Bonneville Power Administration continued its home front job of delivering power for war, 1,050 employees on military furlough with the nation's armed forces were scattered over fighting fronts throughout the world.

CURRENT OPERATIONS

Kilowatt-hour sales of the Bonneville Power Administration for fiscal year 1945 totaled 8,502,000,000 compared with 8,671,000,000 the preceding year. Despite the slight drop in kilowatt-hours, revenues increased 10 percent from \$20,896,000 to \$22,990,000 after deduction of a \$438,560 reserve for contract and bill adjustments. This situation arises from the fact that the revenues are power billings which are based upon capacity contracted for, rather than upon energy delivered as regards the bulk of the Administration's service. For the period from the commencement of operation to June 30, 1945, earnings from power sales have aggregated \$63,626,000.

INDUSTRIAL AND RESOURCES DEVELOPMENT

As World War II drew to a close in 1945, the Bonneville Power Administration began to focus attention more sharply on the problem of developing peacetime power markets to utilize surplus power becoming available as Pacific Northwest war plants curtailed operations or closed.

Analysis of the Administration's war loads indicates that a maximum of 600,000 kilowatts, or approximately 50 percent of our total capacity may become available for remarketing.

Confronted with this possibility, the Administration is devoting considerable effort to the formulation of an extensive program of market and system development designed to provide markets for surplus power as quickly as possible, and to assist in retaining the Pacific Northwest's wartime industrial gains. The marketing program is directed toward the development of new power markets in industries that will directly or indirectly provide jobs for returning service men and displaced war workers.

REPORTS

As a part of this program, the Division of Industrial and Resources Development completed a number of reports during fiscal year 1945, based on continuing studies of Pacific Northwest resources and potential power markets.

A particularly valuable report issued during fiscal 1945 was one entitled "A Preliminary Report on the Plastics Industry as Related to Pacific Northwest Industry." This report originally had been prepared for limited distribution to technical and industrial interests. The response from industry, however, was so overwhelming that a new printing was ordered.

A new supplemental report on the same subject is now in course of preparation. It deals in specific terms with cellulose-base plastics, for the manufacture of which a great potential exists in the Pacific Northwest.

Economic surveys under the general title "Economic Base for Power Markets" were issued for the following counties: Clatsop County, Oreg., and Cowlitz, Walla Walla, and Thurston Counties in Washington. Similar surveys which were under preparation during the year and are scheduled for early release include Lane, Lincoln, and Benton Counties in Oregon; Flathead, Lake, and Sanders Counties in Montana. In Washington State, studies were under way for Chelan, Douglas, Okanogan, Clallam-Jefferson, Franklin, Benton, Skagit, Mason, Grays Harbor, Stevens, Ferry, and Pend Oreille Counties.

Reports for use within the Administration included one entitled "A Preliminary Study of Railroad Electrification in the Pacific Northwest." In brief, this study revealed the following points:

(1) In a region of great hydroelectric abundance, it seems undesirable from the standpoint of national interest to allow a continuously replaceable form of energy to remain unused while remaining irreplaceable reserves of petroleum and coal are further depleted.

(2) The development and utilization of railroad motive power is at a critical juncture, with newer forms of prime movers rapidly appear-

ing to claim the place long occupied by the old familiar reciprocating steam locomotive.

(3) The Diesel-electric locomotive, which thus far has been and gives promise of continuing to be the most likely replacement for the steam locomotive, is not a completely satisfactory answer. Neither physically nor economically does the Diesel solve all the problems which are posed by the retirement of the steam locomotive. So far as yard switching service goes, the Diesel is granted to have proved its case, and not even the most ardent advocates of electrification suggest any deviation from the trend toward their full replacement of steam units in yard and industrial trackage assignments.

(4) For main-line purposes, the problems are entirely different. Here a strong case, and it is believed an ultimately compelling one, can be made for the straight-electric locomotive.

(5) Physically, the straight-electric locomotive compares favorably with the Diesel-electric. Actually, they are both electric locomotives so far as the method by which torque is supplied to drive wheels is concerned. Where they differ is that one is supplied with electricity generated on the locomotive by a severely limited mechanism of prime mover, generator, etc., which must also carry its own fuel supply as dead weight and which has no overload capacity whatsoever, while the other can be supplied from a trolley system with an almost limitless capacity of hydroelectric central stations.

The Bonneville Power Administration, realizing that there was relatively little likelihood of adding to electrified trackage during the war, has directed its inquiries toward an appraisal of the postwar possibilities. Action has been sought on a power rate schedule that would be conducive to the consideration of electrification, and serious thought has been given to the best and most economically feasible method of bringing service from the Administration's facilities to a railroad's trolley systems. This has involved some attention to the problem of standardization of railway electrification systems which have in the past involved too many variations to lend themselves either to the most economic manufacture or operation. Studies will be continued particularly on these two subjects during the ensuing year.

Numerous other technical reports were prepared, including one on the effects of new industrial developments on tax revenues in the Pacific Northwest, and one entitled "A Review Study of the Columbia Basin" for the use of the Bureau of Reclamation. A third report dealt with shipments through the locks of Bonneville Dam. An exhaustive report was also made on the zinc lead mines of the Pacific Northwest and tributary areas.

INDUSTRIAL CONTACT ACTIVITIES

In carrying out the Bonneville Power Administration's industrial research and development programs, contacts have been made with leading industrialists and businessmen throughout the country.

Through these contacts valuable information on the Northwest's resources and market potentialities has been made available to industries in all sections of the country, many of which are looking to the Pacific coast as the last industrial frontier.

Bonneville's industrial contact program has been directed to a large extent toward the fields of electronics, electro-process industries and other industries in which low-cost power is an important element.

The region's tremendous hydroelectric power resources coupled with its rich forest, agricultural and mineral resources furnish a sound basis for the belief that the Pacific Northwest corner of the United States will play an important role in the development of new electronic, chemical, and metallurgical industries based on important discoveries made in these fields during the war.

Specific products which Bonneville research indicates can be produced in the Northwest include: phosphorus, manganese bronze, glass containers and glass blocks, sulfuric acid, industrial alcohol, electrolytic iron and other powdered metals, electrolytic zinc, rayon, pigments, dichromate salts for ink, electrolytic manganese, fertilizers, chlorine and acetylene products, tars and phenols, coal and by-products, limestone, plastic metals, lithium and other rare metals, ferro-alloys, silica sands, battery lead, and litharge.

All of these products have been discussed with industrial representatives, and it is expected that a number of new Northwest plants will be constructed in the near future as a result of these contacts.

Bonneville's industrial contact activities have been instrumental in initiating action on a number of plants already under construction or completed, including the Springfield alcohol plant near Eugene, Oreg., the alcohol plant at Bellingham, Wash., in which use is made of sulfide liquor wastes from the pulp mill in that locality. In the promotion of both of these ventures, the Bonneville Power Administration played a pioneering part.

Development of the Salem, Oreg., alumina plant was encouraged and its promotion maintained by the Bonneville Power Administration in cooperation with regional interests. Of particular interest are the electric boilers in the plant, an innovation for which Bonneville Power Administration had primary responsibility.

In electrolytic iron, the Administration stimulated the interest of three major companies, one of which is now proceeding with the selection of sites and expects to begin plant construction in the near

future. The Administration is continuing its activities in the field of powdered metallurgy now gaining in practical importance, particularly in the automotive industry. The Bonneville Power Administration also continued to stimulate interest in electrolytic manganese.

The availability of titanium-bearing sands caused the Administration actively to stimulate research in the utilization of the titanium fractions for the use of pigments. Much interest is developing in the industrial potentialities of this resource.

An important plant for the manufacture of resinous plastics for the plywood industry has been established by one of the key companies in this field. Continuous contact and release of the "Preliminary Report on the Plastics Industry" by the Administration had a direct bearing on the establishment of this plant.

Activity and interest in the production of rare metals such as lithium have been followed closely by the Administration and continuous contact with one of the major producers of rare metals indicates the possible establishment of a large plant in this region.

Culminating 8 years of effort on the part of the Administration in the utilization of electric power for the manufacture of glass was the establishment of a sizable glass-producing unit in a Northwest glass plant utilizing the so-called Cornelius electric glass furnace. The success of the operation will bear definitely on the use of this type of furnace elsewhere in the Pacific Northwest in the coming expansion of glass-producing industries.

Also as part of the interest in chemical industries, renewed activity has taken place in the mining of limestone and silicas. These two materials are the basis for any chemical industries which might develop in the Pacific Northwest.

INDUSTRIAL STUDIES

The industrial contact work indicated above requires careful advance as well as continuing industrial and market analysis. In this respect, studies on limestone and silica and on lead and zinc were prosecuted by members of the staff, together with a multitude of short-run studies required for direct industrial contacts.

The Administration continued with collaborative studies on a wood-utilization experimental pilot plant for the production of charcoal. It also collaborated in basic research work on the utilization of titanium-bearing sands for the production of pigments.

In order to lay a sound basis for market analysis, the Administration began a long-range study of interregional and intraregional freight rates as well as of specific markets for specific power-using industries. Utilization of local coals for the production of charcoal, phenol, and tars was the subject of much contact work. Discussions with leaders of industry and with Government officials on a comprehensive study

of fertilizer use and potential production in the Pacific Northwest have also been carried on in the past fiscal year. Also initiated was a long-range study of railroad electrification, with numerous collaborating contacts with the TVA, Bureau of Reclamation, and various railroads and manufacturers of equipment.

An attempt to stimulate interest in the manufacture of line hardware by local manufacturing enterprise was launched during the year, with interesting initial results.

A long-range program in the use of aluminum and its fabrication in the Pacific Northwest was initiated by the staff. The cooperative relationship of the Administration with the Office of Alien Property Custodian was continued, with many direct contacts made by the Alien Property Custodian representative.

COOPERATION WITH OTHER AGENCIES

Staff members prepared testimony and participated in hearings before the United States Senate Special Committee to Study and Survey Problems of Small Business. Particular emphasis was given to problems relating to the disposal of Government facilities in the production of aluminum and in general problems of business and industrial expansion in the Pacific Northwest States. Another committee with which the Administration collaborated was the United States Senate Committee on Centralization of Industry. Numerous conferences were held with State officials on matters relating to industrial and resource development and initial conferences were held in the four Pacific Northwest States with staff members of higher educational institutions for the purpose of developing cooperative programs of research in industry and resource utilization.

THE LIGHT METALS INDUSTRY

Much effort was put forth by the Bonneville Power Administration during the fiscal year 1945 in studying problems of industrial and peacetime operation of Government-owned light metal plants in the Pacific Northwest. Declaring it to be a primary objective of the Bonneville Power Administration to assist in the utilization of Northwest resources for the development of a well-rounded industrial economy to provide maximum employment, Administrator Paul J. Raver, in testifying before the Murray Small Business Committee, maintained that the aluminum industry can and should be a major part of that development. The following recommendations to be undertaken immediately by Government agencies to assist new operators to take over the Government-owned aluminum plants and operate them successfully were made at that time. In substance, they are:

1. In order to prevent immediate shutdown of the major part of the aluminum capacity because of a shortage of war orders, minimum

markets above immediate normal needs should be provided by Government stock-piling of aluminum ingot as a national defense measure.

2. The Government should control all surpluses of virgin and so-called secondary metal, releasing them gradually so as not to interfere with an orderly change of price levels.

3. Government should provide new operators with access to high grade, imported bauxite to insure an adequate and reliable source of raw material.

4. Government agencies should coordinate and increase efforts in the direction of assisting private enterprise to appraise both export and domestic use of light metals. The question of freight rates is basic to the aluminum marketing problem, and the Bonneville Power Administration has started studies of freight rates on electro-industry products.

5. In order to help overcome problems of improper location, fractional capacity operation and reopening of shut-down plants, the Government should provide engineering assistance in appraising production costs, grant flexible terms of lease and assume the costs of plant alterations and, where necessary, finance relocation of improperly located plants or their equipment. So far as power rates are involved in this problem, the Bonneville Power Administration has pointed out its obligation to pay for the cost of the power projects out of revenues as provided by Congress in the Bonneville Act.

UTILIZATION ACTIVITIES

Intensive efforts have been devoted throughout the year to investigation and study of electric house-heating systems, particularly installations in service for a season or more. It is immediately apparent from public interest shown in this method of home heating that a large potential market for power exists in this field. As a result of the findings of the Administration's utilization engineers in the field, many of the adverse attitudes heretofore caused by lack of knowledge of energy demands and of the cost of the electric space heating, have been dissipated.

These investigations have included extensive measurements and tests on existing heating installations to determine results and costs of this type of heating. Although a great deal of data have been accumulated, much work remains to be done in this field, particularly because of continuing new developments in electric heating methods.

In the fields of rural and agricultural utilization, considerable investigation has been made into improved methods of hay drying, fruit dehydration, sprinkler irrigation, scientific dairying, and food preservation by means of electric processes.

COOPERATIVE RESEARCH PROJECTS

As a part of the program for developing use of power in the Pacific Northwest, particularly for farm use and electric house heating, a program of cooperative research with colleges and universities in the Northwest was initiated by the Administration during fiscal year 1945.

Funds utilized for this research program were those provided by the Congress for advanced marketing activities. Agreements were executed during the fiscal year with Oregon State College, Washington State College, Montana State College, the University of Washington, and Linfield College. With each, a basic memorandum of understanding has been executed outlining the relationships between the institution and the Bonneville Power Administration and forming the basis for specific agreements regarding individual research projects.

With Oregon State College, under a basic memorandum dated May 22, 1945, eight separate studies are to be undertaken. These will include studies on (1) pipe and pipe materials for use with sprinkler irrigation, (2) dairy water heating, (3) home built farm refrigeration units, (4) electric radiant panel heating, (5) reversed cycle heating (6) electric heat storage and its economic aspects, (7) biochemical analysis dealing with preservation of forage crops, and (8) livestock feeding experiments in connection with cured hay.

Five studies will be made by Washington State College under a basic memorandum dated June 12, 1945. These will include studies on (1) cranberry drying equipment, (2) refrigeration for family use, (3) corrosion characteristics of metal pipe used in sprinkler irrigation installations, (4) low-pressure sprinkler investigation, and (5) use of electric welders on the farm and their effect on rural lines.

Under a basic memorandum dated June 23, 1945, the University of Washington will pursue the following studies: (1) Possible improvements or changes in a design of distribution systems resulting in a lower cost of distribution, (2) domestic house-heating installations in and near the city of Seattle, and (3) economics of the heat-pump method for domestic heating.

Montana State College, under a basic memorandum dated June 11, 1945, will make a survey of opportunities for small irrigation pumping plants in western Montana.

Linfield College at McMinnville, Oreg., under a basic memorandum dated June 13, 1945, will prepare a critical survey of the present art of water treatment by ozone and other technological uses of ozone.

The total maximum obligation for all of the studies to be undertaken will amount to \$63,528.

Work was started on certain of these projects during the month of June, and in other projects initial activities will not be undertaken until late in 1945. The period for completion will generally extend

into late 1946 or early 1947 although in a few instances completion by June 30, 1946, was planned.

Approximately \$20,000 has been obligated for studies relative to electric heating. Oregon State College, which has an excellent heating research laboratory, is undertaking to make experimental studies in radiant panel heating, heat storage systems and reversed cycle heating, all with electric energy as the heating medium. Radiant panel heating is perhaps the newest form of heating developed and promises to have considerable future development both because of the inherent advantages of this type of heat and because it appears to be peculiarly well adapted to conversion of existing dwellings from fuel heat to electric heat. Many problems in application of radiant panels are yet unsolved, in part relating to the characteristics of panels of different types, the method of application of panels, and the relative efficiency of panel heating.

Electric heat-storage systems have been in existence for many years and were designed originally in order to control the time of occurrence of the electrical heating load so as to prevent this from coinciding with other loads. With the development of electric heating which will probably occur, it is not likely that this "off-peak" feature will have much practical advantage, but heat-storage systems will enable the maintenance of a constant demand at all times on the electrical system to supply fluctuating heating demands. This characteristic is of great value to electrical distributors. It is hoped by the experiments at Oregon State College that it will be possible to determine the most efficient of the various types of heat storage systems now available and to simplify the designs so as to reduce the cost of installation which now is fairly heavy.

The characteristics of reversed cycle heating or the heat pump are now fairly well known, but application of this method of heating under actual operating conditions, as would be experienced in the climate of this area, are relatively unknown. Experimentation at Oregon State College will uncover the operating problems which are likely to occur and will make possible determination of the technical feasibility of this method of heating. Since the heat pump returns approximately three times as much energy in heat as is required in electricity for operation, a low-cost and practical development of this equipment would enable very rapid expansion of the electric-heating market. The University of Washington's studies in the economics of the heat pump will provide the answer to the present questions of using the equipment under conditions as they exist in the area and will also point the way to determining what reductions in costs or changes in technique are necessary to make the heat pump a practical instrument of heating.

The University of Washington will study the characteristics of existing heating installations in the Seattle area, which include a considerable variety in heating methods, such as radiant panel, heat storage, and radiant-convection. Analysis of the load characteristics and operating results will help to answer questions which occur in the minds of power distributors and ultimate consumers.

One of the major problems connected with electrical heating is the development of economical methods of distributing electricity to serve the large loads which are imposed by this use. The University of Washington will analyze the problem of the most efficient distribution methods for this type of load and the results of their studies will help in solving many problems involved.

Sprinkler irrigation is a subject of great interest to farmers in the Northwest and to the Bonneville Power Administration as a marketer of power. This method of irrigation holds many advantages for the farmers and also uses large quantities of power. Three research projects are planned to study various phases of sprinkler irrigation. Washington State College will study the corrosion characteristics of various types of metal pipe used in sprinkler-irrigation installations in order to determine relative durability of various types and the soil and water conditions to which each is best adapted. This college will also analyze various other problems involved in sprinkler-irrigation systems such as the soil and crop conditions necessary, types of sprinkler heads and other problems. Oregon State College will study pipes and pipe materials for use with sprinkler irrigation under conditions in the State of Oregon to determine which types are best adapted for furthering the efficient use of sprinkler irrigation.

Montana State College will analyze the opportunities for establishment of small irrigation-pumping units in western Montana. The detailed survey of the area which is planned will reveal the possibilities of developing irrigation projects and the conditions which must be overcome to obtain this development.

Use of electricity on the farm for operation of refrigerating units for preservation of meats, vegetables, and other farm produce promises to be a very large market for electricity in the future. It is of the utmost importance that farm refrigeration equipment be developed which will perform the job efficiently and will be relatively low in cost. Both Oregon State and Washington State Colleges have been interested in the development of farm refrigerators for many years, and each is conducting a research project on this subject with funds made available by the Bonneville Power Administration.

The interest of farmers has been much attracted in the past few years by the possibilities of improving the quantity of usable hay harvested by the use of electrically operated blowers for drying hay

in the hay mow. This practice is of particular importance in areas where there is considerable rain during hay harvesting periods. One angle which has not been sufficiently investigated to obtain reliable data is that of the nutritional qualities of barn-dried hay. It has been claimed that these are superior but this claim was not based on very thorough scientific research. Accordingly, Oregon State College proposes to expand its research program in hay drying to include investigations of the biochemical analysis of barn-dried hay in comparison with ordinary hay. They will also conduct livestock feeding experiments to throw light on the nutritional quality of barn-cured hay.

Washington State College will conduct a study of the use of electric welders on the farm which will indicate the operational characteristics of this equipment and the improvements which should be made to better adapt it to the needs of the farmers and to meet the limitations of electric power lines. This college will also conduct experiments in the development of electrically powered cranberry dryers which will make possible more efficient practices in the harvesting and marketing of cranberries.

POWER SALES

During fiscal year 1945 approximately 86 percent of all energy generated at the Bonneville-Grand Coulee plants was delivered either directly to war industries and military establishments or to other utilities to enable them to serve such loads. The proportion of total deliveries going to war loads is beginning a downward trend from the 90 percent for the 1942-43 fiscal year and 89 percent for the 1943-44 fiscal year.

The Bonneville Power Administration delivered 8½ billion kilowatt-hours of electric energy to 80 customers during this last year. Of this total, 824 million went to publicly owned utilities, 2,057 million to privately owned utilities and 5,632 million to industries and military establishments. As compared with the previous year, deliveries to other utilities increased 13 percent for publicly owned utilities and 40 percent for privately owned utilities; deliveries to industries and military establishments decreased 13 percent. The total of all deliveries under power and exchange agreements decreased 1.8 percent from the comparable figure of the year before.

Noncoincidental maximum demands under power contracts for publicly and privately owned utilities are shown in detail by customers in the accompanying table. Energy deliveries and dates of initial service are also shown by customers.

PUBLIC DISTRIBUTION

At the end of the fiscal year the Bonneville Power Administration had signed contracts with 54 publicly owned utilities and cooperatives. During the fiscal year, a contract with one publicly owned utility had been canceled and another had been added, leaving at the end of the fiscal year the same number of contracts with publicly owned utilities as were in existence at the end of the previous fiscal year.

Of the 54, all but 12 of the publicly owned utilities are now taking power, either under power or exchange contracts. Deliveries to the 42 publicly owned utilities for the fiscal year amounted to 823,817,368 kilowatt-hours, an increase of 13 percent over the previous fiscal year. During this fiscal year, 504,384,200 kilowatt-hours were delivered to municipalities which is an increase of 6 percent over the previous fiscal year. The deliveries to public utility districts amounted to 272,999,252 kilowatt-hours and is an increase of 27 percent over the previous year. The cooperatives received 46,433,916 kilowatt-hours of energy, an increase of 23 percent over the previous year.

The noncoincidental maximum demand during the year for these publicly owned utilities was 73,219 kilowatts.

The public agencies distributed low-priced Bonneville power under the best American business tradition of delivering it at the lowest possible cost to the ultimate consumers.

For the calendar year 1944, the 38 publicly owned distributors—omitting Centralia, Eugene, Seattle and Tacoma—received a gross income of \$4,802,889; and after deducting the cost of power, other operating expenses, depreciation, taxes and interest, had a net income of \$761,044. The net income amounts to approximately 16 percent of the gross revenue and included in the deductions from the revenue are taxes amounting to \$203,374.

These 38 public agencies had cash on hand or invested in United States bonds amounting to \$3,024,777, which exceeds slightly the accumulated surplus of \$3,013,845. The cash on hand of \$3,024,777 is 14½ percent of the total long-term debts of these distributors. The cash on hand also amounts to 63 percent of the gross annual revenue. This financial showing by the public distributors leaves no doubt as to the financial soundness of these distributors and the ability to distribute power to the ultimate consumers at the lowest possible cost.

Data for the cities of Centralia, Eugene, Seattle, and Tacoma have been omitted from this tabulation for they have distributed power for many years; Tacoma—for more than 50 years. These are well-established and they received during the past fiscal year only a small part of their energy requirements from the Administration.

SYSTEM POWER RESOURCES

No new generators were added to the system during the fiscal year ending June 1945; however, the generating capacity was sufficient so that by careful scheduling of outages, each of the 18 main units at the Bonneville and Grand Coulee plants could be shut down for annual overhaul and maintenance.

Although the total load on the Bonneville-Grand Coulee system was slightly less than that of the previous year due to cutbacks in war production, increased deliveries to the utilities of the Northwest power pool largely offset the decrease in industrial load.

With stream flows in the Northwest below normal during the summer and fall of 1944, the Administration delivered large blocks of power to other utilities in the region to enable them to meet their load requirements without burning critical fuel oil for power production. By the last week in December, all storage reservoirs west of the Cascade Mountains had been pulled down to their rule curves, or below, and schedules for power from the Administration and other pool utilities were suddenly increased to an all time high. As a result of these high deliveries to the pool, the Bonneville-Coulee system established a record 60-minute peak generation of 1,427,000 kilowatts on January 4, 1945. During the hour of this peak, 623,000 kilowatts were delivered to pool members for their own use. Moderate weather and heavy rains beginning the second week in January and continuing intermittently throughout the winter and spring, relieved the Northwest water shortage and consequently decreased Bonneville Power Administration deliveries to other pool members.

The flow of the Columbia River was below average practically all year, and was below the minimum on record for part of the time. Nevertheless, the power resources of the Bonneville Power Administration were adequate to meet all demands for energy.

During 1945, as in 1944, the Bonneville and Grand Coulee power plants supplied approximately 50 percent of all electric energy consumed in the five Northwest States of Washington, Oregon, Idaho, Montana, and Utah. The task of scheduling loads and regulating the frequency of the entire power pool was carried by the Administration throughout the year, with the actual regulation being done at either the Bonneville or Grand Coulee power plants, depending mainly on water conditions.

The following tabulation of energy receipts and deliveries shows the Administration's major contribution to the Northwest power pool during the past fiscal year. Deliveries to other utilities for their own use increased from 1,810,602,507 kilowatt-hours in fiscal year 1944, to 2,401,859,000 kilowatt-hours or 32.65 percent.

¹ The other members of the Northwest power pool—power systems in Utah, Montana, and Idaho—are not directly interconnected with the Bonneville-Grand Coulee system.

In order to meet the power requirements of other Northwest utilities, several new points of interconnection were established during the year. The first, a temporary tie with the Portland General Electric Co., made at Bonneville's St. Johns substation on July 9, 1944, to relieve overload conditions, was discontinued on November 15 when the company's two underwater cables across the Willamette River were ripped out by a ship's anchor. Failure of these cables resulted in serious curtailment of power to a part of the company's system, but fortunately it was possible to bring into service on the same day a new interconnection with the company, tapping the Administration's St. Johns-Oregon City lines near the Linnton district of Portland.

To further increase deliveries of the Administration's power into the Portland area, one Bonneville generator was isolated to feed power directly into the Northwestern Electric Co.'s system through a temporary interconnection with the Bonneville-Alcoa No. 6 line. This tie was still in service at the end of the fiscal year, pending installation of a permanent interconnection at the Troutdale substation.

A cable failure on the Puget Sound Power & Light Co.'s system between Richmond Beach and President Point occurred on October 25, 1944, and in order to supplement the reduced capacity of the remaining cables and to assure an adequate supply of power on the Olympic peninsula, it was necessary to close the Bonneville Power Administration-Tacoma-Puget Sound Power & Light Co. loop at Bremerton. Except for normal operating outages, this loop has been closed continually since that date.

During the year, stream flow gages were installed on the Columbia River at Trinidad, Umatilla, and Celilo; and on the Snake River at Clarkston and Five Mile Rapids. These gages consist of impulse transmitters and telephone connections to the dispatcher's office, enabling the load dispatchers to obtain immediate water flow data from the various points and to make maximum use of the available water.

CONSTRUCTION PROGRESS

Although shortage of materials, lack of adequate manpower, changes in design and other factors brought about by war conditions handicapped construction progress during the year, the major projects under construction were held close to original schedules.

The most important construction project of the year—the Covington-Grand Coulee Line No. 2—was completed on October 6, 1944, approximately 1 month ahead of schedule. Energization of this line eliminated a serious transmission bottleneck in the Seattle area and reduced the load on the Grand Coulee-Covington Line No. 1 to normal or below. Prior to completion of the second line, Line No. 1 had been carrying up to 251,000 kilowatts, an overload of 41,000 kilowatts, to meet power requirements in the Puget Sound area.

The major construction projects started during the fiscal year were the Columbia substation, a new 230,000-volt substation near Rock Island on the Columbia River, and a 51-mile 230,000-volt steel tower line from Midway substation to the new Columbia substation. Completion of the Midway-Columbia project will improve stability of the Bonneville-Grand Coulee System and increase the amount of energy that can be transmitted to the Puget Sound and Portland areas.

A total of 149.8 circuit miles of transmission lines of all types was built during the past fiscal year. Segregated by voltage classifications, this construction included 146.6 circuit miles of 230-kilovolt line, 11.9 circuit miles of 115-kilovolt line, and 1.3 circuit miles of low-voltage line.

Six permanent transformer banks, one single-phase transformer and four cooling fan installations, totaling 181,600 kilovolt-amperes; and two spare transformers totaling 25,000 kilovolt-amperes were installed at various substations. However, only 132,100 kilovolt-amperes was energized and placed in service. The remaining unenergized transformers, totaling 49,500 kilovolt-amperes are available for service to the customers when required. Three permanent transformer banks and one single-phase transformer totaling 38,712 kilovolt-amperes were removed from service, leaving a net increase of 142,888 kilovolt-amperes of transformer capacity installed and ready for service during the 1945 fiscal year.

The following tabulation shows, by comparison with fiscal year 1944, system additions placed in service during fiscal year 1945:

TABLE 4.—System additions

	Circuit miles			Total
	230 kilo-volts	115 kilo-volts	Under 115 kilovolts	
Transmission lines:				
Placed in operation during 1945 fiscal year.....	183.0	25.2	2.3	210.5
In operation on June 30, 1944.....	1,055.0	1,102.5	361.0	2,518.5
Leased to other utilities.....			-10.6	-10.6
Transferred to substation plant account.....		-2	-2	-4
Operated for U. S. Army-Hanford-Taunton.....		8.5		8.5
Total circuit miles in operation on June 30, 1945..	1,238.0	1,136.0	352.5	2,726.5
	Installed at end of fiscal year 1944	Fiscal year 1945		Installed at end of fiscal year 1945
		Added	Removed	
Substation facilities:

Switching stations (number).....	10	1	0	11

¹ Includes 49,500 kilovolt-amperes ready for service but not energized.

THE YEAR'S HIGHLIGHTS

LABOR-MANAGEMENT AGREEMENT

Of particular significance in the year's operations was the signing on May 2, 1945, of a labor-management agreement providing for a method of collective bargaining with hourly employees of the Bonneville Power Administration in the trades and crafts unions. This basic agreement was made applicable to all Bonneville hourly employees in the trades and crafts who are not subject to the Classification Act of 1923.

By the terms of the agreement, conference and consultative machinery and procedures, through the processes of collective bargaining, were set up (1) to provide for joint determination of fair and reasonable rates of pay, hours and working conditions; (2) to insure the making of appointments and promotions on a merit basis; (3) to promote stability of employment and to establish satisfactory tenure; (4) to provide for improvement and betterment programs designed to aid the employees in achieving their acknowledged and recognized objectives; (5) to promote the highest degree of efficiency and responsibility in the performance of the work and the accomplishment of the public purposes of the Bonneville Power Administration; (6) to adjust promptly all disputes, whether related to matters covered by the agreement or otherwise; (7) to promote systematic labor-management cooperation

between the Administration and its employees; and (8) to aid the reestablishment in civilian life of returning veterans.

COLUMBIA BASIN COST ALLOCATION REPORT

An earlier event of signal importance to smooth peacetime conversion in the Northwest was the completion and approval by the Secretary of the Interior on January 31, 1945, of the Columbia Basin Project Cost Allocation Report which was prepared jointly by the Bonneville Power Administration and the Bureau of Reclamation. The report was transmitted to Congress on May 8, 1945, and published as House Document No. 172.

According to the report, total estimated cost for the completed Grand Coulee project is \$487,030,228. This includes the total ultimate development of power generating capacity of 1,800,000 kilowatts of power and the completion of irrigation canals and facilities for the irrigation of 1,029,000 acres of arid land in central Washington. The project will provide a livelihood for about a quarter of a million additional people on farms or in industry and service in the project area and for many others in industry and service elsewhere in the Pacific Northwest.

Repayments from power revenues will include \$348,065,228, or 70 percent of the total project cost, from commercial power sales by the Bonneville Power Administration and \$50,500,000 for pumping power supplied by the Bureau of Reclamation to irrigate the project.

Of the remaining investment, farmers who irrigate the 1,029,000 acres of new agricultural land in the project will repay \$87,465,000, or an average capital cost of \$85 per acre for their water.

Under the terms of the report, the Federal Government will be repaid all its reimbursable investment in the Columbia Basin project within 75 years, and during that period the project will be maintained out of power revenues so that it will be in excellent operating condition after the capital cost is repaid.

The report states that existing rates of the Bonneville Power Administration are expected to produce revenues sufficient to return the power investment with interest, and to repay all irrigation and other reimbursable costs of the projects which cannot be repaid otherwise, as well as meeting all estimated obligations in connection with the Bonneville-Grand Coulee transmission system.

Commercial power revenues also will be used to establish a special treasury fund amounting to \$70,786,815 over the repayment period. This money will be available for possible reduction in water and power rates at Grand Coulee, or for assistance to other irrigation and power projects in the Columbia River Basin.

BONNEVILLE DAM PROJECT COST ALLOCATION REPORT

On June 26, 1945, the Federal Power Commission entered an order making a final allocation of the capital costs of the Bonneville Dam project incurred to June 30, 1944, including interest during construction at the rate of 2.5 percent per annum. The order fixed the total cost at \$83,709,430, of which \$5,784,055 was incurred for facilities solely for improvement of navigation; \$37,681,648 for facilities solely for development of power; and \$40,243,726 for facilities having joint value for the production of electric energy and other purposes.

The Commission allocated to power \$20,121,800, or 50 percent of the investment in joint purpose facilities. This sum plus the direct power facilities of \$37,681,648 makes a total power investment at Bonneville Dam of \$57,803,448 as of June 30, 1944.

Supplemental allocations will be made by the Federal Power Commission to include costs incurred subsequent to June 30, 1944, in completing the Bonneville project.

With actual plant investment and operating cost data now available for both the Grand Coulee and Bonneville projects, the Bonneville Power Administration is having an independent commercial audit made covering cost accounts of the Administration and the two generating projects. Upon completion of the audit a comprehensive financial report will be prepared covering the operations and financial status of the entire Federal power development on the Columbia River.

BONNEVILLE REGIONAL ADVISORY COUNCIL

Contributions of great value to the development of the Administration's programs were made by the Bonneville Regional Advisory Council during fiscal 1945. Representative leaders in business, industry, agriculture, education, government, and the press have served either as active members or invited guests at the various meetings of the Council in conferring with the Administrator on matters of moment concerning regional policies and the Bonneville developmental program.

Of particular interest in the activities of the Council was the adoption of a report prepared by an independent committee regarding the question of a coordinated river development program.

Other matters of importance studied and reported upon at Council meetings throughout the year included rural electrification, relation of freight rates to industrial development, electric house heating, power rates for industry and for irrigation, the Administration's advanced marketing program, the transmission construction program and problems involved in developing a coordinated research program for the region.

Southwestern Power Administration

DOUGLAS G. WRIGHT, *Administrator*

THE Southwestern Power Administration was created by order of the Secretary of the Interior on August 31, 1943, for the purpose of fulfilling the requirements of the Executive Orders 9366 and 9373 which provide for unified administrative control during the war of (a) the operation of the Grand River Dam project and the marketing of the power generated by the project, (b) the marketing of power generated by the Norfolk Dam project, operated by the United States Army Engineers, and (c) the marketing of the power generated by the Denison Dam project, also operated by the United States Army Engineers. The Southwestern Power Administration assumed these duties on September 1, 1943, with the present Administrator appointed as Acting Administrator.

The Flood Control Act of December 1944 vested in the Secretary of the Interior the responsibility for distributing and marketing the power output of the multiple-purpose reservoir projects authorized by the Congress for construction by the War Department. The Southwestern Power Administration has made a general study covering all of the constructed, authorized, and proposed War Department projects on the Arkansas, White, Ouachita, Red, Brazos, Neches, and Guadalupe Rivers.

PRESENT ACTIVITIES

GRAND RIVER DAM PROJECT

The Grand River Dam project was constructed by the Grand River Dam Authority, an agency of the State of Oklahoma, under a Public Works Administration loan and grant agreement. Construction was started in 1938 and the plant began commercial operation May 1, 1941. Of the total \$25,113,636 estimated cost of the project, \$11,113,636 was supplied by the Federal Government as a grant and \$14,000,000 as a loan which is to be repaid by the Grand River Dam Authority from revenues of the project. The initial installation was four 15,000 kilowatt generating units. Space was provided in the power plant for two additional identical units. The fifth unit was

purchased in 1941 by the Grand River Dam Authority, but priority ratings were not high enough to enable the manufacturers to proceed. Late in 1944, adequate priority assistance was granted, and installation of the unit will be completed by the end of 1945. The plant capacity will then be 75,000 kilowatts.

With the power supply for war production becoming critical in 1941, the President on November 21 assumed control of the project on behalf of the United States under section 16 of the Federal Power Act and designated the Administrator of the Federal Works Agency to operate the project and dispose of the power generated.

Contracts were negotiated for the sale of power to war industries. Forty-thousand kilowatts of the capacity were committed to the Ark-La Electric Cooperative, Inc., for transmission to the Defense Plant Corporation's aluminum plant at Jones Mills, Ark. Other war loads served are Camp Gruber near Muskogee, Okla.; the Oklahoma Ordnance Works near Pryor, Okla., and the Cardox Corporation at Claremore, Okla.

On September 1, 1943, control of the project was transferred to the Secretary of the Interior. With the end of the war approaching, negotiations have been started to return the control of the project to the State of Oklahoma.

During the period of Federal control, from November 21, 1941, through June 30, 1945, the gross revenue has been \$5,499,110.

NORFORK DAM PROJECT

On July 30, 1943, the President under Executive Order 9366 assigned to the Secretary of the Interior the responsibility of marketing the power and energy generated at the Norfolk Dam project in Arkansas, which is a combined flood control and hydroelectric development on the North Fork of the White River. This project was constructed and is operated by the United States Army Engineer Corps. The project was built with an initial installation of one 35,000 kilowatt generating unit and provision for three additional units. The cost of the Norfolk Dam project is approximately \$26,000,000.

The project was operated on an emergency basis while it was under construction to meet a critical power shortage in the Southwest during the last 6 months of 1944 and until March 6, 1945, when commercial operation was begun with a full reservoir. Revenues from the sale of power amounted to \$321,593 through June 30, 1945.

DENISON DAM PROJECT

The Denison Dam project was built and is operated by the United States Engineer Corps. It is located on the main stem of the Red

River between Texas and Oklahoma near Denison, Tex., and Durant, Okla.

The Denison Dam project, like the Norfolk Dam project, is a combined hydroelectric and flood control development. The cost of the project is approximately \$54,000,000. The initial installation consists of one 35,000 kilowatt generating unit, and provision for four additional units.

The project was operated on an emergency basis, like Norfolk, during the last 6 months of 1944 and until March 9, 1945, when commercial operation began. Revenues from the sale of power amounted to \$313,892 through June 30, 1945.

MARKETING POLICIES

The Grand River Dam project has its own transmission system which enables it to serve its customers directly and without relying on the facilities of others. Interchange agreements with the Public Service Co. of Oklahoma and the Oklahoma Gas & Electric Co. provide stand-by and off-peak steam-generated power and energy. Project sales for the fiscal year ended June 30, 1945, were 453,180,939 kilowatt-hours. During the war nearly all of the power has been delivered to war industries. A program of encouraging peacetime industries to locate in the area served by the project has been forwarded for 2 years, with the result that service to The B. F. Goodrich Co. at Miami, Okla., began in December 1944, and construction is under way to bring Grand River Dam power to the lead and zinc fields of northeastern Oklahoma. Introduction of low-cost power into the field will result in prolonging its life for probably 20 years, in the opinion of the major companies which operate in the area.

The Norfolk Dam and Denison Dam projects, on the other hand, do not have adequate transmission systems; it has, therefore, been necessary to sell the entire output of the projects to the neighboring private utility companies, Arkansas Power & Light Co., Texas Power & Light Co., and Oklahoma Gas & Electric Co., for the duration of the war. The contracts provide for a reduction in rates to power users of \$400,000 per year by the Texas Power & Light Co., and \$150,000 per year by the Arkansas Power & Light Co., with the additional provision that rates to the rural cooperatives served by the two companies shall not exceed 6 mills per kilowatt-hour for the duration of the agreement.

Under the 1944 Flood Control Act, the Secretary of the Interior is assigned the duty of marketing the power and energy generated at all dams built and operated by the War Department to Federal agencies, public bodies and cooperatives, and private companies in that order of preference, and is authorized to construct or acquire the necessary transmission lines and related facilities. Accordingly,

plans are now being made to interconnect the projects and carry out the directive of the act.

COORDINATED OPERATION

Coordination of operations between the three projects has been impossible during the war because the Government does not own the necessary interconnecting transmission lines, and some of the private companies, whose lines do not interconnect the projects, have been unwilling to make agreements for the interchange of power and mutual use of facilities. The Flood Control Act of 1944 enables the Secretary to accomplish the desired coordination by interconnecting the projects. Engineering studies show that by coordinated operation of the eight presently constructed or authorized projects in this area, the combined dependable output can be increased by 10 percent both in power and energy over the sum of their individual capabilities.

POSTWAR PLANS

The Flood Control Act of 1944 has made it necessary for the Southwestern Power Administration to plan an extensive program of transmission line construction for interconnecting hydroelectric projects in the Southwest and marketing their output. The conclusions and recommendations are included in a report to the Secretary entitled "Report on Comprehensive Plan of Power Distribution and Sales from Hydroelectric Projects as Authorized by the Flood Control Act, December 1944 (H. R. 4485) in the Southwestern Region—Arkansas, Oklahoma, Texas, Louisiana, southeastern Kansas, southern Missouri." It will be necessary to secure an average revenue of approximately 5 mills per kilowatt-hour for the wholesale power and energy delivered to consumers from the integrated system. The conclusions of the report are as follows:

1. The hydroelectric developments at the reservoir projects, under control of the War Department, must be fully integrated with each other, with existing utility system, and sufficient fuel burning generation to firm up their entire capacity to realize the full benefits of the power installations.
2. Adequate transmission and distribution facilities must be made available either by utilizing existing facilities or the construction of new facilities to bring the power from the interconnected hydroelectric developments to the load centers of the area, and to prospective users of the electric service if the most widespread use of the electric power and energy at the lowest possible rates to consumers is to be secured.

Bureau of Mines

R. R. SAYERS, *Director*

FOREWORD

THE prodigious effort of the mineral industries of the Nation to provide the raw materials for the weapons and munitions of war was supported throughout the fiscal year by the manifold activities of the Bureau of Mines. As the demand for mineral commodities of all kinds increased, the Bureau intensified its work of exploring mineral deposits and developing methods of treating ores, its investigations of fuel resources, its production of helium, its research on explosives, and its many other varied technologic and economic services to the extractive industries.

To help meet the needs for minerals from domestic sources, the Bureau conducted 150 exploratory projects and examined 850 additional ore deposits in 36 States and Alaska. The critical and essential minerals, such as tungsten, vanadium, chromium, zircon, coking coal, fluorspar, mica, asbestos, optical calcite, and crystalline quartz, received special attention. Lead and zinc deposits were explored in a dozen States. Copper deposits were likewise extensively explored, and two major low-grade deposits were confirmed by Bureau engineers in Arizona. A low-grade mercury deposit in California, estimated to contain 10,000 flasks, was disclosed by diamond drilling. Exploratory projects on pegmatites in 6 States stimulated production of strategic mica. Through continuation of the large-scale exploration of bauxite deposits in Arkansas and Alabama, approximately 90,000,000 tons of bauxite of all grades were added to the known reserves. The search for needed nonmetallic minerals was conducted in 12 widely scattered States. In the course of hundreds of such projects, new useful techniques were developed for diamond drilling, bulldozer trenching, and geophysical exploration.

In connection with the Bureau's investigations of mining methods, a method of tamping blast holes was devised which has lowered dynamite consumption 25 percent at mines adopting it, and a new micro-seismic method of determining rock pressure was further developed.

At its metallurgical experiment stations, demonstration plants, and

pilot plants, the Bureau of Mines developed and improved methods and processes for using mineral resources unsuited to ordinary treatments. Substantial progress toward this end was made with manganese from extensive low-grade reserves, and full-scale tests at steel plants assured an adequate market for an electrolytic manganese plant large enough to produce low-cost metal. Advances were made in processes for treating Montana chromite, Idaho cobalt, Alabama iron, South Carolina sillimanite, North Carolina feldspar, and the domestic and foreign fluorspar stock-piled by Metals Reserve Company. Numerous iron, copper, lead, and zinc ores were tested by ore-dressing methods, and experimental studies were continued on smelting iron-chromium-nickel ores of Oregon and Washington, leaching Wyoming vanadiferous phosphate shales, producing titanium and zirconium metals, reducing magnesium, and extracting alumina from low-grade bauxites, clays, and alunite.

Three ferro-alloy pilot plants, an electrolytic chromium pilot plant, and a bauxite mill were completed, and "breaking-in" operations progressed at a methane-reduction zinc pilot plant.

With fuel shortages still prevalent, the Bureau of Mines acted as consultant to industry, Government, and home owners on problems of efficient storage, selection, and utilization of coal and coal products. Fuel-efficiency and equipment-acceptance tests, together with a national fuel-conservation program, saved thousands of tons of coal. Anticorrosion studies and a feed-water-conditioning service helped protect 300 million dollars worth of boilers and lines at Federal and other plants. New sources of coal were explored in critical-shortage areas, and thousands of samples of coal, coke, peat, briquets, pitch, tar, coal dust, and organic compounds were analyzed. To aid anthracite producers, the Bureau studied mine-flood prevention, suggested methods for more efficient mining, and developed new uses for surplus anthracite fines. Completion and successful testing of a large gasification retort brought cheap, abundant lignite nearer integrated industrial usage.

Wartime demands having cut sharply into known petroleum reserves, the Bureau stressed research on methods of recovering more oil from old fields and increasing the use of crudes held undesirable by refiners because of their sulfur content. With the major effort centered on condensate fields which produce petroleum suitable for blending or "building" special aviation fuels, seven reports were published on stimulative production methods. The results of these and other studies were submitted to operating companies and Government agencies concerned with meeting the war needs for special lubricants, fuels, and chemicals.

Looking still farther ahead to the day when auxiliary sources of oil and gasoline may be needed to fuel the motorized economy, the

Bureau was well on its way toward the development of synthetic liquid fuels. With Congressional authorization, construction started on a laboratory at Bruceton, Pa., for research on the hydrogenation and gas synthesis processes of producing oil from coal, on a laboratory at Laramie, Wyo., to develop oil-shale distillation processes, and on a demonstration plant at Rifle, Colo., to provide for private industry a technical and economic prospectus on the possibilities of exploiting the country's rich and immense oil-shale reserves. The Bureau engineers went abroad to obtain first-hand information on synthetic fuel operations at plants captured from the Germans. An oil-shale mine was opened in Colorado.

Production at the Bureau's five helium plants, which extract the world's supply of this useful lightweight, nonflammable gas from natural gas, continued at approximately the same rate, for commercial demand increased sharply as direct war uses declined. Helium in Federal gas fields was conserved by increasing the proportion obtained from privately produced natural gas that is being piped to commercial markets, and reserves were augmented by injecting the surplus from this source into the subterranean vaults of the Government-owned Cliffside field for storage until needed. Bureau engineers developed another new use for helium, employing it to trace the underground movements of oil and gas.

To aid industry in conserving irreplaceable equipment and experienced manpower, the Bureau intensified its safety and security programs. Accidents declined and output mounted as the coal-mining industry, demonstrating an increasing acceptance of the recommendations of the Federal inspectors, made innumerable safety improvements in the 3,400 coal mines visited during the year. Bureau engineers and safety instructors trained thousands of additional workers and officials in first-aid, mine rescue, and accident-prevention procedures. They assisted at major mine disasters and investigated mine accidents, explosions, and fires. Mine equipment and materials were tested for safety in the Bureau's laboratories, where special investigations on safe equipment design also were continued for the Navy.

Attesting to the whole-hearted cooperation of the mineral industries in the Bureau's wartime plant-security assignments, the record still was free of a single known case of sabotage when the mineral-production security program was terminated and the explosives control program was curtailed at the close of the fiscal year.

Thousands of chemical analyses and control tests were made on explosives and flammable gases, many for other Government agencies, and cooperative inspections were conducted with the Army, Navy, and State agencies on the storage of explosives. New explosives for mining and military use, and explosive devices captured from the enemy were examined; and research was continued on the ignition of

gases and dusts by explosives. New schedules were prepared governing the use of higher charges of unsheathed explosives and the testing of Diesel mine locomotives for use in the gas- and dust-laden atmospheres of coal mines. A method for determining detonator efficiency was developed, and an electronic chronoscope which measures time intervals of a millionth of a second was invented and used in Bureau and military tests on explosives.

To guide Bureau engineers and mine inspectors in preparing gas- and dust-control recommendations, some 19,000 mine-air and coal-dust samples were analyzed for explosion hazards. Advances were made in methods for determining atmospheric contaminants, and many respirators were tested for efficiency.

As the chief source of economic and statistical information on minerals, the Bureau provided the basic facts on domestic and foreign production, stocks, distribution, and consumption required by war agencies and industries to guide their programs. Toward the end of the year, these fact-finding and economic services were being revised to enable industry to meet many reconversion problems and to permit Government to determine policies in regard to potential utilization of surplus war plants, appraisal of postwar employment prospects in the mineral industries, and the use of mineral resources in proposed river-valley development projects. Facts on the causes and frequency of accidents in the mineral industries, also collected and analyzed by the Bureau, proved their worth in helping to keep accident rates within bounds under difficult war conditions.

Demands from industry, war agencies, and the public for published information continued to increase, and the Bureau prepared and issued many bulletins, technical papers, handbooks, and other reports. A large number of other reports necessarily had to be issued on a confidential basis. However, under a rigid policy of economy, the number of copies printed and distributed was held to a minimum. The shortage of paper and difficulties of printing made it necessary to delay the publication for general use of other reports. It is hoped that the accumulation of all the valuable wartime information can be published and made available during the forthcoming year to service the minerals industries and the general public in the reconversion period.

FUTURE WORK

War experience has indicated that the Nation's known reserves of many minerals are inadequate to meet peak emergency demands. This fact emphasizes the need for advance preparation to strengthen the country's domestic mineral position for any future crises. There is wide agreement that such preparation should include some provision

for national stock piles of strategic and critical materials, together with an exhaustive mineral exploration and metallurgical research program. Surplus war materials would provide the nucleus for a stock-piling program, and their storage would prevent a deflation of mineral prices that would be inevitable if they were dumped on the market.

A comprehensive inventory of the Nation's mineral resources is needed urgently. No accurate, or even reasonably correct, estimate of the location, extent, quality, and minability of the various ores in the United States and Alaska now exists. Neither are the ways and means of utilizing them fully known. Had this knowledge been available when the war began, it would have saved time, money, and possibly lives. With the passage of the Strategic Minerals Act in 1939, the Bureau of Mines was permitted to make a modest start on a mineral inventory but only a start. When the "day of infamy" occurred at Pearl Harbor, the objective necessarily was shifted to that of finding deposits that could be brought into production immediately. Time was of the essence and there was none to spare for the usual decided lag between exploration and production. Exasperating delays occurred, nevertheless, particularly where methods of mining and treating marginal deposits had not been tried out in advance, for production does not follow in all cases merely because high prices are offered for the contained metal in such deposits.

A continuing program is proposed, therefore, which will include both exploration of reserves and investigation of mining and treating methods so that marginal deposits of strategic minerals can be an effective bulwark against any future emergency. Changing projected needs for a national emergency and continually advancing technical knowledge require a long-term program subject to constant revision so that plans for the development and treatment of large strategic reserves will be the best available and ready for use at once should the need arise. The Bureau is capable and willing to undertake such an assignment.

If the mining and metallurgical processes for low-grade and complex ores were developed and made available, some marginal deposits would come into economic production before another national emergency would be likely to occur, thus contributing to the well-being of industry and the national defense. Small operators interested in such deposits require help, particularly because they are unable to retain research staffs and operate laboratories and pilot plants as large corporations do. Not only technical assistance is required, but economic advice as well, encompassing marketing studies and analyses. The Bureau will continue to render such services to the best of its ability.

The mineral industry has acquired many other problems as a result of the war. In the race against time to provide minerals for war,

much of the usual long-range development work has been deferred in existing mines. Some aid may also be required on such problems as acquiring new machinery or replacing old machinery, improving roads, and obtaining financial backing and skilled manpower. The Bureau will continue to assist as much as possible in accordance with the functions that have been delegated to it.

The national security and the national economy are closely linked in all fields, but particularly so in the mineral industry. If the Nation is to be in any sense secure, it must have a healthy, thriving mineral industry.

To insure the survival and maintenance of such a going industry, consideration must be given to its problems. Victory will abruptly wipe out the Government's war procurement programs for minerals and metals and reduce the premium prices that had been paid for some of these products. Reconversion of war plants, modernizations and repairs for railroads and other heavy industries, and long-deferred demands for consumer goods undoubtedly will take up part of the slack for several years, but domestic producers will require a permanent market and a stable price structure. Lest these be imperiled, careful consideration of the problems of international trade and the disposal of war stocks of metals and scrap will be necessary. The extractive industries must be assured of a helpful and stable national mineral policy if they are to prosper.

SUMMARY OF ACTIVITIES

EXPLORATION AND METALLURGICAL RESEARCH

As the decisive campaigns of the war opened and the demand for raw materials necessary to the manufacture of arms and munitions increased, engineers of the Bureau of Mines intensified their quest for adequate sources of metals, and metallurgists redoubled their research on methods for utilizing the vast reserves of low-grade mineral deposits. Substantial progress was made in each field.

During the fiscal year 1945, the engineers examined 850 mineral deposits and conducted exploratory projects on 150 deposits in 36 States and Alaska. Meanwhile, the metallurgists solved problems of immediate importance in supplying critically needed materials for war together with some of longer-range significance.

To the engineer in the field and the metallurgist in the laboratory, the approach differed but the objective was the same—more effective utilization of the mineral resources to the end that they might make the greatest possible contribution to the Nation's economy and security.

Criteria for Projects

In selecting deposits for exploration, restrictions upon the Bureau required that one of the following criteria apply in each case:

1. Geologic, geophysical, or engineering evidence must indicate, in the judgment of the Bureau's engineers, that the project has a possibility of making a substantial contribution to the national economy; or
2. The project must show promise of making a direct contribution to the national security, such as the possibility of producing material for Government stock pile; or
3. The project must have been specifically authorized and directed by the Congress.

Following exploration, samples from the mineral deposit were submitted to the Bureau's laboratories and pilot plants to determine whether the material could be treated commercially by known methods. If not—and this frequently is true now that the “cream-skimming” period of mineral exploitation has reached its denouement in the United States—new processes of treatment were sought. In this manner some low-grade mineral deposits become actual ore reserves.

In the course of conducting hundreds of exploratory projects, the Bureau of Mines developed several useful new exploratory techniques. In a northern iron district, glacial drift as much as 90 feet in thickness overlies important deposits of magnetite iron ore. Because of numerous boulders in this unconsolidated material, it was difficult to drill through to solid rock. A new technique was developed on the spot by the engineers. The method was to freeze the moisture in the gravel, in order to hold the boulders firm so that they could be drilled and then permit the unconsolidated material to be cored. In one case, the penetration of 90 feet of such material—formerly requiring 2 weeks—was accomplished by this method in 9 hours.

From the beginning of the exploratory program, extensive use was made of the bulldozer for trenching through overburden to expose ore bodies at considerably less cost than the older hand methods. Trenches that would have taken half a dozen men several weeks to dig with pick and shovel were excavated in a few hours by a single bulldozer operator.

By placing pressure and speed gages on hydraulic-feed diamond drills and correlating the results with the type of rock and percentage of core recovery, the Bureau hopes to improve and perfect control of drilling operations.

Geophysical exploration methods are being more widely used and useful new instruments are being perfected. For example, a sturdy, self-leveling magnetometer has been developed which is sensitive enough for most purposes and which permits set-ups to be made and readings to be taken in about half the time needed with other instruments.

As mining problems also must be solved to obtain maximum production of domestic mineral resources, the Bureau, at its Mount Weather Testing Adit, developed a method of tamping blast holes which has saved 25 percent in dynamite consumption at several operating mines where the procedure was adopted. The Bureau continued its work in developing new uses for the microseismic method of determining rock pressure. Two investigations in progress may ultimately lead to the recovery of several million tons of high-grade ore from mine pillars.

In the field of metallurgical research, the Bureau's Pacific Experiment Station at Berkeley, Calif., during the war developed fundamental data for compounds involved in processes under study at other experiment stations and pilot plants, while the Rare and Precious Metals Experiment Station at Reno, Nev., functioned primarily as an analytical laboratory serving exploration projects for war minerals.

Iron, Steel, and Ferro-alloys

Continuing its search for additional reserves of iron ore and ancillary materials required for a record steel production, the Bureau of Mines explored by drilling, trenching, or tunneling 76 deposits in 27 States and Alaska. These included 32 iron, 16 fluor spar, 10 coal, 6 manganese, 5 tungsten, 5 nickel, and 2 chromium deposits. In addition, some 450 deposits were examined by Bureau engineers.

Important reserves of iron ore aggregating many millions of tons were indicated in Arizona, Utah, Alaska, New Jersey, New York, Pennsylvania, Missouri, and Virginia. Studies made in Alabama offer promise that significant tonnages of usable ore may be recovered from the tailings of former operations.

Results of pilot-plant and cooperative investigations on manganese during the year justify the prediction that the United States may be considerably less dependent in the future upon foreign sources of this strategic metal. Tests conducted largely in cooperation with the steel industry disclosed that the electrolytic manganese produced in the Bureau's pilot plant at Boulder City, Nev., has enough applications in industry to assure an adequate market for a plant of sufficient size to attain low production costs.

The Bureau completed tests on Three Kids manganese ore from southern Nevada and made detailed estimates of capital and operating costs for a commercial plant capable of producing 40 tons of metal a day. Electrowinning campaigns also were carried out on samples of Ladd mine ore from California, carbonate nodule concentrates from Chamberlain, S. Dak., and oxide ore from the Metals Research Company stock pile at Deming, N. Mex. Development of Carra mining and conical rolls separation for the Pierre manganese shale near Chamberlain, S. Dak., on which considerable work was

done during the year, promises a substantial reduction in production costs. This development, together with the successful electrowinning campaign on nodules at Boulder City, may eventually lead to the peacetime exploitation of the South Dakota deposit, the Nation's largest manganese reserve, containing some 50 million tons of manganese in nodular form. Research continued on the production and study of alloys made with electrolytic manganese. At Salt Lake City, Utah, campaigns were carried out in the small dithionate leaching plant on manganese ores from Arizona, Nevada, and Utah.

Construction and equipment installations progressed at the new ferro-alloys pilot plants at Rolla, Mo., and Redding, Calif., while plans were completed for a similar pilot plant at Raleigh, N. C. Investigations to be made at each pilot plant will seek methods for utilizing steel and ferro-alloy raw materials occurring in the vicinity.

An electrolytic chromium pilot plant with a daily capacity of 100 pounds of metal was brought into operation at Boulder City, Nev., treating Montana chromites. At Minneapolis, Minn., agglomeration tests on mixtures of off-grade Montana chromite concentrates and Russian chromite fines yielded a satisfactory feed material for ferro-chromium furnaces. Cobalt concentrates produced at Salt Lake City from low-grade, complex, cobalt-copper-silver-gold ore of Idaho's Blackbird district were treated successfully in a 5-pound-a-day electrolytic cobalt pilot plant installed during the year at Boulder City, Nev. Small-scale smelting tests on the production of nickel-iron from iron-chromium-nickel ores of Oregon and Washington were continued at Salt Lake City, and larger-scale tests are planned at the Northwest Electrodevelopment Laboratory at Albany, Oreg. Late in the year, laboratory tests on the extraction of vanadium and phosphate from extensive deposits of Wyoming shale culminated with the installation and operation of a small pilot plant at Salt Lake City.

Beneficiation tests were made on iron ores and sponge iron products in laboratories at Salt Lake City, Utah; Rolla, Mo.; Minneapolis, Minn.; Tuscaloosa, Ala.; and College Park, Md. At Tuscaloosa, significant developments were made in the hydraulic classification and flotation of Alabama iron ores. Sponge iron produced in saggers at the Canton, Ohio, and Salisbury, N. C., pilot plants and in rotary kilns at the Laramie, Wyo., and Johnstown, Pa., pilot plants of the Bureau of Mines was used successfully in melting tests at several commercial steel and wrought-iron plants. Following laboratory tests at Salt Lake City, tonnage samples of Shasta, Calif., magnetite were magnetically separated and the high-grade concentrates were reduced at the Laramie pilot plant. It was planned to use this sponge iron in steel-making investigations at Redding, Calif. After magnetic separation tests at College Park disclosed that extremely high-grade concentrate could be made from magnetite ore occurring at Cran-

berry, N. C., a pilot mill was installed at the deposit to produce concentrates for the Salisbury sponge iron pilot plant. The highest quality sponge iron ever made in substantial amounts was obtained from these concentrates. At Minneapolis, experiments were completed on the Brassert bubble hearth-type of reduction with hydrogen and work was continued on shaft-furnace reduction of iron ore concentrates. At Salt Lake City, tests were continued on smelting and leaching methods of extracting iron and titania from the titaniferous magnetites of Iron Mountain, Wyo.

To increase supplies of critically needed acid-grade fluorspar, commercial milling of material stock-piled by the Metals Recovery Company was made possible by Bureau of Mines laboratory and pilot-plant flotation tests at College Park on Spanish fluorspar of metallurgical grade and at Rolla on similar Mexican and domestic material.

Nonferrous Minerals

In the field of the nonferrous minerals—lead, zinc, copper, tin, and the various pegmatites—the Bureau of Mines simultaneously carried on a far-reaching exploratory program, a broad research and development plan, and a major drainage project.

The exploration of 28 lead and zinc deposits in 12 States disclosed large reserves in Illinois, Idaho, Nevada, Kansas, and Oklahoma. Bureau engineers also examined 130 additional deposits during the fiscal year.

Despite shattered, caving ground and heavy inflows of water which retarded progress, the Leadville tunnel in Lake County, Colo., was advanced 4,800 feet or nearly a mile in the fiscal year 1945, bringing the total advance to 6,600 feet. This tunnel project, undertaken in the direction of the Congress, was designed to provide permanent drainage for 84 mines which have been flooded and idle since 1910. The purpose was to make available, upon its completion, an estimated 4 million tons of zinc, lead, and manganese ores, and revive the formerly productive Leadville district.

A major low-grade copper deposit was confirmed in Pima County, Ariz., and another deposit of considerable promise was delineated in Coconino County, Ariz., as the Bureau of Mines carried out 15 exploratory projects for copper in 9 States. Another 85 deposits were examined by Bureau engineers. Private interests are conducting further exploratory work on the Pima County deposit.

Meanwhile, considerable beneficiation work was done on copper, lead, and zinc at Salt Lake City, Utah; Rolla, Mo.; and College Park, Md. A pilot plant for reduction of zinc with methane gas was completed at Rolla and breaking-in operations were conducted. Cooperative investigations were continued with a commercial firm on improvements in the smelting of lead and zinc

A lode deposit of tin on the Seward Peninsula of Alaska, which has greater potentialities than any other known domestic source of tin, was tested through diamond drilling by the Bureau of Mines. Another tin deposit was explored in California.

Two mercury deposits, both in California, also were diamond-drilled by the Bureau. One of these, in Napa County, is estimated to contain 10,000 flasks of recoverable mercury sealed in low-grade ore reserves. Six other mercury deposits were examined by Bureau engineers.

Six investigations in as many States were conducted on pegmatites that yield feldspar, mica, beryl, tantalum, and lithium minerals. The principal objective of this work, which included explorations of many separate deposits, was to stimulate production of the strategic mica used in radio sets and aviation spark plugs. Forty-eight additional deposits of mica were examined. A flotation flow sheet developed several years ago in the Bureau's laboratories at College Park, Md., and Tuscaloosa, Ala., made possible the erection and successful operation of a 750-ton-a-day mill at Kona, N. C., to supply feldspar of the grade and in the amount needed.

Nonmetallic Minerals

Anticipating a major postwar demand for the commodities made from nonmetallic minerals—including building materials, insulating products, fertilizers, paints, pigments, and inorganic compounds—the Bureau of Mines explored 12 deposits in 11 widely-scattered States and Alaska. These included sillimanite, potash, optical calcite, and asbestos deposits, together with 2 barite and 6 corundum deposits.

Georgia's and South Carolina's huge deposits of sillimanite, a material used in the manufacture of refractory brick for high-temperature furnaces and spark plugs, hold promise of national self-sufficiency in this commodity, which the United States heretofore has largely imported. Mineral-dressing investigations at College Park and Tuscaloosa developed a procedure for grading sillimanite up from 20 to 98 percent purity with high recovery, and tests at the Electrotechnical Laboratory at Norris, Tenn., indicated that sillimanite concentrate can be substituted for scarce kyanite in refractory brick.

Approximately 50 deposits of nonmetallic minerals were examined by Bureau engineers. Their minerals include silica, oil shale, quartz crystals, kyanite, pearlite, pumice, talc, pyrophyllite, bentonite, and vermiculite.

Light Metals

Fortunately, the supply position of the United States improved during 1945 in the light metals—aluminum, magnesium, and their alloys. Hence, it was necessary to mine and use only a small portion of the reserves of bauxite—estimated to total 90 million tons of all

grades—indicated by large-scale exploration by the Bureau of Mines in Alabama and Arkansas.

Work continued at several laboratories and pilot plants on the extraction of alumina from low-grade bauxites, clays, and alunite, with particular emphasis on assisting in operation problems at Government-owned, semicommercial alumina plants. At Bauxite, Ark., construction of a pilot bauxite mill was completed, and breaking-in operations were started. At Rolla, Mo., laboratory beneficiation studies were made on bauxites to be treated in the mill. At College Park, Md., progress was made on the recovery of magnesium and aluminum from drosses, powders, and dust. Air tabling of magnesium sawdust recovered magnesium metal of suitable purity and particle size for reduction of titanium.

Significant advancements were made in the development of a new commercial metal, ductile titanium. This project was transferred from Salt Lake City, Utah, to Boulder City, Nev., where a production rate of approximately 100 pounds of metal a week was attained. A project was begun at the Albany, Oreg., Electrodevelopment Laboratory on the reduction of zircon, which is present in Oregon beach sands. As both titanium and zirconium are reduced with magnesium, their production might offer a post-war outlet for magnesium metal. The Albany laboratory will continue development work on the carbothermic magnesium reduction process, which had been studied at Pullman, Wash., and in cooperation with the Ford Motor Co. at Dearborn, Mich.

COAL AND COAL PRODUCTS

To combat the problem of solid fuel shortages which persisted in 1945, the Bureau of Mines promoted methods for more thorough mining of coal, improved preparation and upgrading of coal for specialized uses, and secured better utilization of coal and coal products in industrial establishments and homes.

In conjunction with its well-known fuel services, the Bureau analyzed more than 20,000 samples of various fuels during the year in its laboratories. This work helped maintain fuel efficiency at Army and Navy installations, helped keep war industries operating at full capacity, aided Federal coal-mine inspectors in preventing coal-dust explosions, guided Government fuel-purchasing agents, and assisted the coal exploration and research work of the Bureau. Maintaining its consulting service for Government agencies in the purchase and utilization of fuels and fuel-burning equipment, the Bureau saved thousands of tons of coal by recommending changes in the operation of equipment at many Army camps, eliminated difficulties that prevented continuous boiler operation at two Navy land stations, chose fuels for new Veterans' Administration projects, and

made scores of fuel-efficiency and equipment-acceptance tests. Federal boiler plants, including those at all Army posts, were safeguarded against boiler-scale corrosion and caustic embrittlement by the Bureau's feed-water conditioning service, and studies of corrosion in condensate return lines resulted in better protection for \$300,000,000 worth of steel equipment.

Thousands of volunteers were enlisted in a Nation-wide fuel efficiency program aimed at saving 29 million tons of coal a year and proportionate economies in the commercial and industrial use of other types of fuel and energy. More than 13,000 plants and establishments pledged cooperation as a network of some 20,000 engineers and fuel experts—virtually all serving without pay—carried the campaign directly to commercial, industrial, and institutional fuel consumers. Thousands of copies of publications incorporating up-to-date information on such subjects as coal storage and use were made available to industry.

Also directed at fuel-shortage problems, Bureau studies resulted in the establishment at Philadelphia of a packaged-fuel plant for converting 150,000 tons of surplus anthracite fines into a more convenient fuel and in the blending of anthracite fines with bituminous coal for stoker use.

Coal Mining and Exploration

Cooperating with anthracite producers, the Bureau studied problems of mine flood prevention and better methods of mining the thin, steeply pitching beds that constitute a large part of remaining reserves. Determinations were made on the economic limitations of light equipment for stripping coal from outcrops in mountainous areas. Coal fields of the West, South, and East were explored for minable reserves of coking coals, and the Pacific Northwest was scoured for adequate fuel supplies to relieve an acute shortage in that area. Laboratory petrographic examinations and coking tests were made on more than 150 coals of the United States, Chile, and China, and methods of increasing the production of Chilean coals were investigated.

Gas- and Dust-Explosion Research

To reduce explosion hazards in coal mines and many types of plants, tests were made on industrial powders, dust, and vapor-air mixtures. Recommendations and safety codes were formulated for plants producing explosive materials and dust, and specifications for conductive footwear and flooring materials were developed to lessen hazards of explosions from static electricity. Conditions permitting the safe use of larger charges of explosives in coal mines were determined by tests.

Coal Preparation and Storage

To augment diminishing reserves of high-rank coking coals and to up-grade marginal and lower-rank coals, studies were made on preparatory treatments to reduce sulfur and ash in coking coals and on the salvaging of refuse coal at points of origin. The distribution of sulfur in the coking coals of Greene County, Pa., was determined, and concentrating tables were found effective for recovering coke breeze from dumps. Two Alabama companies based designs for coal-preparation plants on washability data provided by the Bureau. Laboratory studies were made on the storage properties of about 35 coals.

Coal Combustion

Keeping pace with new developments in order to improve its service to industry, the Bureau of Mines became the first in the United States to employ the electron microscope for determining the surface area and size distribution of powdered coal. Needed information was provided on the burning characteristics of war-emergency fuels, including some produced by new processes. The Bureau developed apparatus to measure the thermal conductivity of coal-ash slags, permitting the study of slag deposits on boiler tubes from melted coal ash to provide the data required for improving the design and operating efficiency of boiler furnaces. Fundamental data were obtained in a study of more than 200 ash analyses, and studies of slagging and atmospheric conditions around furnace walls demonstrated one cause of tube failure and lessened boiler "outage," or time lost in maintenance and repairs.

Coking and Gasification Studies

Progress was made on two processes which offer promise of a cheap source of materials for a multitude of purposes. In the first, carbon monoxide of relatively high purity was produced by burning pitch coke or petroleum coke with oxygen. In the second, the Nation's immense reserves of lignite were brought closer to industrial use through the successful testing of a large retort for producing carbon monoxide and hydrogen from lignite by gasification. Evaluation of the gas- and coke-making properties of coals from newly developed fields greatly benefitted the coke and gas industries. Greater production and a more uniform grade product were obtained without increased capital or labor costs at several coke plants using the Bureau's data on coal bulk-density control, and others receiving direct technical assistance also reported higher operating efficiencies and increased outputs.

Synthetic Liquid Fuels

Major strides were made in the fiscal year 1945 toward the objectives set forth by the Congress in the Synthetic Liquid Fuels Act

(Public Law 290), which commissioned the Bureau of Mines to undertake a 5-year, \$30,000,000 research and development program to demonstrate and to provide private industry with the "know how" for making synthetic fuels from American coals and oil shales.

With sites chosen and construction under way at the end of the year on three of the four major installations required, research also was in progress in temporary laboratories. Buildings were being erected and equipment installed for a coal research and development laboratory at Bruceton, Pa., an oil-shale demonstration plant near Rifle, Colo., and an oil-shale research and development laboratory at Laramie, Wyo. The announcement of the location of the fourth and final installation—a demonstration plant for the production of oil and gasoline from coal by the hydrogenation and gas synthesis processes—was expected shortly, for detailed information already had been collected and analyzed on 206 proposed sites, in 21 States, including several war plants suitable for conversion. This demonstration plant, which will produce 200 barrels of oil a day by each process compared to 1 to 2 barrels a day from the preliminary pilot plants, will be designed to incorporate new German developments and ideas obtained in a study made during the year of captured documents and synthetic fuel plants.

At nearby Pittsburgh, a staff of more than 100 persons who will operate the Bruceton, Pa., laboratory is now engaged in fundamental research, process development, and engineering design. Progress has been made in developing an internally cooled converter designed to reduce the steel requirements for each production unit to one-fifth or even one-tenth of that required in the present European equipment. The effects of variables such as catalyst, temperature, and contact time on the primary liquefaction of coal by hydrogenation have been studied, and the experimental hydrogenation unit has been operated in a Bureau-developed process for the production of fuel oil from coal.

At Laramie, Wyo., research also was conducted in temporary quarters to obtain fundamental data needed for the design of experimental and demonstration plants for producing marketable products from oil shale. Among the investigations begun was the so-called thermal solution method in which the oil shale is heated to moderate temperatures (400° C.) in the presence of a solvent such as shale oil and then extracted with a more volatile solvent.

At Rifle, Colo., construction on the demonstration plant, roads, utilities, and housing was in progress at the close of the fiscal year. The processing section of the plant was designed to have retorts of several types, handling 25 to 100 tons of shale each per day, as well as equipment for refining the shale oil to produce salable products. A mine was opened which will provide up to 200 tons of shale

daily for the retorts, develop low-cost methods of mining oil shale, and demonstrate the costs of mining on a large scale.

PETROLEUM AND NATURAL GAS

To offset in some measure the immense withdrawals from the Nation's oil reserves during the war, the Bureau of Mines has stressed a three-phase program of conservation and better utilization, the objectives being to increase primary recovery of oil through more efficient utilization of the energy impounded with the oil in the native reservoir, to stimulate secondary recovery of oil from old fields, and to enhance the use of crude oils containing sulfur compounds which the refiners regard as undesirable. Unaltered by the weakening of enemy resistance, these are basic, long-range objectives in the field of petroleum and natural gas, and the Bureau's research toward their attainment will be continued.

In 1945, studies of primary methods of crude-oil extraction were intensified in the California, Rocky Mountain, and Gulf Coast fields with particular emphasis upon the gas-condensate reservoirs of the latter region. Engineering analyses of reservoir data were made for the operators and Government agencies concerned with three gas-condensate fields, each with multiple-zone production. Flow characteristics and other properties of the fluids from two of the reservoirs were determined on the spot in a specially designed mobile pilot plant, and fluids from the third reservoir were collected for subsequent laboratory analysis. In a study of reservoir conditions in Naval Petroleum Reserve No. 1 at Elk Hills, Calif., the Bureau performed service for the Navy and unit operators by analyzing more than 600 samples of unconsolidated cores and by determining gas-liberation and shrinkage data as well as other physical characteristics of the reservoir oils.

In Oklahoma's West Edmond field, a technique of diamond coring was introduced which has wide application in other fields where the use of steel bits causes low core recoveries.

The internal corrosion of tubing and wellhead equipment in fields where high pressures and temperatures exist has become a serious menace to life and property. Laboratory corrosion tests conducted by the Bureau under controlled conditions simulating those found in field practice indicated the probable corrosive effects of carbon dioxide and organic acids and disclosed the protective values of different chemical inhibitors.

Extending their research on stimulative methods of secondary recovery in fields long past their peak of production, Bureau engineers prepared reports on such operations in Illinois and the Appalachian region and on the history of water-flooding operations in Kansas. New techniques were developed in the water and core

laboratories which aided greatly in the interpretation of field data. Contamination of oil-field cores by "oil-base" muds was studied intensively. A pilot-plant process yielding a 90-percent recovery of microcrystalline wax distillate from tank-bottom settlements was developed successfully after many technical operating difficulties were overcome.

Wartime petroleum chemistry and refining research of the Bureau of Mines—involving superfractionation, hydrocarbon analysis, and engine testing of fuels—was channeled toward the maximum utilization of the less desirable domestic crude oils in aviation and other fuels. To this end, a comprehensive investigation was undertaken upon sulfur-bearing oils. Postwar developments will demand increased knowledge of the composition of petroleum, and the Bureau's wartime studies of aviation fuels will form the groundwork for research programs to obtain accurate information on the hydrocarbon composition and properties of distillates from all types of crude oils. During the year, 32 special restricted reports containing some 600 pages upon several phases of the aviation-fuel work were made available to refiners and members of technical committees. Many of these data will be applicable to postwar refining of aviation, motor, and Diesel fuels.

Precise values of certain fundamental thermodynamic constants were determined on 11 different pure hydrocarbons, heats of combustion were ascertained on blended fuels proposed for use in the latest types of aviation engines, and preliminary work was done on lead tetra-ethyl. The completion of a hydrogen liquefaction plant permitted the extension of low-temperature research to 435° below zero Fahrenheit).

HELIUM

Direct war uses of helium—a lightweight, nonflammable gas produced solely by the Bureau of Mines—declined somewhat in 1945, but commercial demand increased some 65 percent and other war-supporting uses also increased, permitting production to continue at approximately the same rate as last year.

The Bureau's helium plant at Otis, Kans., was awarded the Army and Navy "E" for outstanding production, and the plants at Amarillo and Exell, Tex., each received a star for their Army and Navy "E" ratings.

To conserve helium for future use, the Bureau established a gigantic underground cache by injecting all produced in excess of military and industrial needs into the Government-owned Cliffside gas field. This helium was extracted from natural gas being delivered by private producers to domestic and commercial markets and otherwise would have been lost. Helium in Government-owned fields also was con-

served by increasing the proportion taken from privately owned natural gas.

Now used as a tracer gas in underground oil and gas reservoirs to determine flow conditions, helium has provided the petroleum industry with a new and important tool. Bureau engineers introduced this technique in the Elk Hills Naval Petroleum Reserve with signal success. Many other industrial applications of helium have been developed to supplement its principal employment in the inflation of lighter-than-air craft. The Bureau of Mines, with its present facilities, stands ready to meet the demand occasioned by these and by other new uses still in the development stage.

EXPLOSIVES RESEARCH

Fostering the protection of life and property, the Bureau of Mines made many special investigations for industry and the armed forces on the safe manufacture and handling of explosives and explosive materials. In the course of these studies, the Bureau's technicians made more than 400 chemical analyses, 2,700 gallery tests, and 2,000 other control tests.

Research on the explosive properties of important combustible liquids and gases, such as high-octane gasoline and materials for synthetic rubber, enabled the Bureau to develop methods for preventing explosions. Inert atmospheres, for example, were used in loading incendiary war materials.

An investigation of the numerous acetylene generator explosions in shipyards, which was undertaken at the request of the War Production Board, disclosed that inferior carbide and improper generator operation caused a number of these disasters.

Following an extensive investigation of a disastrous fire which broke out when a storage tank containing liquefied natural gas failed at Cleveland, Ohio, on October 20, 1944, the Bureau of Mines prepared detailed recommendations for preventing the recurrence of such disasters.

To avoid fires and explosions caused by sparks and arcs from bare electric trolley wires in gassy and dusty coal mines, the Bureau encouraged the development of Diesel mine locomotives by preparing a schedule of permissible requirements for such locomotives.

To assist mines in meeting increased demands for coal, the Bureau determined the conditions under which the permissible charge of explosives may be increased from 1.5 to 3 pounds. A new schedule also was published which set forth the conditions under which permissible blasting devices can be fired without stemming. Sheathed explosives reduce or prevent fires and explosions caused by blasting in coal mines, but sheaths may increase toxic gas emissions under certain conditions and these are being studied. Hazards associated with the use of liquid-oxygen explosives also were being evaluated.

New equipment for testing explosives and detonators was intervals including an electronic chronoscope that will measure time invented, of a millionth of a second. Five more explosives were added to the list of permissible explosives, which now includes 178.

Cooperating with the War and Navy Departments, the Bureau determined experimentally hazards involved in the handling and storage of military explosives and incendiary materials, and a member of the Bureau's staff served as chairman of the Army-Navy-Bureau of Mines Board on the Storage of Smokeless Powder. A related study is in progress on the hazards associated with static sparks.

SAFETY, PLANT PROTECTION, AND HEALTH ACTIVITIES

An acute need for increasing war production in the mineral industries despite manpower and equipment shortages lent added significance to the safety and security programs of the Bureau of Mines in the fiscal year 1945.

Under these programs, the Bureau performed a multiplicity of services—virtually all devoted basically to the conservation of essential manpower and equipment in these industries. These services included safety education, accident-prevention training, accident investigations, material and equipment tests, coal-mine inspections and reports, prevention of sabotage with the cooperation of the armed forces, explosives control, and field and laboratory studies on the occurrence of gases, dust, temperatures, and other conditions affecting the health of mine workers.

The influence of the Bureau's safety programs upon the accident records of the mineral industries cannot be measured with exactitude, but it is significant that coal-mine fatality rates declined to the lowest point in the Nation's history.

Fewer American mine workers lost their lives for each million tons of coal produced in 1944 than in any other year on record. Despite numerous unfavorable safety factors incident to a war economy, including the necessity for producing a maximum quantity of coal, between 150 and 200 lives were saved in coal mines as compared with the previous year. The fatality rate for the first 6 months of 1945 likewise shows a heavy reduction over the same period in 1944. In fact, nearly 4,000 coal miners are alive today who might have perished during the last 3½ war years had coal-mine fatality rates remained at the levels of World War I.

Safety Work

The safety educational and investigative field work of the Bureau of Mines, an invaluable service to industry for more than 3 decades, is correlated and directed by the supervising engineers of the eight districts into which the country has been divided. These men,

veterans of many years experience in industrial safety work, also administered coal-mine inspection, explosives control, and mineral-production security activities within their respective districts.

During the fiscal year 1945, the Bureau's safety engineers and instructors trained more than 18,000 employees of mining and allied industries in first-aid and mine rescue procedures, increasing to more than 1,600,000 the total number of persons given these courses since the establishment of the Bureau in 1910. These men also assisted in conducting 22 first-aid contests in five States. About 1,200 workers and officials in the mineral industries completed Bureau courses in accident prevention, and approximately the same number received partial training.

In this safety-education program, the Bureau utilized extensively motion pictures, slides, demonstrations, and similar visual educational methods. Sound motion pictures were exhibited 231 times at safety meetings, and Bureau representatives attended and addressed 494 safety meetings in 29 States.

At virtually all major mine disasters occurring during the year, Bureau personnel assisted in the rescue and recovery operations which usually are arduous and dangerous in character. The aid thus rendered often enabled the mines concerned to resume production at relatively earlier dates. In all, Bureau engineers investigated 31 mine explosions in 31 States, 52 mine fires in 20 States, and 132 miscellaneous accidents in 30 States.

Following investigations in which 1,327 explosion tests were made, the Bureau gave its official sanction and approval to 26 units of electrical equipment designed for safe operation in gassy mines. Special investigations were continued on the design of safety equipment for naval use.

Had such services as first-aid and mine rescue instruction, accident-prevention training, accident investigation, disaster recovery work, equipment tests, and safety research been available from private sources, it is estimated that they would have cost the mineral industries considerably more than \$1,000,000 during the year. Such services could not be provided, however, by any means other than a similar national organization.

Coal-Mine Inspection

In the fiscal year 1945, Bureau of Mines representatives made 3,163 inspections and reports on coal mines producing approximately 91 percent of the Nation's total annual output. The reports on these safety surveys, most of which were reinspections, demonstrated an increasing acceptance of the Federal safety recommendations by the coal-mining industry, for hundreds of proposed improvements had been made in the mines since the previous inspections.

Virtually all of the mines in the United States employing 25 or more men now have been inspected at least once, and many have been examined several times. Greater attention was given last year to mines employing fewer than 25 men, more than 100 such mines being inspected. In accordance with an order from the Secretary of the Interior on July 1, 1944, the Bureau of Mines assumed responsibility for safety inspections of mining operations on the public domain, Indian lands, and other Government-lease operations formerly inspected by the Geological Survey. Many of these are small mines which ordinarily would not be inspected by the Bureau.

Federal coal-mine inspection has a definite dollar value to the industry, for accident reductions actually attained resulted in a money saving to the industry, considerably in excess of the hypothetical cost estimates.

Fatal and nonfatal accidents in the Nation's coal mines were reduced approximately 11 percent in 1944 as compared with 1943. On the usual basis for computing direct and indirect accident costs, this reduction represents a saving of upward of \$6,000,000 to the industry. Unquestionably the mines of the country are in a much safer condition today than they were before the advent of the Federal inspection program, and this program has been a large factor in bringing this condition about. The program also has influenced some States to modify their mining laws to parallel in part the Bureau's inspection standards.

Antisabotage

When activities under the mineral-production security program of the Bureau of Mines were ended officially on June 30, 1945, the World War II record of the Nation's mineral industries remained unblemished by a single known case of sabotage. In the absence of any subversive acts—and even a few might have seriously crippled the war program—it obviously is difficult to assess the extent to which the Bureau's activities are responsible for their prevention, but is believed to be appreciable. Cooperating closely with the Internal Security Division of the Office of the Provost Marshal General, the Bureau's engineers made surveys during the year at 36 facilities not formerly inspected, thus increasing to 2,911 the total number of mines, mills, smelters, and refineries inspected during the life of this program. Recurring inspections made at intervals of 90 days at the more important facilities totaled 395 for the year, or a total of 1,598 reinspections during the past 3 years.

Security inspections at coal mines were discontinued at the end of June 1944, permitting the reduction of field engineers engaged in this work to 16. The defeat of Germany made further curtailments possible, and the working agreement between the Bureau of Mines and the War Department was terminated in May 1945.

Explosives Regulation

At the direction of the Congress, the Bureau of Mines maintained close surveillance over the millions of pounds of nonmilitary explosives used during the year by American industries to make certain that none fell into subversive hands.

The Federal Explosives Act was administered through an organization of some 3,900 cooperating licensing agents serving without pay, at least 1 being designated in nearly every county of the United States for the convenience of applicants. In the fiscal year 1945, approximately 90,000 licenses were issued to individuals and firms requiring explosives, which increased the total number of licenses approved during the war to about 760,000, including reissuances.

Since the work was undertaken, the Bureau has found it necessary to revoke only 56 licenses, indicating that compliance has been obtained with a minimum of interference with business and industry. Most of the violations resulted from ignorance of the Federal requirements, and 14 of the revoked licenses have been restored upon request and assurances by the licensees that they would in the future comply with the act and regulations.

During the year, Bureau investigators inspected or reinspected more than 16,000 explosives magazines and submitted reports on each to the Washington office. In consequence, more than 7,500 letters of instruction or recommendation on safe practices were transmitted to licensees, and the replies indicated that 5,188 explosives magazines were improved to comply with minimum standards of construction and locking to minimize thefts.

Explosives control funds were reduced substantially at the end of the war, and early termination of this work was anticipated.

Health Work

Two broad objectives in the Bureau's over-all program—accident prevention and better working conditions in the mineral industries—were furthered materially by the analysis of numerous gas and dust samples, improvement of procedures for determining atmospheric contaminants, inspections of unhygienic conditions with recommendations for control measures, approval testing of respiratory protective devices, and determination of toxic gases produced by decomposition of cable insulation and plastic materials used in electrical equipment.

Approximately 19,000 samples of gas and dust were analyzed, guiding Bureau technicians in preparing recommendations to curb explosion and health hazards in mines, aiding in the control and extinguishment of mine fires, and determining places in mines where dangerous quantities of methane were being released, where ventilation was inadequate, and where injurious concentrations of harmful gases and dusts were present. The results also were helpful in evaluating hazards

associated with noxious gases in tunnels and military establishments, exhaust gases from Diesel locomotives, and rock-dusting materials.

Owing to the importance of the analyses of gas and dust samples in evaluating hazardous conditions, studies were continued to improve the various analytical procedures used for determining atmospheric contaminants. Definite advances were made in methods for collecting and indicating the concentration of dust and other injurious contaminants in the air.

Dust studies were made in more than 50 anthracite and bituminous-coal mines, and encouraging results have been obtained in the control of coal dust through better utilization of water to allay it and more efficient ventilation to dilute it to concentrations that are not harmful. Direct assistance was given in numerous instances in the installation of control measures, and indirect assistance was given by training mine personnel in dust collection and analysis techniques and by providing information on the effects and control of harmful substances. Inspections were made of change houses at both anthracite and bituminous-coal mines, and information will be published on the construction and operation of best types.

Approval testing of respirators was continued, and information on their proper use and maintenance was disseminated. A new approval schedule for nonemergency gas respirators was issued.

Observations were continued on the use of Diesel locomotives, tests being made in tunnels and roundhouses.

Confidential studies were conducted for the Navy Department's Bureau of Ships on the performance of various gas-indicating instruments and on the nature of the gaseous decomposition products of electric cable insulation and of thermosetting synthetic resins. This information will be of value in combating hazards in the mineral industries when these materials receive industrial application.

ECONOMICS OF MINERAL INDUSTRIES

The reduced military requirements for many metals and minerals and the gradual relaxation of restrictions on civilian uses subsequent to victory in Europe brought about various revisions in the economics and statistics services of the Bureau of Mines at the close of the fiscal year. These services which had provided invaluable information on production, stocks, distribution, and consumption of minerals for the guidance of industry and Government during the war were modified to meet the needs of the reconversion period. A host of new problems demanding immediate attention required a slight expansion of this fact-finding program.

The war had clearly demonstrated the need for importation of minerals not available in adequate quantities from domestic sources, compelling the Bureau to give more consideration to foreign supply

and to the conservational aspects of mineral utilization. In addition the disposition of immense quantities of scrap metal, the need for national stock piles of strategic and critical materials, and similar controversial but vital problems arose. The Bureau of Mines immediately began the collection, interpretation, and dissemination of the up-to-date, accurate information necessary for a solution of these problems.

In mobilizing for effective action, the Bureau did not overlook other postwar problems of mineral supply and development. Marketing studies and other types of economic analysis as well as basic fact-finding are required by industry to meet reconversion questions and by Government to determine sound policies for utilization of surplus war plants, to appraise postwar prospects for employment in the mineral industries, and to plan for the wide use of mineral resources in river-valley projects. The mounting costs of mineral production require careful study of the effects of taxation, transportation, wages, and other cost factors on the conservational use of mineral resources. Although the Bureau was insufficiently staffed for work of this kind, the program was initiated pending the anticipated granting of increased appropriations by the Congress for these studies.

Metals

During the fiscal year 1945, the peak was passed in the wartime effort to obtain a balance between mineral supplies and requirements. Plans for a smooth and orderly transition from war to peacetime activities in the metal industry began to take shape in a period which began shortly after the successful Allied landing on the Normandy coast.

Originally organized to meet growing industrial and governmental needs for factual information on the status of nearly all metals, the metal-reporting service of the Bureau of Mines was broadened during the early phases of the war to provide more frequently and in greater detail the basic data required by war agencies to direct and control distribution for military and essential civilian products. Now, in addition to the extensive series of confidential and published reports, numerous special studies were made for use in stock-pile planning, surplus industrial property disposal, standard commodity classification, and other programs of various agencies.

Victories in the military campaigns permitted a broad relaxation of censorship rules at about midyear. In view of the great number of requests for economic and statistical data which were received, indicating a growing consciousness by industry of the need for authoritative, factual information for guidance in the reconversion and post-war period, the Bureau made preparations to revise various metal canvasses which it has regularly conducted so as to include the

desirable features of those carried out by war agencies in order that continuity would not be interrupted when the emergency agencies were disbanded.

Nonmetallics

Supplementing its regular annual and other periodic statistical reports in the highly diversified field of nonmetallic minerals, the Bureau of Mines prepared for the war agencies special monthly or quarterly canvasses on minerals of noteworthy military importance and provided the answers to inquiries on current supply situation, new developments and uses, and various other factors associated with the industries.

To make this service possible, the Bureau's extensive information files on the nonmetallics were augmented with several thousand items of current data. Furthermore, field trips were made to areas where supply problems demanded attention with respect to such war minerals as asbestos, barite, graphite, and magnesite. For the third year, the Bureau prepared monthly and confidential series entitled "Mineral Trade Notes" and comprising abstracts of consular and other reports primarily on foreign mineral developments, for use of various war agencies.

Special reports were written on such critical minerals as optical crystals, graphite, corundum, and phosphate rock. A comprehensive survey was prepared covering international trade in all nonmetallics, and a 33-year history of the chemical raw material and fertilizer industries was issued. General reviews were compiled for the technical press of all major developments in the broad and complex field of nonmetallic minerals.

Petroleum and Natural Gas

During the war, much of the information normally published by the Bureau of Mines on the production and demand for crude petroleum, natural gas, and their products was available for confidential use by Government agencies only. In anticipation of the termination of such restrictions, the Bureau undertook to prepare special reports to show the major changes in demand on the domestic and world markets.

In the United States, the major oil problems of the postwar period will include the future rate of crude production, restoration of the normal supply of motor vehicles, and the expansion of aviation. Outside the United States, the discovery of new reserves in the Middle East, the increase in crude production in the Caribbean region, the restoration of devastated refineries and oil fields, and the future rate of consumption in enemy countries will materially change the international trade in crude oil and its products and make essential more complete and accurate information on oil supply and demand.

During the year, the Bureau of Mines made numerous special economic studies of distribution and trends of consumption in the field of petroleum. Its work also included collection of comprehensive statistics on refinery operation, including the production of aviation gasoline; the preparation of monthly forecasts of demand for crude petroleum; an annual survey of the consumption of fuel oils by States and uses; the production and distribution of natural gas, natural gasoline, related products, and carbon black; and assembly of data on foreign oil production and competitive trends in international trade in crude petroleum and refined products.

Well-developed before the war, the Bureau's services made possible an accurate analysis of the changes in demand during the war and will be of equal value in indicating postwar readjustments.

Coal

Now encompassing bituminous coal as well as anthracite, lignite, and other solid fuels and byproducts, the detailed studies of the Bureau of Mines on requirements, production, shipments, and use provided information indispensable to carrying out the distribution and pricing programs of the Solid Fuels Administration, War Production Board, Office of Price Administration, and other Government agencies concerned with solid-fuel shortages. This information served as a basis for the equitable distribution of anthracite, low-volatile, and special-purpose coals at a time of unprecedented demand and acute shortage. When broad-wage-scale revisions in all production coal fields required corresponding changes in maximum prices, the statistical facilities and trained personnel of the Bureau were made available to the war agencies in working out the adjustments.

Well-established weekly, monthly, and annual reports published by the Bureau were continued on an expanded scale, particularly those concerning the distribution of bituminous coal, anthracite, and lignite. Detailed studies were made on the production, consumption, and resources of coal in eastern European and Far Eastern countries at the request of the Combined Production and Resources Board. Staff members also worked closely with the Technical Industrial Disarmament Committee in the preparation of a report on the German solid fuels industries from a standpoint of national security.

Foreign Minerals

A program for postwar activity initiated a year ago developed during the fiscal year 1945 to a stage where adjustments in personnel and procedure were required to enable the Bureau of Mines to participate more actively in foreign investigations.

If the Congress approves legislation sponsored by the Department of State, the Bureau proposes to establish 18 regions throughout

world and assign competent technical specialists to the United States Foreign Service to aid this Government on problems relating to supplies of mineral raw materials. At the request of the Department of State, the Bureau now is extending mining and metallurgical technical assistance to Brazil under a \$25,000 congressional appropriation which restricts the investigations to those minerals in which the United States is deficient.

Several Bureau engineers visited Mediterranean and other European areas as studies of foreign mineral resources were extended to include areas liberated during the fiscal year 1945.

Accident and Employment Data

With critical labor shortages in the mineral industries focusing attention on accident prevention as a primary means of conserving manpower, information compiled by the Bureau of Mines on frequencies and causes of accidents and related employment data were used widely by the War Manpower Commission, War Production Board, and other Federal agencies charged with war labor procurement and production maintenance duties.

A confidential monthly series of employment and productivity data on bituminous-coal mines, assembled on a Nation-wide basis and later on a State basis were supplied to several war agencies. Mineral industry employment information was used to gage transfers of labor from unessential to necessary mining or war work and to measure the effective mine-labor force in localities and regions.

Detailed analyses of individual accident reports on the cause and severity of coal-mine injuries were undertaken through the Coal Mine Inspection Act as a standard feature of the Bureau's work. In addition to usual uses, virtually all of the regular accident statistics on the metal, nonmetal, and mineral fuel industries were used in one or more ways for war purposes. Facts on the constituents and consumption of industrial explosives were required by the armed forces as well as by those permanently interested in explosives production and markets.

PUBLIC REPORTS

During 1945 the volume of publications prepared and issued by the Bureau of Mines increased somewhat in response to a rising demand from industry, war agencies, and the public for informative material on virtually every subject associated with the mineral industries. In all, there were 660 publications, which required editing 20,520 pages of copy, reading proof, and preparing 2,437 illustrations for processing. The publications included 124 bulletins, technical papers, Minerals Yearbook chapters, miners' circulars, and other printed reports; 230 special war minerals reports for restricted use; 107 reports of investigations and information circulars; 177 speeches and

papers for the technical press; and 22 miscellaneous manuscripts, together with numerous periodic statistical reports for industry.

As in all the war years, however, the number of copies printed and distributed was restricted to the barest minimum to save funds and paper and the total number of copies issued remained substantially unchanged. Security restrictions on the distribution of the Minerals Yearbook were lifted after VE-day, making this authoritative publication again available.

The Bureau's Washington library of selected reference material was increased by 2,351 books and pamphlets and 207 bound volumes of periodicals; 247 periodicals were received regularly; and 19,611 books and periodicals were loaned for use outside the library. Approximately 5,000 readers visited the library for reference work, and about 4,500 telephone calls were received. The catalog of the library's collections was increased by 8,066 cards.

Free educational motion-picture films, produced under the Bureau's supervision and paid for by private industry, were shown on 84,959 occasions to audiences totaling 7,932,361 persons. Three new sound films entitled Sand and Flame, A Story of Copper, and A Story of Arc Welding, were added to the Bureau's library of more than 10,000 reels. The last-named is the first Bureau film in technicolor. These films, shown in many countries, were in constant demand for war training and rehabilitation classes, Army and Navy personnel, engineering and scientific societies, business and civic groups, schools and colleges, and other groups.

The Bureau continued to effectuate its policy of the widest possible dissemination of its technologic, economic, and scientific information consistent with national security, and made plans for reprinting and even wider distribution of its reports upon the termination of hostilities, in response to an ever-growing demand from industry for such information.

ADMINISTRATION

As in past years, activities of the Bureau of Mines were administered from Washington, D. C., but were carried on largely in the field offices, laboratories, and pilot plants. To handle more efficiently the large volume of administrative work, an Administrative Service was organized to include the divisions of Personnel, Field and Property, and Budget and Finance.

Personnel

On June 30, 1945, there were 3,974 full-time employees in the Bureau of Mines, distributed as follows:

Classification and number of appointees

	P & S	SP ¹	CAF	CPC ²	Total
Department.....	138	3	622	11	774
Field.....	920	364	763	1,153	3,200
Total.....	1,058	367	1,385	1,164	3,974

¹ Includes instrument makers, safety instructors, laboratory aids, assistants, etc.

² Includes laborers, mechanics, messengers, wage employees, etc.

Property

As of June 30, 1945, the property of the Bureau had a total cost of \$9,960,310.98, of which \$3,114,745.06 was for land, buildings, and improvements; \$2,368,139.74 for laboratory equipment; \$1,720,908.57 for machinery and power-plant equipment; and the remainder for office furniture and equipment, automobiles and trucks, rescue cars and specialized apparatus, and other goods.

Finance

The total funds available to the Bureau of Mines for the fiscal year ended June 30, 1945, including direct appropriations, departmental allotments, reappropriated balances, and sums transferred from other departments for service work, were \$28,988,520. Of this amount \$20,926,543 was spent, leaving an unexpended balance of \$8,061,977. In the regular work of the Bureau, \$19,162,455 was expended. These figures are subject to revision because of unpaid obligations.

Table 1 presents classified information regarding the financial history of the Bureau for the fiscal years ended June 30, 1942-46.

Table 2 gives a statement of the distribution of congressional appropriations to the services and divisions and the expenditure of these funds in 1945 by Bureau divisions.

TABLE 1.—Bureau of Mines appropriations and expenditures, fiscal years ended June 30, 1942-46

Fiscal year	Appropriated to Bureau of Mines	Departmen- tal allot- ments ¹	Funds transferred from other de- partments ²	Total funds avail- able for expendi- ture	Unexpended balances	Total expendi- tures	Expenditures, ex- clusive of service items ³

1 Available for expenditure in fiscal year 1946.

Geological Survey

W. E. WRATHER, *Director*

THE science of geology, no less than the other sciences, is becoming increasingly important to the Nation's social and economic welfare. The successful application of the principles of geology to the discovery and development of critically needed mineral resources and the successful application of geology for predicting terrain conditions in advance of our military operations represent some of the dividends that were paid to this country during the war as a result of the advancement of geology as a science.

Geology relates to the earth. The better we understand our earth—its composition, structure, and history—the better prepared we are to make the most of the land that we have.

Geological mapping is the mechanism by which our scientists determine the composition, structure, and history of the earth. Reduced to its simplest terms, geologic mapping consists of plotting on a plane map the intersections between the ground surface and the boundary planes that separate different kinds of rocks.

The agency responsible for making geological maps is the Geologic Branch of the Survey, and it plans to undertake extensive, systematic geologic surveys of many large areas of the country. These plans call for the utilization of every known refinement in mapping techniques and for the use of the most modern and varied techniques of geophysical exploration. Indeed, because even these will probably fall short of what should be done, the Survey plans also to carry out rather elaborate research to discover and develop new geophysical and geochemical methods of exploration and to continue and enlarge its research on the geologic and geochemical factors that determine the localization of mineral and mineral-fuel deposits.

The geologic mapping and research will cost something like 4 million dollars annually, for the work of searching hidden geology and determining ore controls is time consuming and costly. But geologic surveys repay their cost to the Nation many times over in augmented mineral wealth and economic benefits. The wartime work of the Geological Survey has already led to the discovery of 25 million dollars worth of new tungsten and mercury ores.

In addition to these domestic plans it is hoped that means can be found to continue and to extend the cooperative scientific work that has been conducted during the war by our Geological Survey and its equivalent agency in various foreign countries. These international projects not only bring mutual scientific benefits but they can become a strong contributing force toward better international understanding.

During the year the Alaskan Branch expended all of its efforts on projects that were carefully selected as being most pertinent to the successful carrying on of the war. The limitations of funds and personnel restricted the work to only a few of the more urgent projects. The projects carried on during the fiscal year were of three general kinds—investigations of deposits of minerals or search for deposits of minerals needed in the war, geologic investigations pertaining to problems of construction or maintenance of military or naval establishments, and planimetric and topographic mapping from aerial photographs.

Projects of the first kind were principally concerned with petroleum, coal, quicksilver, copper, tin, and zinc. Some of the petroleum work was carried on at the request of the Navy Department, and at that Department's expense.

Work of the second type included principally investigation of phenomena associated with permafrost, or permanently frozen ground, that bear directly on construction and maintenance activities over much of Alaska. This work was done at the request and expense of the War Department, and arrangements have recently been completed for continuing these investigations on an expanded scale in the fiscal year 1946. Brief investigation was made for the War Department of a volcano that erupted near an Army establishment in June. The purpose of the study was to determine the extent of danger to the establishment.

Work of the third type was the continuation of the compilation of aeronautical pilotage charts and maps from aerial photographs for the Army Air Forces. This work included the preparation of maps not only of parts of Alaska but of many other areas widely distributed over the world. In order to staff adequately this high-priority work it was necessary to postpone regular Survey planimetric and topographic mapping of Alaska although the need for more maps is continually becoming more acute.

In view of the greatly increased public interest in Alaska and the anticipated development of the Territory in the postwar period, it is planned to refocus the work of the Survey in Alaska to projects pertinent to the Territory.

Topographic mapping in the United States has proceeded at such a slow pace for the past 60 years that only a relatively small part of the country may be considered sufficiently well mapped to meet

present-day map requirements. One-half of the Nation is without topographic maps; the other half is provided with maps, but some of these are considered inadequate. This situation is deplorable, and action should be taken at once to make available maps essential to a survey of the natural resources of the Nation.

Topographic maps supply much of the basic data essential to a survey of the country's resources and are highly valuable for the economical and efficient planning of drainage, flood control, irrigation, water supply, hydroelectric and navigation projects; they decrease the number of expensive field surveys usually made in connection with the location of transmission lines, railways, highways, canals, tunnels, airports, and industrial plants and thereby reduce the cost of constructing such projects; they provide topographic data essential to the proper location of frequency-modulated and television radio stations and for recording and correlating data obtained from geologic investigations and thus aid immeasurably in the location, evaluation, and development of our mineral wealth. Maps of this kind provide information essential to the proper classification of the public lands, the conservation of the soil, and the administration and protection of the forests, both national and State. They are of great value for the administration and best utilization of the vast domain of public lands, enormous areas of which have never been mapped and concerning which administrative officials responsible for the enforcement of the public land laws are consequently without adequate knowledge of their extent, the character of the terrain, their intrinsic value, or the possibility of their development.

A comprehensive mapping plan is now being prepared in compliance with instructions from the Secretary of the Interior, under which, if funds are made available by the Congress, the serious handicap of inadequate map information could be overcome within the next 15 years. However, during the past year, as in other years since the beginning of the war, major emphasis has been placed on those operations that contributed directly to the war effort.

The authorized functions of the Geological Survey related to water consist of the collection and publication of information as to the quantity, quality, availability, and utility of the Nation's surface-water and ground-water resources. The quantities of both forms fluctuate widely because they are dependent on precipitation, which may range from 10 inches or less annually in arid regions, to 100 inches or more in humid regions.

Records of the fluctuations in available water are essential to its administration with respect to private, corporate, and governmental users, to interstate relations and compacts, to international problems and treaties, and to its efficient utilization for irrigation, navigation, sanitation, and power, for certain industrial processes, and for many

of the comforts of civilized life. As the available supply is inadequate in many places for the many uses that are made of water, the demands for it are conflicting, and pressing questions arise relating to priority of rights, superiority of use, and equitable division. Reliable information is essential to the stability of development, soundness of financing, efficiency of operation, and equity of adjudication and administration. Demands for reliable water information are therefore insistent and continuing. Moreover, information is wanted promptly when it is needed, and little or no time is available for collecting it. Therefore, needs for it must be anticipated and investigations must be started in advance of the probable call for the results.

It is the Survey's policy and duty to collect the essential information as to water resources as rapidly as funds will permit, giving priority to places of probable most urgent need. However, water investigations are largely financed by means of cooperation with States and municipalities, which leads to uneven distribution of investigations among the States. Such financing has the advantage of assurance that investigations will generally be made in those places where the need for them is most pressing, and the disadvantage that little or no provision may be made for starting investigations that will have more specific reference to needs that are not now pressing but will certainly be in the future. In recent years a program of gaging stations and observation wells supported by Federal funds and not dependent on the availability of cooperative State and municipal funds has been inaugurated and gradually developed. This program is, however, still inadequate and is especially weak with respect to observation wells and to the quality of surface waters that have been seriously polluted in places by municipal and industrial wastes during recent years, especially during the war. The Federal program should be continued and expanded. It will serve not only to supplement the cooperative programs but also to provide a net of observation stations, well distributed throughout the country, that will not be liable to breaks resulting from fluctuations in cooperative funds.

The classification of the public lands of the United States as to mineral and water resources and the supervision of operations for the development of these vital natural resources without waste are functions of the Conservation Branch. This work involves intricate problems of geology, engineering, economics, and administration in complying with legislation enacted by the Congress, which contemplates that these resources shall be developed by private initiative in accordance with wise conservation practices. The activities include field investigations and preparation of reports dealing with water power, fuels, minerals, and chemicals essential to national war and postwar programs.

In carrying out the land-classification functions, Government agencies by administrative arrangement are furnished information concerning undeveloped resource values in the form of special reports concerning individual parcels of land involved in applications for sale, lease, exchange, or other forms of disposal. It is an essential service in the proper administration of Federal land in order to insure appropriate and timely use of such property. Advance determination of economic values also assures proper and adequate return for all disposals of such property and compliance with applicable Federal law. In the avoidance of duplication of such essential services by the numerous Federal agencies having need therefor, it is estimated that a saving of not less than 2 million dollars a year is effected in the costs of land administration. Whenever the information so obtained will be useful for the general public in encouraging development of the resources, reports are prepared for public distribution, and local offices are open for consultation by technical personnel employed by private interests. Such services are of indeterminate value to the general public.

The supervision of operations constitutes a technical service which assures use of sound scientific principles in the development of the resources under supervision. The estimated value of production from all public-land mineral resources under supervision has increased from somewhat more than 69 million dollars in 1935, to a present annual worth of nearly 150 million dollars, and during the same period royalty accruals have increased from 6.75 to 11.64 million dollars a year. The oil, gas, coal, lead, zinc, and other mineral resources under leases supervised by the Branch have a value estimated in excess of 2 billion dollars.

It is expected that discoveries of new deposits during the postwar years will increase the known reserves materially. Proper engineering practices will increase the ultimate economic value of these, probably not less than 50 percent.

GEOLOGIC BRANCH

The Geological Survey is, in a sense, custodian and appraiser of the Nation's mineral wealth. How great that wealth is may be judged from the fact that the aggregate value of all the mineral and mineral-fuel resources produced in the United States up to the end of 1943 was approximately 8 billion dollars. The reserves in the ground that are now known or are being worked are estimated to be worth more than 6 trillion dollars and to that must be added all the yet undiscovered mineral wealth. Until a vast amount of geologic and geophysical investigation and research are done no one can give even a "guesstimate" of the probable value of these total resources. Suffice it to say that 6 trillion dollars plus another large but unknown amount

is staggeringly huge. More than 90 percent of this huge value, however, is locked up in our colossal coal reserves. In other fuels and most metals we are much less well off.

In meeting the requirements for war our Nation has taken a heavy toll of its mineral resources. Of our known commercial reserves, we have depleted 97 percent of our mercury, 78 percent of our chromium, 70 percent of our vanadium, and comparable amounts of manganese, tungsten, zinc, and copper. Our fluorspar resources are being depleted four or five times as fast as in normal times, and peacetime adaptations of wartime uses will cause heavy demands after the war. War requirements have strained available resources of petroleum to the limit, and in some pools reserves in the ground have been endangered by too heavy withdrawals.

Discovery of new deposits can counter this depletion but because the easily discoverable deposits have already been extensively exploited, it will be necessary to expand old techniques of exploration and to develop new ones capable of finding obscure and deeply hidden deposits that have no easily discernible surface manifestations.

Geologic mapping is the first need in the search for hidden deposits of minerals. As the search becomes more intense and more difficult larger-scale geologic surveys are required. At the present time not more than 7 percent of the United States has been mapped geologically on scales adequate to serve the modern discovery program necessary to sustain our industries.

The Geological Survey plans to undertake extensive and systematic geologic surveys of many large areas of the country. These plans call for the utilization of every known refinement in mapping techniques and for the use of the most modern and varied techniques of geophysical exploration. Indeed, because even these will probably fall short of what should be done the Survey plans also to carry out rather elaborate research to discover and develop new geophysical and geochemical methods of exploration and to continue and enlarge its research on the geologic and geochemical factors that determine the localization of mineral and mineral-fuel deposits. Some of the techniques and methods developed by the unit will be of great value in the planning and construction of peacetime engineering projects, such as the selection of airport sites, highway alignments, dam construction, and municipal planning and development. Any large-scale construction project necessarily must be adapted to the geological and soil conditions at the site.

The limit of the Nation's capacity to produce oil efficiently from known fields was reached during the war, and forecasts for the postwar years indicate even greater requirements. This emphasizes the necessity for an accelerated rate of discovery. Geologic investigations directed toward this end have been conducted vigorously, and success

in finding new sources of petroleum is confidently expected. Nevertheless, prudence demands that we appraise the potentialities of substitutes for liquid petroleum. The oil shales and the low-rank coals, especially those of the Rocky Mountain States, afford a source of substitutes in large quantity, and extensive field investigations of them should be undertaken now.

Expansion and redistribution of industry during the war has created local problems of coal supply requiring special investigations. One of the most pressing of these problems concerns the need for supplies of coking coal to sustain the new steel industry of the Salt Lake Valley, Utah, and of the Pacific coast.

Geologic maps pay extra dividends in appraising surface and underground water resources, in making soil surveys, in planning intelligent soil-conservation programs, and in the planning and execution of large engineering construction projects and reclamation programs.

During 1945 the work of the Geologic Branch was devoted strictly to war projects.

The Military Geology unit, at the request of the Military Intelligence Division, Office of the Chief of Engineers, expanded its terrain studies and also filled requests for more than 50 geologists to be detailed to the theaters of operation on assignments concerned with the preparation of operational intelligence or as scientific consultants in combat zones. Numerous official commendations prove the value of applying scientific methods for predicting terrain conditions in advance of operations.

New sources have been sought for certain rare elements that were needed for secret war projects like the atomic bomb. In addition to extensive field studies new techniques, both for field and laboratory use, have been developed to aid the discovery program. This part of our work is receiving much attention because of the tremendous peacetime implications of harnessing atomic power.

Our work on metallic minerals has emphasized basic geologic studies of the principal ore-producing districts in order to provide a proper foundation for further exploration. Some of this effort has already produced results: At San Manuel, Ariz., the Geological Survey cooperated with the Bureau of Mines in a drilling program that indicated copper reserves of possibly as much as 64 million tons of ore averaging 0.8 to 0.9 percent of copper, which is a small fraction of a percent below the 1.0 to 1.1 percent copper ores worked in large volumes in Utah and Arizona. About 10 million tons of bauxite ore have been added to the known national reserves of about 75 million tons as a result of investigations conducted jointly during the past 4 years by the Geological Survey and Bureau of Mines.

Under the auspices of the State Department and the Interdepartmental Committee for Cultural and Scientific Cooperation, 13 mineral

commodities were investigated cooperatively in Mexico, Cuba, Chile, Brazil, the Dominican Republic, and Haiti. The Geological Survey frequently in the past has been host to representatives of foreign Geological Surveys who have visited this country. More attention should be given to the cultural and scientific benefits that accrue from the visits of foreign scientists here and the visits of our scientists to foreign countries.

ALASKAN BRANCH

During the year the geologic work of the Alaskan Branch was devoted to projects that seemed to promise immediate results in terms of satisfying the war needs of the Nation for certain mineral commodities and supplying direct benefits to the war agencies engaged in activities in Alaska. The intense search for and examination of Alaskan mineral deposits during the war has clearly demonstrated the need for continuing in the postwar period the making of an adequate inventory of Alaska's mineral resources.

The war years have seen a greatly increased public interest in Alaska. The Alaskan Branch in its activities has reflected this interest, and its expanded and pointed war program has illustrated the sound basis for such interest. The field investigations of the twoscore members of its technical staff, during the short seasons imposed by climatic conditions, have resulted in the issuance of a series of reports covering detailed examinations of a large number of mineral deposits, some whose worth was previously undetermined, others whose very existence was uncertain. While few of these deposits have as yet reached the stage of commercial development many stand available as sources of added raw materials should our country face greater or long-continued needs for such mineral commodities. As a result of these relatively limited studies the reserves of many of the war minerals present in the Territory have been substantially increased. For example, quicksilver, formerly considered as a resource of only minor significance, has become one of the important commodities which are now commercially produced in Alaska. The work of the Alaskan Branch geologists has increased known coal reserves by millions of tons. The mining of gold, in peacetime Alaska's major mineral industry, has been seriously curtailed by the war.

Not only has no significant percentage of Alaska's mineral resources been consumed in our war effort, but her mineral wealth is still so slightly tapped that any calculation in terms of dollars and tonnage reserves can be only a rough approximation. The Alaskan Branch, which has never numbered more than 40 geologists and through most of the half century of its life has numbered between 5 and 10 men, has spread its efforts widely over most of Alaska's nearly 600,000 square miles and has accumulated a considerably body of sound and

lasting information, but the task ahead is tremendous. As a result of these activities the known value of Alaska's mineral resources can be set at a minimum of several billions of dollars.

The accelerated war program has been coordinated with the anticipated future development of the Territory. Many of the thousands of servicemen who have passed through or have been stationed in Alaska have become greatly attracted to the Territory. Never again will there be a lack of interest in the Territory. With the growing interest in Alaska are coming increased inquiries as to the possibilities there for newcomers. Information as to Alaska's mineral resources is sought daily from the Alaskan Branch by servicemen, other private citizens, and corporations. As a result of its war program the Branch is better able to reply adequately to such questions than at any time in the past. But to provide complete answers to many of these questions, answers which will enable the questioner to plan his new life satisfactorily, far more is needed. The average postwar settler in Alaska can be helped immeasurably and the development of the Territory on a sound basis expedited if the Alaskan Branch and other Government agencies, each in its respective field, are able to supply the needed answers.

Alaska's development must be based on a sound and enduring economic structure, which has been established with an understanding of the aims and methods of sound conservation, not only for the safeguarding of Alaska's resources for the future but as well to insure the success of its prospective citizens in their varied ventures. One of the prime requisites for the establishment and maintenance of a highly developed civilization is the production and regular revision of a series of large-scale topographic maps of high detail and accuracy. The most efficient development of any area is impossible without the careful study of such maps. The most desirable locations for town sites, highways, reservoirs, airports, and a myriad of other works of man require at least initially a careful examination of detailed topographic maps. As a result of its work for the Army Air Forces, small-scale aeronautical pilotage charts have been completed by the Branch for the greater part of the Territory, but these, while they will serve as a springboard for future mapping activity, are inadequate to meet the demands of a developing civilization. Less than 1 percent of Alaska has been mapped in the detail and accuracy considered essential for areas of only moderate development in the United States.

With the production of such detailed maps should come a greater intensification of diversified geological examinations. Before the war the emphasis was placed on investigations contributory to the production of gold, during the war it was placed on the development of minerals essential to the war program, and now the postwar emphasis must be on a diversified mineral production. The development of

deposits of nonmetallic mineral commodities, such as limestone, gypsum, marble, and other building stones, and clay, gravel, and sand may make important contributions to the establishment of a sound and stable society in Alaska. Alaska's fuels, her coal and perhaps her petroleum, may prove sufficient when adequately developed to satisfy not only her own needs but to sustain a considerable "export" trade as well. Many of these materials or their finished products are being shipped to Alaska today when Alaskan reserves, as yet practically undented, may be able to offer the same or better materials with lower costs and greater efficiency. Along with its postwar development of such mineral resources the Branch must continue at an increased tempo the delimitation of areas in which the production of metallic minerals is, or may become, possible. It is the duty of the Alaskan Branch to provide the basic information necessary for the continuation, expansion, and greater diversification of Alaska's mineral industry.

During the field season of 1944, which included the latter part of the fiscal year 1944 and the early part of the fiscal year 1945, the Alaskan Branch, through its regularly appropriated funds, carried out 15 specific projects and 4 supervisory projects, the majority of which were devoted to petroleum, coal, quicksilver, copper, tin, and zinc investigations.

The program for the field season of 1945 has been influenced in compliance with the needs of certain units of the War and Navy Departments. In the latter part of the fiscal year 1945 about two-thirds of the technical geologic personnel of the Alaskan Branch of the Geological Survey were engaged on projects designed to meet these needs. In addition six projects relating to mineral commodities for which there was an acute demand to meet war needs were in progress at the close of the fiscal year 1945.

A major activity of the Alaskan Branch throughout the fiscal year has continued to be the compilation of aeronautical pilotage maps and charts from photographs furnished by the Army Air Forces, and financed with funds transferred to the Geological Survey from the Air Forces.

During the 1945 fiscal year 3 bulletins were published, 8 preliminary mimeographed reports on strategic and critical mineral investigations, 7 press releases embodying technical information and designed to take the place of preliminary reports pending regular printing of the results, 1 geologic and topographic map accompanied by a brief report, and 12 other press releases were issued.

TOPOGRAPHIC BRANCH

The headquarters offices of the Topographic Branch and the Atlantic Division are in Washington, D. C.; the headquarters office of the Central Division is in Rolla, Mo.; and that of the Pacific

Division is in Sacramento, Calif. Section offices are maintained in Chattanooga, Tenn., and Arlington, Va.

General Office Work

The major part of the year's activities of the Topographic Branch was directed toward producing maps in manuscript form from aerial photographs made for the War Department. Approximately 80 percent of the time and services of the personnel of the Arlington, Va., and Chattanooga, Tenn., groups was devoted to the mapping or supervision of mapping of areas in foreign countries for use of the Armed Forces. In all, 64,084 square miles were mapped by these facilities, of which 59,810 square miles were completed before VE-day.

Of the domestic maps published during the year, 183 were within the strategic areas designated by the War Department, thus increasing to 586 maps the total published of those areas since the declaration of war.

Section of computing.—Processing field notes of geodetic control surveys is the primary function of this section. The listed results are required by topographers and geologists in subsequent mapping processes of the Geological Survey. They are furnished regularly to the War Department, and, upon request, to other governmental organizations. As a public service, data for limited areas are available to geophysical prospectors, civil engineers, and surveyors throughout the United States. During the year lists for 374 quadrangle-map areas were issued in lithographed form, and many others were prepared as typewritten manuscript.

The section is engaged in occasional tests of field instruments and researches into computing methods. Instructions are prepared for the technical procedures used in both field work and office processing of leveling, transit traverse, and triangulation.

Section of photomapping.—The principal work of this section is the production of topographic maps from aerial photographs by stereophotogrammetric methods and the production of planimetric maps and planimetric bases for topographic field surveys by both stereophotogrammetric and graphic methods.

Topographic maps of areas in the United States produced during the year by these methods covered approximately 6,280 square miles; planimetric and base maps covered an area of approximately 8,688 square miles. Topographic maps of foreign areas were produced in manuscript form from aerial photographs for the War Department of an area of approximately 35,734 square miles. In addition, Geological Survey personnel working in cooperation with the Tennessee Valley Authority either completed or supervised additional foreign mapping for the War Department in the amount of 28,350 square miles.

At the principal office of the section, in Arlington, Va., in addition to the large production facilities, which are operating on a two-shift basis, there are also maintained a central laboratory for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment utilized for stereophotogrammetric work and a photographic laboratory specializing on research and precision photography required for the other offices.

The Washington office maintains a general file of aerial photographs utilized in the work of the Geological Survey and of aerial photographic negatives that have been purchased under photographic contracts. Through this office contacts are maintained with other governmental agencies involved in aerial photographic work.

Section of cartography.—Work on the International Map of the World on a scale of 1:1,000,000 was continued. Sheets H-14 (Austin); H-15 (Mississippi Delta); I-17 (Savannah); I-18 (Hatteras); (K-10 (Mount Shasta); K-17 (Lake Erie); and L-10 (Cascade Range) were in progress, and sheet K-16 (Chicago) was in course of publication at the end of the year.

The preparation of the transportation map for the Public Roads Administration was continued. Compiling, inking, lettering, and editing was in progress for the States of Louisiana, Nevada, North Carolina, Ohio, and West Virginia. Fourteen sheets in New Mexico were published; 33 sheets in Texas are in course of publication; and 8 sheets in North Carolina were transmitted for publication.

The Columbia River Basin maps for the International Columbia River Engineering Board as well as other special maps were prepared for publication.

Section of inspection and editing.—During the year 249 quadrangle maps were edited for publication, 175 of which were for multicolor photolithography and 74 for engraving; 376 quadrangle maps, 15 State maps, and 10 State index maps were prepared and edited for reprint editions; 112 maps and diagrams that had been prepared as illustrations for geologic reports were edited; and 392 proofs of all kinds were read. On June 30 maps in the process of reproduction included 85 for engraving and 79 for multicolor photolithography; maps being edited or awaiting editing included 32 maps for engraving and 59 for multicolor photolithography; and 292 maps remained on hand for preparation for reprinting.

The Section of Inspection and Editing maintains in Arlington, Va., a small unit to draft maps produced by the Atlantic Division.

Map Information Office

The Map Information Office continued its work as clearing agency for data pertaining to maps and aerial photographs of both Federal and commercial agencies. The office maintains extensive card-index

and map files and is equipped to furnish data to Federal and State institutions and to the public.

Field Surveys

Topographic mapping was carried on in 35 States. Cooperative projects were conducted with 19 States and with the Tennessee Valley Authority.

Topographic mapping by the Geological Survey in the United States, Puerto Rico, and Hawaii, to June 30, 1945

State	Area mapped during fiscal year 1945 for publication on standard scales, contour intervals from 1 to 50 feet (square miles)				Total area mapped to June 30, 1945 (square miles)	Percentage of total area of State mapped to June 30, 1945	Control, fiscal year 1945

¹ Planimetric maps covering 1,638 square miles in Wisconsin, not included in total surveys, were compiled from aerial photographs with field examination.

The mapping of forty-three 15-minute quadrangles and ninety-six 7½-minute quadrangles was completed and mapping was in progress on forty-two 15-minute quadrangles and thirty-nine 7½-minute quadrangles at the end of the year. In addition, work on 132 quadrangles was progressing in some one of the steps prior to actual mapping. Of the 139 quadrangles completed and the 81 partly completed, 116 are within the strategic area designated by the War Department. For use in the investigation of strategic and critical minerals, including iron, copper, bauxite, alunite, high-aluminum clay, manganese, and zinc, 9 special projects were completed and 1 was in progress.

Mapping was accomplished on 16 projects in several States for the Army Engineers, War Department, for flood control. For the irrigation and reclamation of lands, 5 large-scale maps were in progress for the Bureau of Reclamation. The survey of the Olympic National Park in the State of Washington was continued.

Of the total area of the United States, 47.7 percent has now been covered by topographic maps produced by the Geological Survey.

WATER RESOURCES BRANCH

The Water Resources Branch collects and publishes basic information on the conditions and uses of surface water and ground water in all parts of the country. A widely scattered field force is needed for this work. About 100 field headquarters are maintained in which experienced men familiar with local problems related to water are available. Such decentralization serves well the purposes of cooperation, as close contact is thereby maintained between the Survey personnel and cooperating State and municipal officials, and information is available currently where urgently needed. During the emergency of war and now in preparing for peace the decentralization of the Survey's field forces has been especially valuable, because men who are specialists not only in water problems but also in local problems have been available in all parts of the country to conduct special field investigations and to furnish information promptly and efficiently.

Cooperation With States and Municipalities

States and municipalities provided more than a third of the funds for the Survey's water investigations during the fiscal year 1945. The amounts contributed for cooperation in each State are summarized below:

State:	Contribution	State—Continued	Contribution
Alabama.....	\$15, 000	New Hampshire.....	\$9, 208
Arizona.....	30, 900	New Jersey.....	23, 550
Arkansas.....	11, 250	New Mexico.....	41, 850
California.....	90, 730	New York.....	83, 378
Colorado.....	32, 550	North Carolina.....	24, 500
Connecticut.....	11, 430	North Dakota.....	13, 900
Delaware.....	2, 050	Ohio.....	29, 751
Florida.....	40, 620	Oklahoma.....	26, 130
Georgia.....	17, 200	Oregon.....	26, 075
Idaho.....	28, 050	Pennsylvania.....	41, 800
Illinois.....	15, 090	Rhode Island.....	2, 950
Indiana.....	26, 400	South Carolina.....	9, 050
Iowa.....	27, 745	South Dakota.....	4, 550
Kansas.....	35, 540	Tennessee.....	22, 100
Kentucky.....	25, 900	Texas.....	64, 300
Louisiana.....	31, 750	Utah.....	25, 908
Maine.....	7, 500	Vermont.....	6, 260
Maryland.....	16, 975	Virginia.....	33, 800
Massachusetts.....	17, 246	Washington.....	55, 587
Michigan.....	31, 375	West Virginia.....	9, 300
Minnesota.....	15, 790	Wisconsin.....	9, 388
Mississippi.....	15, 000	Wyoming.....	21, 200
Missouri.....	13, 055	Hawaii.....	43, 947
Montana.....	13, 810		
Nebraska.....	27, 520		
Nevada.....	10, 000		
		Total.....	1, 238, 956

Activities Carried on for Other Federal Agencies

Other Federal agencies provided about \$970,000 for water investigations that could not be financed by appropriated funds of the Geological Survey or included in cooperative programs. These agencies are the Office of the Chief of Engineers and the Mississippi River Commission, War Department; Bureau of Yards and Docks, Navy Department; Tennessee Valley Authority; Weather Bureau, Department of Commerce; Bureau of Reclamation, Fish and Wildlife Service, National Park Service, Office of Indian Affairs, Office of Land Utilization, and Bonneville Power Administration, Department of the Interior; Department of State; Defense Plant Corporation; Federal Power Commission; Federal Works Agency; War Production Board; Foreign Economic Administration; and Bureau of Prisons, Department of Justice.

War and Postwar Activities

Throughout the war the Geological Survey operated in an unusual degree as a consulting agency on matters related to the availability and chemical quality of water for war activities of all kinds. This service was based on the Survey's collection of essential facts gathered

over many years by means of both regular and special programs of investigation.

During the 4 years, July 1, 1941, to June 30, 1945, the Geological Survey made more than 15,000 special reports on water at the request of war agencies. Of these, 4,225 were made in the fiscal year 1945. There is no basis for exact estimates of the value of these reports. Many of them have given assurance of the adequacy of available water supplies and so have led to sound and efficient developments; adverse reports have prevented unwise development and waste of money in inefficient or useless construction. Some of the reports have certainly been worth many hundreds of thousands or even millions of dollars; others may have been worth not more than \$50, but assuming conservatively an average value of \$1,000 each, the over-all value of the 15,000 special reports has been at least 10 to 20 million dollars.

Other significant values of the service of the Geological Survey in relation to water are indicated by the fact that Federal agencies have for several years transferred to the Geological Survey nearly \$1,000,000 annually for special water investigations made in addition to the continuing programs conducted in cooperation with States and municipalities. No estimate has been attempted of the great value to private and corporate industry and to the general public. The values of water facts during the years of war are illustrative of even greater values in the many years of peace, when supplies will be more fully utilized and need for knowledge of them becomes more critical.

Continuing Activities

The operations of the Water Resources Branch have been conducted by five administrative divisions—surface water, ground water, quality of water, utilization of water, and power resources.

Records of the stage, quantity, and availability of surface waters are collected through 65 field offices at about 5,600 gaging stations distributed through every State and Hawaii, the number of stations depending largely upon the funds made available by 166 cooperating State and municipal agencies and by transfer from other Federal agencies.

The investigations of ground water relate to the water from which wells and springs are supplied. Investigations in nearly every State and Hawaii are conducted through 38 field offices and in cooperation with 74 State and municipal agencies. During the year, periodic measurements of water levels or artesian pressure were made in about 7,000 observation wells. Observations were continued to determine the depletion caused by the numerous war industries and other war establishments and to provide against possible shortages. Attention was also given to natural and artificial replenishment of the ground-

water supplies, and to their maximum utilization for the many prospective postwar demands. The war has caused heavy overdrafts on ground-water storage at many places. Data are not available for computing this overdraft exactly, but it may be as much as a few hundred billion gallons.

Chemical analyses of 2,048 samples of water were made in the Water Resources laboratory in Washington, and analyses of 4,867 samples were made in laboratories in Safford, Ariz.; Albuquerque, N. Mex.; Raleigh, N. C.; Stillwater, Okla.; and Austin, Tex. Many samples were collected in connection with studies of water supplies for Army and Navy establishments and for munition plants and housing developments. Cooperative studies of the chemical character of surface waters were started in Pennsylvania and Virginia and were continued in Florida, Georgia, Louisiana, New Mexico, North Carolina, and Texas. Samples were analyzed for cooperative studies of ground waters in other States. Interpretations of analyses or advice about water problems were furnished to other Federal departments and to independent agencies.

A variety of hydrologic and hydraulic studies and compilations were made on the utilization and control of streams, and the Water Resources Review, a monthly summary of stream-flow and ground-water conditions in this country and Canada was issued. The administration of certain features of permits and licenses of the Federal Power Commission has been continued. Investigations of water problems along the international boundary between the United States and Canada have been continued for the State Department and the International Joint Commission. After the death of A. H. Horton, for many years its Chief, the Division of Power Resources was discontinued as of March 31, 1945, and its functions transferred to the Division of Water Utilization.

CONSERVATION BRANCH

The classification of the public lands of the United States as to mineral and water resources and the supervision of operations for the development of these vital natural resources without waste are functions of the Conservation Branch. This work involves intricate problems of geology, engineering, economics, and administration in complying with legislation enacted by the Congress, which contemplates that these resources shall be developed by private initiative in accordance with wise conservation practices. The activities include field investigations and preparation of reports dealing with water power, fuels, minerals, and chemicals essential to national war and postwar programs.

Classification of Lands

Mineral classification.—The Mineral Classification Division, in response to war-engendered demand for new sources of oil, gas, coal, potassium, and magnesium from the public domain, continued and increased markedly all phases of its service during 1945.

In all, 13,079 cases were acted on during the year, an increase of 20 percent over 1944. Initial or revised definitions of the known geologic structure of 7 producing oil or gas fields were prepared and promulgated; geologic appraisal was made of 80 unit-plan submissions; and 53 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to Federal lands, including 22 applications for the royalty benefits accorded by the act approved December 24, 1942 (56 Stat. 1080), for the discovery of new oil and gas fields or deposits during the national war emergency.

The Division established during the year a sixth regional field office with a resident geologist in charge at Tulsa, Okla.

Water and power classification.—The work of obtaining basic information concerning the water-power resources and storage possibilities of Federal lands was on projects proposed for development to assist in the prosecution of the war or for postwar construction. Topographic surveys were made of 147 linear miles of streams including 8 dam sites. In cooperation with the Water Resources Branch, supervision of construction and operation was given to 163 power projects under license from the Federal Power Commission, to 212 such projects under permit and grant from the Department of the Interior, and to 157 in cooperation with the Office of Indian Affairs.

Office activity resulted in the addition of 110,278 acres to power-site reserves and the elimination of 7,929 acres, increasing the outstanding reserves in 22 States and Alaska to a net total of 6,774,297 acres; in the publication of maps of 180 miles of stream valley and 18 dam sites; in final action involving hydraulic determination on 267 cases received for report from departmental sources and the Federal Power Commission, and in water-power classification on 1,939 cases, which also involved mineral classification. Reservoir-site reserves in 9 States remain unchanged at 137,172 acres.

Mineral Lease Supervision

Mine supervision.—The Mining Division supervises operations for the discovery and production of coal, potash, phosphate, sodium, silica sand, sulfur, and oil shale on public lands; of gold, silver, mercury, and quartz on various land grants; and of all minerals except oil and gas on tribal and restricted allotted Indian lands. The total output of such minerals from Indian and public land was valued at more than \$66,000,000 during 1945. The Division serves as consultant to the Department of Agriculture on mining leases under the jurisdiction of

that Department and also supervises production of minerals from public lands by the Metals Reserve and the Defense Plant Corporation. The supervisory work involved on June 30, 1945, 572 public-land properties under lease, permit, and license; 235 Indian properties under lease or permit in 14 States and Alaska; and 3 secretarial authorizations in 3 States.

The Division cooperated with the Departments of War, Justice, and Agriculture, other bureaus of the Department of the Interior, the War Production Board, the Reconstruction Finance Corporation, the Defense Plant Corporation, and Smaller War Plants Corporation by furnishing information on potential sources of minerals necessary to the successful prosecution of the war.

The production of potash was maintained at a high level during the year, with continued diminution of known high-grade ore reserves on public lands in New Mexico. Test holes drilled cooperatively by the Geological Survey and the Bureau of Mines in and adjacent to the potash reserve created by Executive Order 6797 indicated that the reserve contains several million tons of high-grade potash ore. Prospect drilling by the three large operating companies in advance of mine development disclosed additional high-grade reserves.

The increasing demand for fertilizer materials, because of the need for increased food production, has intensified interest in the development of phosphate deposits in the western States. During the year one phosphate lease was modified to include additional land and production was begun under two leases previously issued. The suspension of action on the issuance of phosphate leases by Departmental Order 1294, of July 2, 1938, except in particularly meritorious cases, continues in force.

Most of the sodium from the public domain is produced from Searles Lake, Calif., the plants there being operated at maximum capacity, with available labor, to meet the war-induced demand for chemical products used in the manufacture of war materials, such as percussion caps, bombs, flares, shells, smokeless powder, synthetic rubber, armor plate, range finders, bomb sights, and fire-control apparatus. Sodium products are used also as food preservers, water softeners, and refining processes.

Oil and gas supervision.—The Oil and Gas Leasing Division supervises operations for the discovery and production of petroleum, natural gas, natural gasoline, and butane occurring in public lands of the United States, in naval petroleum reserves, and in all Indian lands subject to departmental jurisdiction, both tribal and allotted, except those of the Osage Nation, in Oklahoma. During the year these duties were accomplished through 18 field offices and suboffices in California, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

Four special-study groups were engaged in investigations to aid in secondary recovery operations and other engineering practices necessary to conservation and maximum ultimate recovery of petroleum from public-land leases. During the year studies were completed and preliminary reports prepared on the Buena Vista Front Pool, Calif.; Square Lake and Grayburg fields, N. Mex.; Cole Creek and South Oregon Basin fields, Wyo. A limited supply of mimeographed copies of reports for the Hogshooter and Nowata-Claggett fields in Oklahoma was prepared for public distribution.

On public lands, 7,041 oil and gas properties were under supervision at the end of the fiscal year, aggregating 4,596,053 acres in 20 States and Alaska, an increase of 32 percent in the number of properties and nearly 48 percent in the acreage under supervision at the close of the previous fiscal year.

Drilling on public lands during the year included the spudding of 566 wells and the completion of 626 wells, 440 of which were productive of oil and gas and 186 of which were barren. In all, 11,460 public-land wells, including 6,289 capable of oil and gas production, were under supervision on June 30, 1945. The production from petroleum deposits of the public lands during 1945 was somewhat more than in 1944.

The efforts to fulfill the need for new petroleum reserves were reflected in an increase of 4 in the number of new unit plans approved during the year, the total being 22; 11 unit plans were terminated because all rights thereunder were relinquished or abandoned, leaving 121 approved plans covering 1,421,487 acres outstanding on June 30, 1945. Production under approved unit agreements constituted about 54 percent of the petroleum obtained from public lands during the year, 71 percent of the natural gas, and 80 percent of the gasoline and butane. In addition, two Indian-land unit agreements covering a gross area of 11,685 acres were in effect during the year.

On Indian lands the work of oil and gas lease supervision involved 4,786 leaseholds in 9 States, containing at the end of the year a total of 7,569 wells, 3,987 of which were productive of oil or gas and 146 of which had been completed during the year. Notable increases in production of natural gas and crude oil were reported from the Chickasaw and Choctaw lands in Oklahoma, from the Blackfeet lands in Montana, and from the Shoshone lands in Wyoming. Rentals, royalties, and bonuses accrued from Indian-land operations during the fiscal year are estimated to aggregate \$3,073,728.

On behalf of the Navy Department supervision was continued over operations for the production of oil, gas, gasoline, and butane from 31 properties under lease in Naval Petroleum Reserves Nos. 1 and 2 in California. Production from 312 active wells on this reserve aggregated 3,284,300 barrels of petroleum, 3,584,300,000 cubic feet of

natural gas, and 8,343,300 gallons of natural gasoline and butane, having an aggregate royalty value of \$600,200.

WORK ON PUBLICATIONS

Texts.—The publications in the regular series (professional papers, bulletins, and water-supply papers) issued during the year numbered 38, a decrease from the 49 of last year, again reflecting adjustment to a war-curtailed publication schedule. These publications together with 18 miscellaneous publications issued during the year comprise 7,289 printed pages. Work by the editors included: 6,671 pages of manuscript edited and prepared for printing; 431 galley proofs and 2,955 page proofs revised and returned; indexes prepared for 4 publications, covering 632 pages and consisting of 593 index entries. Copy prepared for mimeographing included 92 press releases, consisting of 147 pages, and 76 pages of miscellaneous material.

Illustrations.—Seventeen reports, containing 403 illustrations, were transmitted to the printer. In addition, 37 maps and sections illustrating deposits of essential strategic minerals were prepared for preliminary release, and 210 proofs and 39 edition prints were examined.

Geologic map editing.—Sixty-five geologic maps and diagrams were completed by the new Section of Geologic Cartography, including multicolor maps of the Comstock Lode district, Nev., and the Gouverneur talc deposits in New York. Copy for the geologic map of Idaho was nearly completed, and the Hollidaysburg-Huntingdon folio was finished. Progress was made on the geologic map of the District of Columbia and vicinity and on the preparation of indexes showing published geologic information on each of the 48 States.

In addition to the maps prepared by the Section of Geologic Cartography, the geologic map editor examined and checked 63 maps and figures drafted by the Section of Illustrations for water-supply papers and 70 maps and figures for professional papers and bulletins.

Distribution.—The Division of Distribution received during the year a total of 852 publications, comprising 40 new books and pamphlets and one special reprint of Water-Supply Paper 888 for official use only, 35 preliminary maps and 9 preliminary charts in the oil and gas and war-minerals investigation series, 253 new or revised topographic and other maps, of which 30 maps were first published as preliminary editions, one Tennessee Valley Authority map with contours, 474 reprinted topographic and other maps, and 9 reprinted advance sheets. The total units of all publications received numbered 74,226 books and pamphlets, plus 1,000 copies of the reprint, 14,500 copies of revised index maps, and 2,308,005 topographic and other maps, a grand total of 2,396,731. The division distributed 72,154 books and pamphlets, 722 geologic folios, and 1,155,548 maps,

making a grand total of 1,228,424, of which 678 folios and 1,001,194 maps were sold. The net proceeds (gross collections less copying fees and amounts refunded) from the sales of publications were \$56,608.20, including \$56,425 for topographic and geologic maps and \$183.20 for geologic folios. In addition to this, \$20,923.59 was repaid by other establishments of the Federal Government at whose request maps or folios were furnished. The total net receipts, therefore, were \$77,-531.79.

Division of map reproduction.—During the year 80 newly engraved topographic maps, 161 multicolor topographic maps, 44 geologic preliminary maps, and 12 special maps were printed, making a total of 297 new maps printed and delivered. Reprint editions of 393 engraved topographic maps, 8 multicolor maps, and 73 photolithographed State geologic and preliminary and other maps were printed and delivered. Of new and reprinted maps, 771 different editions, amounting to 2,322,779 copies, were delivered. A large amount of work was done for 69 other units of the Government, including branches of the Geological Survey and States, and the charges for it amounted to about \$177,000, for which the appropriation for engraving and printing geologic and topographic maps was reimbursed. Transfer impressions and velox prints, numbering 61, were made during the year, and the amount turned over to miscellaneous receipts was \$1,129.10. Topographic maps and contract and miscellaneous work of all kinds, totaling 4,776,814 copies, were printed and delivered. The photographic laboratory made 9,647 negatives, 28,673 prints, 3,872 photolith press plates, 238 intaglio etchings, 2 celluloid transfers, and mounted 1,448 prints.

LIBRARY

The work of the library during the year was again directed principally toward providing reference material for the war activities of the Geological Survey. The Military Geology unit with a corps of bibliographic aids used the library to the maximum in making a compilation of strategic engineering studies. The total number of readers was 12,000. The total circulation of books, pamphlets, periodicals, and maps was 65,600. Acquisitions of books and serial parts again declined in number to 10,806. More than 6,000 maps were acquired, approximately 5,000 from the Army Map Service. A number of German scientific books and periodicals, chiefly in the fields of physics and chemistry, have been purchased in reproduction through the authority of the Alien Property Custodian. The lesser number of geologic items on the market enabled the library to expend a larger portion of its book funds in building up its collection in chemistry and physics, which was inadequate in many phases of recent research touching on the work of the Geological Survey.

Other purchases reflect the emphasis on engineering geology. The Bibliography of North American Geology, 1942-43 is in press.

FIELD EQUIPMENT

Among the more unusual devices made during the past year by the Division of Field Equipment are the following:

A graph subdivider, which is used to convert graphical records of the gage heights of rivers into figures representing the daily mean discharge of such rivers.

A tick graduator, which is used for precisely dividing the distances between degree lines on map grids into 60 equal parts representing minutes and cutting the graduations ("ticks") through the photographic emulsion on glass plates.

An attachment for aerial continuous strip cameras whereby distortions in the photograph such as caused by the tilting and dipping of the airplane are largely eliminated.

A stereo plotter, which is used to plot onto maps contour lines derived by the floating dot method from vertical aerial photographs.

The devices are offering many advantages in their respective fields of stream gaging, mapping, and geologic investigations.

FUNDS

During the fiscal year 1945 there was available for expenditures under the direction of the Geological Survey a total of \$12,598,873. Of this amount \$6,364,160 was appropriated directly to the Geological Survey, and \$6,234,713 was made available by other Federal agencies and by States and their political subdivisions. In addition, \$11,800 was allotted from the appropriation for contingent expenses of the Department of the Interior for miscellaneous supplies.

Solid Fuels Administration for War

C. J. POTTER, *Deputy Administrator*

DESPITE most difficult wartime problems affecting the production and distribution of coal during the past fiscal year, the American mining industry, backed by the Solid Fuels Administration for War, supplied the tremendous quantities required by war plants to turn out munitions and equipment to crush Nazi Germany and speed the defeat of Japan.

At the same time, the public, although pinched at times by winter emergencies and often having to use substitute fuels, has had enough coal to keep healthfully warm, if not always comfortable, and to maintain the wartime civilian economy at the highest level of any nation.

This is an achievement of which those who shared in it can be justifiably proud. It reflected the successful solution of many perplexing problems. It was the result of careful planning and control by the Solid Fuels Administration for War, of hard work and good management by the miners and the operators, and of cooperation between Government and industry. The coal industry performed an excellent war job.

The need for the careful, centralized planning of distribution, with adequate controls, was recognized early in the war. These activities comprised the primary function of this agency. Requirements were forecast a year ahead, production was estimated in advance, and basic distribution patterns were thus established. Industry representatives were consulted extensively in the formulation of plans and programs. The success of the entire war fuel program rested in large part, on their cooperation. Controls and regulations were kept at a minimum, and industry was given the widest possible latitude. The Administration's controls modified normal distribution as little as possible. Modifications were required in fulfillment of the objective of doing everything helpful to early and successful termination of the war.

Under such a program, producers and industrial consumers alike could schedule their operations intelligently. Sound planning revealed probable difficulties in sufficient time to permit appropriate counter measures to be taken. Of course, all conditions could not be foreseen. Particular situations arose which required emergency handling—

Solid Fuels Administration for War

C. J. POTTER, *Deputy Administrator*

DESPITE most difficult wartime problems affecting the production and distribution of coal during the past fiscal year, the American mining industry, backed by the Solid Fuels Administration for War, supplied the tremendous quantities required by war plants to turn out munitions and equipment to crush Nazi Germany and speed the defeat of Japan.

At the same time, the public, although pinched at times by winter emergencies and often having to use substitute fuels, has had enough coal to keep healthfully warm, if not always comfortable, and to maintain the wartime civilian economy at the highest level of any nation.

This is an achievement of which those who shared in it can be justifiably proud. It reflected the successful solution of many perplexing problems. It was the result of careful planning and control by the Solid Fuels Administration for War, of hard work and good management by the miners and the operators, and of cooperation between Government and industry. The coal industry performed an excellent war job.

The need for the careful, centralized planning of distribution, with adequate controls, was recognized early in the war. These activities comprised the primary function of this agency. Requirements were forecast a year ahead, production was estimated in advance, and basic distribution patterns were thus established. Industry representatives were consulted extensively in the formulation of plans and programs. The success of the entire war fuel program rested in large part, on their cooperation. Controls and regulations were kept at a minimum, and industry was given the widest possible latitude. The Administration's controls modified normal distribution as little as possible. Modifications were required in fulfillment of the objective of doing everything helpful to early and successful termination of the war.

Under such a program, producers and industrial consumers alike could schedule their operations intelligently. Sound planning revealed probable difficulties in sufficient time to permit appropriate counter measures to be taken. Of course, all conditions could not be foreseen. Particular situations arose which required emergency handling—

DESPITE most difficult wartime problems affecting the production and distribution of coal during the past fiscal year, the American mining industry, backed by the Solid Fuels Administration for War, supplied the tremendous quantities required by war plants to turn out munitions and equipment to crush Nazi Germany and speed the defeat of Japan.

At the same time, the public, although pinched at times by winter emergencies and often having to use substitute fuels, has had enough coal to keep healthfully warm, if not always comfortable, and to maintain the wartime civilian economy at the highest level of any nation.

This is an achievement of which those who shared in it can be justifiably proud. It reflected the successful solution of many perplexing problems. It was the result of careful planning and control by the Solid Fuels Administration for War, of hard work and good management by the miners and the operators, and of cooperation between Government and industry. The coal industry performed an excellent war job.

The need for the careful, centralized planning of distribution, with adequate controls, was recognized early in the war. These activities comprised the primary function of this agency. Requirements were forecast a year ahead, production was estimated in advance, and basic distribution patterns were thus established. Industry representatives were consulted extensively in the formulation of plans and programs. The success of the entire war fuel program rested in large part, on their cooperation. Controls and regulations were kept at a minimum, and industry was given the widest possible latitude. The Administration's controls modified normal distribution as little as possible. Modifications were required in fulfillment of the objective of doing everything helpful to early and successful termination of the war.

Under such a program, producers and industrial consumers alike could schedule their operations intelligently. Sound planning revealed probable difficulties in sufficient time to permit appropriate counter measures to be taken. Of course, all conditions could not be foreseen. Particular situations arose which required emergency handling—

including snowstorms, floods, fires, sudden changes in war needs and many other developments. But the over-all job of planning made it possible for such problems to be met with a minimum adverse effect on the general fuel supply and its distribution.

Even with many hard-won fuel battles of the war safely behind us, June 30, 1945, a difficult fuel situation still existed. Germany's defeat did not diminish requirements appreciably, and the mines, which had been steadily losing manpower to the armed forces, to other industries and because of natural attrition, no longer had sufficient men to produce all the coal needed. Stockpiles, built up to unprecedented heights under Government leadership early in the war, no longer were adequate to tide the Nation over a serious production deficit.

In the United States, the solid fuels issue lay not in the lack of coal underground but principally in the steady loss of mine manpower. The heavy wartime drain, however, did accelerate depletion of the reserves of high-grade metallurgical and special-purpose coals, leaving nearer the time when the problem of their exhaustion must be met.

SOLID FUELS REQUIREMENTS

Because of the heavy pressure of war industrial demands and the increased financial ability of the domestic consumer to buy more fuel, soft coal requirements reached an all time peak of 626,000,000 tons during the fuel year which ended on March 31, 1945. This far outstripped peak requirements of World War I by about 73,000,000 tons, although the situation is not entirely comparable as an index of recent wartime fuel needs, due to the great increase in fuel consumption and the greater availability of other fuels during World War II.

Requirement figures for the new fuel year, beginning April 1, 1945, were initially placed at 600,000,000 tons, assuming that the war with Japan continued, reflecting anticipation of some decrease in industrial consumption under that of the 1944-45 fuel year and a 20 per cent curtailment in the consumption of the eastern (districts 1, 2, 3, 4, 7, 8, and 13) coals by households and other domestic users.

The fall of Germany caused little further downward revision of these estimates because war production needs for the defeat of Japan continued high.

The war caused shifts on the fuel front which made it necessary for the anthracite industry to take on an unexpected burden of a large number of new consumers when supplies of fuel oil, wood, and gas became short. Total hard coal requirements were estimated at 66,100,000 tons for the 1944-45 fuel year and the figure was increased to 67,000,000 tons for the 1945-46 fuel year. (The 67,000,000 tons

production would be required to supply the needed volume of domestic sizes.)

Byproduct coke requirements were high in the early part of the past fiscal year because of the continuing demands for manufacturing pig iron and steel. This placed a burden on anthracite in certain areas.

Industrial requirements decreased, however, from September 1944 to May 1945, due to general expectations of an early end to the war in Europe.

During the fuel year which ended March 31, 1945, approximately 60,372,821 tons of byproduct coke were shipped to industries requiring that fuel. The movement of byproduct coke to domestic consumers was estimated at 6,407,900 tons. Reclaimed beehive coke provided as an alternative fuel for consumers of scarce solid fuels during the year totaled 713,000 tons, and rescreened byproduct coke, 147,000 tons.

PRODUCTION—MANPOWER SITUATION

Bituminous coal production in the calendar year 1944 was the largest of all time, totaling 620,000,000 tons. Production in the fuel year ending March 31, 1945, dropped to 610,000,000 tons, or about 10,000,000 tons below requirements, and estimates for the 1945-46 fuel year point to a maximum output of some 575,000,000 tons.

Production of anthracite in the 1944-45 fuel year totaled approximately 61,287,000 tons. Indications are that hard coal production in the 1945-46 fuel year will not exceed 55,000,000 tons.

The coal production problem, reduced to its simplest terms, was inadequate manpower aggravated by strikes. On April 1, 1945, an estimated 378,000 workers were employed at bituminous mines, the lowest figure in 43 years. Anthracite employment was put at 72,000, the lowest since the early days of that industry.

Trends at the start of the 1945-46 fuel year indicated that bituminous mine manpower would decrease an additional 19,000 before the end of that year, due largely to accidents, deaths, and retirements. In the anthracite mines, a further net loss of some 3,000 workers was expected.

The Solid Fuels Administration appealed vigorously but unsuccessfully for the release of adequate manpower from 30,000 younger mine workers in military service. By agreement with the Selective Service System, draft deferments were obtained for some 27,000 mine workers during the past fiscal year.

Recurrent strikes throughout much of the 1944-45 fuel year further retarded coal production. A strike which started July 3, 1944, at the anthracite mining properties of the Philadelphia and Reading Coal & Iron Co., near Shenandoah, Pa., cost consumers 500,000 tons of hard coal before it was terminated on August 23 after the Government took

possession. These properties were operated under Government possession until April 18, 1945, when they were returned to the owners.

Fostering increased mine output by every possible means, the Solid Fuels Administration for War assisted the industry in carrying out various incentive programs. In addition the Administration assisted mine operators in obtaining new equipment to replace worn out tools and machinery. The Administration aided in having roads constructed to new mine pits and stripping operations and helped retail dealers obtain tires for their trucks. Successful representations were made to the Office of Price Administration to obtain larger supplies of meat for mine workers, many of whom complained that they were unable to continue their work without increased rations.

COOPERATION IN LABOR MATTERS

Production in bituminous coal mines suffered heavily in August and September 1944 because of a wave of so-called "supervisory" employee strikes. These started in the northern Appalachian mining districts and spread south, affecting principally the mines producing vitally needed special-purpose coals. In order to restore production, it was necessary for the Government to take possession of 72 mining properties, which remained under its control until February 24, 1945.

In the spring of 1945, the Secretary of the Interior, at the direction of the President, took possession of 272 soft coal operations and 354 anthracite companies to minimize losses of production due to strikes attending a break-down in wage negotiations. Possession of the mines was administered by the Solid Fuels Administrator for War until after the wage controversies were settled. When anthracite wage negotiations became stalemated, Secretary Ickes called the opposing parties together and suggested a basis for further consultations which resulted in an agreement. With these matters settled, all but a small number of mines that had been taken over by the Government subsequently were returned to their owners.

Estimated losses of potential production due directly to strikes in the 1944-45 fuel year were 13,835,000 tons of bituminous coal and 5,098,000 tons of anthracite.

DISTRIBUTION OF SOLID FUELS

With coal supplies falling behind requirements throughout the fiscal year, it was necessary for the Solid Fuels Administration for War to exercise controls over distribution in order to prevent interruption of vital war industries and hardship to civilians.

On August 1, 1944, retail deliveries of scarce Southern Appalachian bituminous coals were limited to 90 percent of 1943-44 receipts. A

regulation was issued requiring shippers of scarce Southern Appalachian coals to maintain three categories of shipping preferences. The shippers were ordered to fill first the needs for byproduct and special purpose coals, then to fulfill commitments on coal ordered for movement by water during the Great Lakes navigation season to dock operators. Third preference was given to orders from retail dealers.

That regulation also established three "consumer areas," in which priorities were given for shipping the scarce Southern Appalachian coals to retail dealers. Southeastern States which had no alternative source of solid fuels were given first priority. The second area embraced regions receiving their coal by Great Lakes vessels. Midwestern States which have alternative fuels comprised the third consumer area.

The shortage of high grade Appalachian bituminous coals became so acute by August 1944 that the Solid Fuels Administration for War, in order to protect wartime steel production, ordered the diversion of some 1,680,000 tons over a period of several months from industrial plants using it for generating steam to steel and coking plants.

Heavy inroads on Midwestern bituminous coal, coupled with production difficulties occasioned by bad weather, compelled action in December to restrict shipments of fresh-mined coal by producers to industrial consumers in proportion to their stock piles. Many industries which had comparatively large stocks on hand were obliged, therefore, to withdraw from those stocks for day-to-day burning needs to provide more new-mined coal for others whose stocks were being depleted too rapidly for safety.

In January 1945, extremely heavy snowfall hampered rail transportation in many eastern States, making temporary railroad embargoes necessary. Producers in Southern Appalachian mining districts were requested not to ship coal west of Pittsburgh and north of Central Ohio, Indiana, and Illinois during the embargoes because of car shortages. As an emergency measure, retail deliveries also were limited for a short time and diversions of coal in transit were made in order to supply dealers whose yards were nearly empty. The cooperation of local authorities in many cities and towns was obtained in assuring that every one had at least enough solid fuel to prevent acute suffering.

Equitable distribution of anthracite, the primary market for which is among household consumers in the Northeastern and Middle Atlantic States, was carried out successfully in the past fiscal year despite the serious production deficit and numerous delivery handicaps.

A critical emergency was created in fuel distribution by the series of heavy snowstorms which formed ice in many northeastern rail terminals, freezing cars to the rails and coal in the cars. For a time shipping and retail delivering in northern, central, and western New York State was completely disrupted.

At the start of the 1944-45 fuel year, distribution of hard coal from producers and wholesalers was planned on a basis of 90 percent of adjusted 1942-43 base period tonnages. The deficit of production under requirements, however, exceeded earlier estimates, and in August shipments by producers and wholesalers to retail dealers were cut to 87½ percent. In February and March of the fuel year it was necessary to reduce this figure to 80 percent.

Adhering to principles adopted at the beginning of anthracite distribution controls, the Solid Fuels Administration for War continued to make upward adjustments of dealer quotas wherever this was made necessary by population increases, conversions from other fuels and similar changes in requirements.

The Solid Fuels Administration for War assisted the anthracite industry in disposing of some of the excess fine sizes of hard coal which were not suitable for home heating, through the development of new markets. Encouragement was given to manufacturers of processed fuel to use these small sizes and some were shipped abroad as a substitute for fuels normally used.

In the distribution of anthracite in sizes suitable for heating, the Administration gave a preference to poultry brooders and hatcheries because of their essentiality as wartime food producers.

Anthracite production during the 6 months preceding the end of the 1945-46 fuel year fell 19 percent below that of the comparable period of the previous year, and at this time the prospect is that the industry's output will be substantially short of requirements.

Distribution of coke during the past fiscal year was a problem the solution of which lay chiefly in supplying coke plants with adequate tonnages of suitable coals. During the last 3 months of the fiscal year—from April 1 to July 1945—it was necessary to divert byproduct coke from the domestic market to meet the requirements of industrial users. This demand, however, tapered off in the latter part of June, releasing additional supplies for domestic consumption.

Throughout the fiscal year the Solid Fuels Administration for War continuously urged persons using anthracite for heating purposes to accept deliveries of reclaimed coke to supplement short supplies of their customary fuel. Wherever this advice was followed, purchasers were able to stretch their heating fuels farther during the winter months.

Special problems arising in connection with the distribution of solid fuels included providing adequate fuel supplies for regions which normally receive their winter's supplies of coal by water over the Great Lakes shipping routes. Slightly more than 58,000,000 tons of coal were forwarded from lower lake ports during the 1944 navigation season—an all-time record achieved under a regulation of the Solid Fuels Administration for War requiring uniform monthly shipments.

Taking cognizance of the prospect that production during 1945 would continue to decrease, the Solid Fuels Administration for War directed Great Lakes dock operators to inform their suppliers by February 16 of the amounts, grades, and sizes they would require for a year from May 15, 1945. At the same time retail dealers were ordered to supply the dock operators with detailed information as to the needs of their industrial customers. This information formed the basis whereby producers could gauge their shipments during the season of navigation.

Industrial stockpiles were increased during the summer and fall of 1944 from a low of 50,513,000 tons on May 1, to a high of 65,074,000 tons on November 1, but mine manpower shortages and strikes made it impossible to build them up sufficiently to offset the additional winter consumption requirements. From November until the end of the fuel year on March 31, 1945, stockpiles declined again to 45,495,000 tons. This decline continued until May 1, 1945, when stockpiles reached their lowest point of the war—43,793,000 tons. During the remainder of the spring they began to rise again, reaching 47,718,000 tons by the end of the fiscal year.

DISTRIBUTION PROGRAM FOR 1945-46

Serious shortages of solid fuels in prospect early in 1945 compelled thorough revision of the Administration's distribution program. One of the regulations drafted for the 1945-46 fuel year laid the basis for allocations of special purpose coals, protecting them against uses which would tend to handicap the national war effort.

Other outstanding features of the 1945-46 distribution program included: (1) Limitation of dealer quotas for the scarce eastern solid fuels to 80 percent of the dealer's receipts in a base year period; (2) limitation of retail deliveries of anthracite, eastern-mined bituminous coal, coke, and packaged fuels to 80 percent of the consumer's normal annual requirements; (3) giving a third priority on soft coal to be moved to the Great Lakes and stipulating that the lake movement was to be completed by November 17, 1945; (4) continuation of tight controls on industrial coal distribution and stock piling; (5) requiring that "over-the-road" anthracite truckers secure SFAW licenses to assure a more equitable distribution by truck and by rail; and (6) encouraging spring and summer storage of solid fuels by as many consumers as possible under conditions of short supply.

To assure the widest possible spread of solid fuels during the 1945-46 fuel year, the new regulation required consumers using them for heat in all States east of the Mississippi and in certain areas west of that river to file "consumer declarations" with their retail dealers to show how many tons their premises normally required for a year.

A similar method of retail distribution already had been in use by anthracite consumers and had operated successfully in lieu of coupon rationing. Solid fuels consumers who filed the declaration were limited to 80 percent of their normal annual requirements of the scarcer kinds of fuel. Toward the end of the fiscal year this limitation was removed with respect to midwestern-mined soft coal.

Local advisory committees were continued in all States in which fuel was scarce to assist domestic consumers and retail dealers with respect to fuel problems. Provisions were made in regulations whereby the so-called "orphan" consumers were helped to get coal. (These were consumers who were either new in a community or for some other reason had no regular retail supplier.)

WAGE AND PRICE STABILIZATION

Consistent with the responsibility of the Solid Fuels Administration for War to maintain production at the highest possible level within the established stabilization policy, the agency frequently recommended to the Office of Price Administration the establishment of prices for solid fuels that would encourage or protect coal output. In making such recommendations, the Administration reviewed in detail the cost and realization figures where the application for price adjustment affected a complete production district, a production subdistrict, or any considerable group of mines.

On general price revisions or on those affecting mines of large production, the Solid Fuels Administration for War made recommendations to the Director of Economic Stabilization which supplied him with information useful in passing upon recommendations of the Office of Price Administration. Also, in connection with wage stabilization, the Administration furnished data and advice to the War Labor Board.

CONSERVATION OF FUELS

Fuel conservation became an important wartime measure during the fuel year 1944-45. The reduction in supplies made it necessary for householders and industries alike to take vigorous steps to avert fuel waste. It was necessary to convince the public of the need to save fuel through programs of education in methods of accomplishing fuel savings.

Mass educational and promotional procedures were used to obtain the cooperation of the household consumers, while the industrial activities largely consisted of engineering advice, carried on through the National Fuel Efficiency program of the Bureau of Mines.

The part of the program pertaining to household consumers was carried on directly by the Solid Fuels Administration for War, with the

help of State governments in areas where fuel was most critically short, and with the aid of the Office of War Information. The Governors of 25 States in the critical areas appointed State Fuel Conservation Directors who cooperated with the Federal Government in the issuance of information to promote fuel savings. Basic information, and a small amount of educational materials were supplied the states by the Solid Fuels Administration for War, which coordinated State and Federal activities in connection with this program. With the cooperation of the Office of War Information, the Solid Fuels Administration for War carried on a program of public education, employing such media as radio, press, motion pictures, posters, and circulars.

The funds appropriated for public informational activities were exceedingly inadequate as compared to the size and importance of the task, making it necessary for the Solid Fuels Administration for War to appeal to and depend largely upon the expenditures of business organizations and other interested groups. The radio industry and its advertisers devoted broadcasting time freely to fuel messages. Government advertising material was placed in the hands of private business organizations and associations which reproduced and distributed it, or sponsored and paid for its use as commercial advertising by the radio and press.

During the warm months, steps were taken to encourage the public to prepare for winter by ordering and storing whatever fuel was available, cleaning and repairing heating equipment, insulating and otherwise making homes and other buildings "heat tight." During the heating season, more direct conservation measures such as delaying the starting of fires in the fall and extinguishing them early in the spring, preventing overheating, or inefficient furnace firing, were advocated.

COMPLIANCE WITH REGULATIONS

Considerable credit for the generally excellent compliance with wartime fuel regulations is due to the coal industry for its cooperation. The job of distributing fuel fairly could not have been done, however, without the compliance activities of the Administration, important among which were the efforts taken to explain to the trade the regulations and directions by which solid fuels were distributed, their purposes and necessity.

Violations were relatively few, considering the many thousands of producers, distributors, dealers, truckers and consumers affected. In most cases, maldistribution resulting from detected violations was corrected by adjustment of shipping schedules, and in some instances, by the elimination of untrustworthy channels of distribution.

Because there was sufficient coal to supply household consumers with a reduced percentage of their normal requirements, it fell upon Solid Fuels Administration for War to see that they received their full share in tons of the available supply, and that the limited supply was not adversely affected by deliveries of coals containing excessive ash. It was necessary to suspend the operation of some 20 anthracite mines for various periods because fuel containing excessive ash was shipped from them. Violations of all types averaged about 100 per month.¹

¹ The war had ended by the time this report was written. The solid fuels outlook for the 1945-46 fuel year was still clouded, however, by the delayed return of manpower to the mines from the armed services and from employment in war industries in time to make possible the production of adequate coal for all purposes.

In general, the supply of the lower grades of coal appeared adequate, but the Nation was still confronted with a serious shortage of the higher grade bituminous coals produced in the east and of anthracite. It unquestionably will be necessary to continue exercising certain controls over the distribution of solid fuels throughout the 1945-46 fuel year, and for the public to accept alternative fuels wherever preferred types or sizes are not available.

Petroleum Conservation Division

E. B. SWANSON, *Acting Director*

THE Connally "Hot Oil" Act, approved February 22, 1935, delegates to the President prescribed powers "to regulate interstate and foreign commerce in petroleum and its products by prohibiting the shipment in such commerce of petroleum or products moved in excess of amounts allowed by State law and for other purposes."

Acting through the Secretary of the Interior as the designated agent of the President, the Petroleum Conservation Division was established to assist in the prescribed administration of the act, to cooperate with oil and gas producing states in the prevention of waste and the adoption of uniform oil and gas conservation laws, and to keep informed as to the movement in interstate commerce of petroleum and its products with respect to its parity between supply and consumptive demand.

FEDERAL PETROLEUM BOARD

The Federal Petroleum Board with its head office in Kilgore, Tex., and field offices at Lafayette, La.; Corpus Christi, Houston, and Midland, Tex., administers the regulations prescribed under the Connally Act. While the act is applicable to any State having an oil proration law, the supervisory operations of the Federal Petroleum Board are now confined to 106 counties in Texas, two producing counties of New Mexico, and the entire State of Louisiana. Within this area, monthly production reports are not required for "stripper" fields. Eliminating these, the designated area includes 476 oil fields, 19,323 wells, 78 refineries, and 129 gasoline plants. Daily production averages 2,110,604 barrels of oil and 132,599 barrels of casinghead gasoline and other liquids. This is 75.37 percent of the total output for New Mexico, Texas, and Louisiana or 41.96 percent of national output. The refineries process a daily average of 1,679,189 barrels of products. The daily average increase in production, within the designated area, over the fiscal year 1944, is as follows: Barrels of crude oil, 10.2 percent; barrels of petroleum products, 16.1 percent; barrels of casinghead gasoline, 25.6 percent.

Although the Board's area for supervision does not include all territory in which State proration laws are applicable, action can be and is instigated by the Federal Petroleum Board when Connally Act violations occur outside of the supervised area but within a State proration area.

The enforcement of the act and administration of the regulations is essentially a specialized field operation requiring, among other things, routine and special inspections. This function is necessary to maintain effective control over the interstate movement of petroleum and its products. As a result of this control, illegal practices are reduced and a maximum compliance with conservation laws is maintained in oil operations.

Activities of the Federal Petroleum Board have been curtailed by reduction in experienced personnel and by other wartime handicaps. Yet the volume of criminal investigative operations has been maintained at an effective level. Changing economic conditions have reduced the incentive for Connally Act violation and continued supervisory operations have acted as a deterrent. The Board's personnel has been for several months in a position to report on technical and economic conditions within the Board's area.

During the fiscal year J. W. Steele retired as chairman, and member Ray O. Armstrong was appointed chairman.

As of July 1, 1944, there were seven Connally Act cases which had been referred to the Attorney General pending action by the Department of Justice and six major investigations in progress. Evidence had been developed in the six investigations to such an extent as to allow for allegations of Connally Act violation. Of these 13 cases, 4 were prosecuted successfully, and \$12,100 in fines collected. Indictments have been secured in two other cases and they are now ready for trial. The two indictments name two corporations and 21 persons. Civil action involved in three cases has been conducted effectively in the Government's interest and criminal action against respondents has been started. One of the cases in investigative status at the beginning of the fiscal year has been compiled and presented to the Department of Justice, another will be offered shortly. Two of the cases in an investigative status have been closed by administrative action because it was found that prosecution would not be advisable or justified. The thirteenth case remains pending in the Department where it has been for several years awaiting apprehension of the indicted.

On December 1, 1944, by Order No. 2012, the Secretary established a Departmental Petroleum Committee, which consists of the Director of the Geological Survey, Director of the Bureau of Mines, Assistant Commissioner of the General Land Office, Assistant Solicitor and the Director of the Petroleum Conservation Division, as Chairman.

The Committee reviews and coordinates the petroleum work of the several agencies of the Department and makes recommendations to the Secretary as to changes which may be necessary or desirable to increase the effectiveness of the work.

General Land Office

FRED W. JOHNSON, *Commissioner*

POSTWAR administration of public lands roughly estimated as representing nearly a quarter-billion dollars' worth of real estate owned by the American people, is the paramount task confronting the General Land Office at the close of the 1945 fiscal year. Taking into account the intangible assets inherent in the 778 million acres of the public domain in the United States and Alaska and the mineral deposits and other resources in the land, this property is an important factor in national economic advancement during the reconversion period. Its continued management under progressive conservation policies for use and development with an eye to the requirements of the future, is essential. In no other way can the domestic demands for maximum beneficial use of the land and resources of the public domain, adequately be met.

Already, the trend of scientific research has pointed the way to new fields of usefulness for the public domain, broadening the scope of activities in the development of resources beneath the surface and expanding the opportunities for utilization of the land itself. The wider horizons for mineral uses revealed by the discovery and development of atomic energy, the steadily mounting requirements for lumber and other forest products to repair the ravages of war, and the growing demands from ex-servicemen for land settlement opportunities serve to illustrate the trend toward more extensive usage in the years immediately ahead.

Obviously, this contribution to future economic advancement cannot help but enhance the value to the American people of their public domain. However, it will also bring a corresponding increase in the responsibilities facing the General Land Office. New methods and new laws must be provided with which to carry out these new tasks which, in effect, mark the beginning of a new era in national land administration.

ESTIMATE OF VALUE

There is a wide range of fluctuation in the evaluation of land. Current conditions and demands can change such calculations overnight. Who, for instance, can predict with accuracy the worth of areas destined to become homes of future settlers in Alaska, or estimate the ultimate monetary value of mineral-bearing lands? Nevertheless, some idea of the value of the public land is essential to the determination of its worth as a national asset of the United States.

It has been conservatively estimated that the public lands of the United States on the continent and in Alaska represent real estate values aggregating \$235,000,000, of which \$125,000,000 worth is located in the United States. Roughly divided, the assets comprise forest lands and woodlands worth \$160,000,000, grazing lands whose value is conservatively placed at \$30,000,000, and other lands including barren areas as well as areas devoted to special use, valued at \$45,000,000. In addition to this conservative evaluation of the land, technical services rendered by the General Land Office to the public and to agencies of both Federal and State governments constitute other less tangible factors whose value conservatively is estimated to bring the total worth of the people's assets in this real estate to \$250,000,000.

NEW PROBLEMS

Land administration experiences in connection with the prosecution of the war have sharply accentuated the pattern for efficient management of the public domain in time of peace. At the close of the 1945 fiscal year, definite alterations in Federal law and in procedures of the General Land Office were revealed as imperatively needed to bring about that efficiency to which the public is entitled and without which the maximum beneficial use of the national lands and their resources cannot be assured. Some of these needs long had been recognized, but their accomplishment was held in abeyance for the duration of the war. Today, freed from the restrictions arising from the necessity for emergency military action, these problems await solution:

1. Rejuvenation of our Federal mining laws is essential. Mechanized warfare has demonstrated that minerals are indispensable in modern war; under present statutes, no method exists for securing to the United States the utmost advantages from the development of such resources on lands under its control. No real mining conservation, a vital factor in the postwar economy, can be brought about without Federal law granting authority for the United States to supervise the minerals which it owns. Except for statutes governing the development of the fuel and fertilizer minerals in the public lands,

no such authority exists at present. A general leasing system applicable to all minerals would provide the Government with not only the power to conserve but the opportunity to catalog and classify its natural assets to insure their maximum beneficial use during the reconversion period.

2. Legislation is needed to extend the salutary provisions of the present mineral leasing law to lands acquired by the Government, as well as to the original public domain. Specifically, lands acquired by Federal agencies under the National Industrial Recovery Act, the Bankhead-Jones Farm Tenant Act and various relief appropriations and rehabilitation acts, together with the public lands, constitute a veritable storehouse of essential minerals. Without the enactment of new laws, the United States may not catalog and in cooperation with private initiative develop the resources on these acquired lands through leases based on sound principles of conservation.

3. Another element essential to the successful administration of the public domain, both in relation to mineral resource development and the general management of the Federal estate along conservation lines during the postwar period, is complete, authentic information as to the character and status of the land. At the present time, evidence of the filing of thousands of unpatented mining claims is not made a matter of Federal record, but is solely registered in county recording offices. The enactment of legislation to enable the recording of such evidence in the General Land Office is urgently recommended.

4. Similarly, another of the serious handicaps to proper administration of the nation's assets is the lack of any facilities by which detailed information can be secured concerning the real estate holdings of the various branches of the Federal Government. The establishment within the General Land Office of a centralized, consolidated inventory of all such land records is recommended as a solution of this problem.

5. From time to time, areas of the Federal domain have been withdrawn from general use by the public in order that broader programs of national development might be facilitated. A careful survey of these withdrawals should be undertaken, and a reduction in the size of the areas withdrawn be brought about wherever feasible in the public interest. By this means, portions of the hitherto withdrawn lands may be restored to their public land status and the land and its resources made available for more general utilization in the postwar period.

6. A reexamination of the public lands to discover whether any tracts hitherto overlooked may be suitable for homestead use by veterans or the general public, is suggested as an appropriate part of

any program for the maximum beneficial use of the natural resources of the Nation.

7. Similarly, a thoroughgoing study of the statutes and administrative procedures for homesteading on the public domain should be undertaken with a view of extending all possible assistance in the placement of returned veterans upon the land.

8. Greater speed and flexibility in the solution of all factors in the veterans' homestead problem should be facilitated through decentralization of administrative operations made possible by additional legislative authority and funds.

9. Many of the 5,000 public land laws under which administration of the public domain is carried on by the General Land Office were enacted more than a half-century ago, and many others have reached a stage of obsolescence incompatible with the requirements of efficient management of the nation's real estate assets during the years immediately ahead. A survey of the Federal land laws and a modern streamlining of their provisions should be made as a prime requisite to adequate public land administration.

10. Meantime, maximum use of the public lands and their resources can be enhanced by the enactment of a uniform Federal trespass law which would afford greater protection against the unlawful acquisition and wasteful dissipation of these national assets.

11. War legislation authorizing the disposal by the Government of sand, stone, gravel, vegetation, timber and other forest products on public lands of the United States should be embodied in permanent law, in order that these natural resources may be made available for construction purposes during the postwar period.

12. The development of Alaska through increased land settlement will require the utmost in service and safeguards for the public if economic advancement is to be attained on a permanently stabilized basis. Protection against ill-advised use of the public domain in the Territory, similar to that provided on the mainland through the requirements for classification of land tracts for the best use to which they may be put, would do much to solve this postwar problem. For this reason, the passage of legislation making such classification statutes applicable to the public land in Alaska is urgently recommended.

PLANS FOR THE FUTURE

Full benefit from the use of the public land depends, however, upon much more than mere legislative enactments, important though they may be to the proper administration of the people's quarter-billion dollar estate. It depends also upon a program of utilization based upon a carefully-planned integration of the objectives and operations of the General Land Office.

During the war years, the planning units of the Office facilitated the quick servicing of demands for land and resources required for the

prosecution of the military program. For example, more than 16 million acres of the public domain were made available as sites for camps, gunnery ranges, aviation bombing fields, tank training areas, and other combat training uses. In addition, many secret withdrawals of land were made to assist the Army and Navy in carrying on the war, and several millions of acres were placed in a state of reserve to permit the untrammelled development for war purposes of the petroleum and other mineral resources in the areas. At the same time, the activities of trained investigators and cadastral engineers and other experts in land identification, classification and management were centered almost entirely upon war-connected tasks, ranging from the examination of thousands of mining claims to the segregation of areas in Arizona, New Mexico and other States for use in experimentation and in the development of the atomic bomb.

Never before in history had the public lands under the jurisdiction of the General Land Office been called upon to provide such an abundant supply of natural resources for military purposes as in the period of World War II which drew near to a close with the end of the 1945 fiscal year.

Most of this land, like the manpower of the nation which entered the armed forces, is scheduled to return to its former "civilian" status after the need for military use has passed. The orders providing for the "enlistment" of the tracts for service in the war stipulate their eventual return to the public domain. The "discharge processing" and subsequent administration under national conservation of these lands is one of the reconversion tasks confronting the General Land Office in the immediate future.

Land Settlement Opportunities

The end of the war has centered the thoughts of many American servicemen and servicewomen upon the prospects for establishing a permanent home upon the public lands of the United States. Visualizing broad opportunities for settlement such as existed in the earlier stages of American history, thousands of members of the armed forces turned to the General Land Office during the last fiscal year for information and guidance in matters connected with the Federal homestead laws. A special leaflet, dealing in terse, question-and-answer form with the problems of homesteading on land in continental United States, was prepared for the benefit of the men and women in the military service, and distribution of other informational material dealing with the public lands both on the mainland and in Alaska was stepped up in response to popular demand.

While prepared to render all possible assistance in the solution of land settlement problems for both military personnel and civilians, attention is called by the General Land Office to the fact that, since homesteading as popularly understood first was set under way by

President Abraham Lincoln 83 years ago, good farm land upon which an agricultural living can be made as required by the homestead law is scarce on the vacant, unappropriated, and unreserved public domain in the United States.

Meanwhile, another type of use of the public lands which does not require the making of a living by agriculture, has grown during 1945 to become one of the major operational problems confronting the Office. This opportunity for land settlement by World War veterans as well as civilians is afforded under the terms of a law which authorizes the lease or sale of not to exceed 5 acres of public land for home, camp, cabin, health, convalescent, recreational, or business purposes.

Popularity of the plan is indicated by the fact that applications for leases under the law totaled more than 3,200 in 1945, as compared with only 1,600 during the preceding 6-year period. To help meet this increased demand, special land examinations had to be made, with the result that more than 30,000 acres of land, the major portion of which is located in Southern California, were recommended for classification as suitable for use under the Small Tract Act.

As the fiscal year drew to a close with prospects for a rapid return of service personnel to a civilian status, interest in the small tract land settlement program increased, areas in the vicinity of Tucson and Phoenix, Ariz., Sacramento, Calif., and Denver, Colo., being applied for, as well as tracts in Idaho, Nevada, New Mexico, and Oregon. Further expansion of the program to provide still more areas for lease and a streamlining of administrative processes to facilitate the work is an essential task confronting the General Land Office in the postwar period.

ALASKAN DEVELOPMENT

The fact that more than nine-tenths of the 375 million acres of land and water in Alaska consist of public domain remaining in Federal ownership places upon the General Land Office a large share of direct responsibility for the proper administration and development of the natural resources of the Territory. Foremost among these is the obligation to furnish authentic information concerning the various types of land-use opportunities within its borders. During 1945, this requirement was met in part by the distribution of an information bulletin on Alaska which not only has served as a standard reference publication for other Federal agencies and members of Congress, but also has provided thousands of servicemen and women with data relating to the privileges and obligations inherent in the administration of the public land laws in Alaska.

Shortly after the close of the fiscal year, Congress enacted a law making the provisions of the Small Tract Act which hitherto had been confined to continental United States, equally applicable to the public lands in Alaska. As a result, plans were immediately set

under way to gear General Land Office operations in the Territory to the requirements of the new law.

At the same time, definite steps were taken for strengthening the organization in Alaska to render effective service in meeting land settlement and other problems of resource development during the postwar period. Specifically, a new regional field office of the Branch of Field Examination was established at Anchorage to handle matters formerly routed through San Francisco, while the Alaskan Fire Control Service was vested with broader authority in the protection of public land areas from fire and in the use of timber from the public domain. In addition, special examination of some of the public lands in the Territory was made during the summer of 1945 to insure up-to-date evaluation of the areas from the standpoint of suitability for agriculture or other use in the economic development of Alaska.

Sustained Yield Conservation

Maximum benefits from the natural resources of the United States in the postwar period will require a complete cessation of the haphazard use which in former years led to denuded timbered areas, abandoned "ghost towns," and the depletion through overgrazing of the rangelands of the West and Southwest. Responsibility for the attainment of this goal on the public lands under national conservation policies rests in large measure upon the operational activities of the General Land Office.

Foremost among its obligations in this field is the establishment of sustained-yield forest-management practices on all the Federal lands under its jurisdiction, as required by Congressional mandate enacted during the 1945 fiscal year. Under this program, forestry operations on the timbered public domain eventually will be brought into a balanced ratio in which the volume of tree-cutting and of tree-growing will be regulated so as to provide a continuing supply of those natural resources on the land.

Adequate protection from fire of the 262,500,000 acres of timber, grass and brush land areas of the public domain in the United States and Alaska also is an additional administrative task assumed by the General Land Office during 1945, and plans were completed at the close of the fiscal year to preserve these resources for postwar use.

REVIEW OF THE YEAR'S WORK

The dual task of meeting the public land requirements in the Nation's war program while orienting its operations to respond to the demands for public service in the postwar period, highlighted the record of accomplishment of the General Land Office during the 1945 fiscal year. Operating through 4 branches with 12 divisions in Washington, 5 agencies in the field with 25 offices scattered throughout the

West and in Alaska, and 25 district land offices also strategically located for service in the West and in the Territory, this official real estate agent of the Federal Government closed its books for the period with a net profit both in conservation advancement and in financial gains resulting from its year's work.

RECEIPTS AND EXPENDITURES

In the aggregate, the activities of the General Land Office produce cash returns several times greater than the expenditures incident to its operations. In 1945, these cash receipts totaled \$13,381,654 and represented a ratio of \$5.66 for every \$1 of the expenditures which aggregated \$2,365,005. This was the second consecutive year in which the receipts exceeded \$13,000,000, and the fourth time that receipts of the General Land Office have exceeded \$10,000,000 since 1880.

Last year's receipts totaled \$14,355,342, and expenditures \$2,321,664.

Oregon and California Revested Lands Administration

World demands for lumber and other forest products in the post-war period were reflected in operations and plans of the Oregon and California Revested Lands Administration during the 1945 fiscal year. Established in 1938 to carry out a broad program of sustained yield forestry management on 2½ million acres of land in western Oregon, which once was encompassed in a Federal railroad grant but later revested in Government ownership, this branch of the General Land Office maintains its headquarters at Portland, Oreg.

Rated as the world's largest experimental laboratory in practical cooperative sustained yield forest management, the "O. and C." lands provide the testing ground for a world pattern of forestry economy. Under this program all elements would join in operations under which tree growing would reasonably balance tree cutting to the end that a continuing supply of raw materials will be available for the existence of industry and dependent communities. Definite plans for the further advancement of the sustained-yield program in the Pacific Northwest were made by the "O. and C." Administration during the last fiscal year.

Meantime, definite contributions to the Nation's lumber needs were made during the year from the "O. and C." lands which contain one of the finest stands of Douglas fir trees in the United States. In 1945, sales of timber from these lands exceeded 426,000,000 board feet valued at approximately \$1,518,000.

The use of aerial mapping as a means of more speedily completing an inventory of timber resources in the "O. and C." lands is expected to form a part of the work program for 1946.

Further augmenting the post-war program for betterments in the industry on the Pacific coast is the planting of seedlings on the de

cluded lands by the "O. and C." organization. Utilizing Civilian Public Service enrollees, more than 1,550,000 seedlings were planted and 350,000 trees prepared for transplanting in the field during the year.

With the end of the war, studies for broader use of the "O. and C." lands for recreational, grazing and other uses which were laid aside during the emergency, were ready to be resumed at the close of the 1945 fiscal year.

Cadastral Engineering Service

Plans for reorganization of this scientific branch of the General Land Office so as to meet the demands for accurate surveys in connection with land administration during the postwar period were brought to a completion near the close of the 1945 fiscal year. Involving the transfer of headquarters for this work from Denver to Washington, D. C., the reconversion program of the Cadastral Engineering Service contemplates the execution of a greater amount of actual survey work in the field than in previous years.

One of the major requirements in the first transfer of land from Government to private ownership, cadastral surveying consists of careful measurement of areas on the ground, the recording of such measurements by the placing of monuments or other markers, and the preparation of maps scientifically compiled from field notes made by trained engineers at the time of the on-the-ground measurements.

First undertaken 150 years ago in accordance with the ordinance of 1795, these surveys were carried on in 23 States and the Territory of Alaska in order that the identification of the assets in the people's quarter-billion-dollar real estate might be adequately protected in 1945.

Altogether a total of 9,231 miles was surveyed or resurveyed in 1945, some of the 1,287,490 acres being encompassed in areas acquired for military purposes.

With an increase in land settlement in Alaska looming large as a potential postwar development, the plans of the Cadastral Engineering Service include an expansion of survey work in that Territory.

Branch of Field Examination

The examination of land upon which is based the rejection or approval of plans for its use under the public land laws, is the major responsibility of this branch of the General Land Office. By maintaining a staff of trained technicians including mining and civil engineers, geologists, lawyers, auditors, timber cruisers, range specialists, and others experienced in land investigations, the branch handled many difficult and unusual types of cases during 1945.

For example, the reappraisal of unsold lots in a townsite in upper Miami Beach, Fla., was made by field examiners from this agency

and the subsequent auction sale brought out bidders who ran prices up to a new high in Florida beach property.

At another period of the year agents of the branch were assigned to investigate mining claims on areas set aside as military bombing ranges, while a third group made extensive investigations in the now famous Alamogordo area where the atomic bomb experimentation was carried on.

Paving the way for more efficient service to the public in the development of Alaska, a new regional office was established at Anchorage. Other regional offices maintained by the Branch of Field Examination are located in San Francisco, Calif.; Billings, Mont.; Salt Lake City, Utah; and Albuquerque, N. Mex.

Responsibilities placed upon the General Land Office by Congress in the enactment of the sustained yield forestry management act greatly increased the task of the Branch of Field Examination during the 1945 fiscal year in preventing trespass upon the public domain. Altogether, over \$70,000 was collected in payment of trespass violations of the public land laws.

Alaskan Fire Control Service

Prospects of post-war development of Alaska which will increase its burdens in the prevention and suppression of fires on more than 250,000,000 acres of public domain in the Territory, confronted the Alaskan Fire Control Service at the end of the 1945 fiscal year. The end of the war is expected to bring about an unprecedented number of tourists and settlers, the reopening of mining operations, and the construction of new airfields and roads, all of which will present new and greater fire hazards.

At the same time, increased popular interest in the Territory will bring about greater demands for the use of the timber and other natural resources of Alaska. In order that full coordination may be attained in both the protection and utilization of the timber resources, expansion of the operations of the Alaskan Fire Control Service to include management and disposal of the timber on the public lands in the Territory, was begun during the year.

Meanwhile, favorable weather conditions in 1945 resulted in the new smallest fire loss in the 6-year history of the organization. During the year, the Service took action on 57 fires with a total burned area of 2,535 acres, of which 624 acres were on private land. There were 13 fires inaccessible to the Service which burned over an estimated 110,200 acres. The number of fires for the year, therefore, totaled 70, with an aggregate loss of 112,735 acres.

Service records show that there were a larger number of fires caused by lightning in 1945 than in former years, about 37 percent of the total number of fires being started by lightning, and approximately 98 percent of the total acreage consumed being due to lightning fires.

A more extensive use of airplanes for the detection of fires and the transportation of service crews to the conflagrations is contemplated under programs formulated in the 1945 fiscal year.

PUBLIC LANDS FOR PASTURES

In the 1945 fiscal year the use of more than 12,400,000 acres of public land in the United States and Alaska for the grazing of livestock was supervised by the General Land Office as another element in its administration of the people's real estate assets. Consisting of tracts in Alaska suitable for grazing purposes and similar areas in the United States not included in established Federal grazing districts, a total of 12,479,270 acres were made subject to use under 10,593 leases involving annual rental of \$229,523.

In order that maximum production of meat and other livestock products might be provided from the public lands during the reconversion period, plans were being formulated at the close of the 1945 fiscal year to increase the stocking capacity of the range lands. It is estimated that with proper range facilities and improved range practices the capacity of the leased area could be increased 50 percent and an additional 10,000,000 acres leased if the improvement and rehabilitation program is carried forward to completion. Meanwhile, operations of the Range Development Service of the General Land Office, previously halted by war conditions, were scheduled for resumption as the close of the fiscal year brought an approaching end to the war.

Under the supervision of this Service improvements on the range such as the development of springs and wells, the construction of fences, the reseeding of areas denuded of vegetation, and the control of rodents and other predatory animals is undertaken in cooperation with the stockmen.

THE PUBLIC LANDS

AREA OF THE PUBLIC LANDS

The area of public lands remaining in Federal ownership, including Indian trust and tribal lands, as of June 30, 1945, amounted to about 413 million acres in the public land States and about 365 million acres in Alaska. Approximately 400 million acres of these public lands were vacant, unappropriated, and unreserved as follows: 37 million acres in the States outside of Federal grazing districts; 133 million acres within such districts; and 230 million acres in Alaska. During the year 692,000 acres were withdrawn for various public purposes while withdrawals reserving 9,497,000 acres were revoked.

Of the approximately 778 million acres remaining in Federal ownership in the States and Alaska, 118 million acres in the States and 363 million acres in Alaska were still unsurveyed as of June 30, 1945.

The total acreage patented with minerals reserved to the United States was increased during the year to 48,766,625 acres as shown on the following table:

Acreage of lands patented with minerals reserved to the United States, as of June 30, 1945

Type of mineral reservation	Patented during fiscal year 1945	Total patented through June 1945
Reservation of all minerals:		
Under Stock Raising Act.....	15, 094	33, 556, 052
Under other acts.....	50, 684	2, 376, 256
Total.....	65, 778	35, 962, 308
Reservation of specific minerals:		
Coal.....	5, 084	10, 875, 615
Others ¹	7, 342	1, 928, 702
Total.....	12, 426	12, 804, 317
Grand total.....	78, 204	48, 766, 625

¹ Includes coal reserved in combination with other minerals.

Leases and Permits

During the year an additional area of 1,793,513 acres was brought under lease, including mineral permits and licenses, making a total of 17,707,440 acres under lease at the end of the year. The types of leases in force June 30, 1945, are shown by the following tables.

Mineral leases, permits, and licenses outstanding,¹ as of June 30, 1945

Mineral	Leases		Permits		Licenses		Total	
	Number	Acres	Number	Acres	Number	Acres	Number	Acres
Oil and gas.....	² 6, 969	4, 521, 486	-----	-----	-----	-----	6, 969	4, 521, 486
Coal.....	331	76, 190	79	66, 635	88	3, 385	498	146, 210

Grazing (Oregon and California).....	212	263, 044. 01	8, 368. 08
Grazing (Taylor Act, sec. 15).....	10, 584	11, 310, 316. 49	228, 254. 44
Recreational.....	17	20, 003. 78	1 610. 70
Small sites (5-acre tracts).....	626	3, 091. 32	¹ 3, 080. 00
Water well.....	15	600. 00	585. 50
Others.....	3	153. 01	10. 00
Total.....	11, 528	12, 928, 748. 81	243, 478. 07

¹ Does not include rental of 1 lease, the rental of which is based on receipts.

² Does not include rental of 10 business site leases, the rentals of which are based on receipts.

In addition, 393,000 acres were being used at the end of the year by Federal and local agencies, private individuals, and corporations under permit from the Commissioner of the General Land Office. War agencies held Departmental permits for the use of almost 24,000,000 acres of public lands.

Homesteads, Sales, and Other Entries

Although the total number of entries on the public lands declined again during the year, the number of new homesteads and public auction sales increased over last year. The number of new homesteads in Alaska totaled 117, compared to 94 in the fiscal year of 1944 and 79 during 1943.

The following table shows the new entries and selections allowed, the entries finally approved and the patents and certifications issued during the year. At the end of the year, 4,156 entries embracing 626,000 acres were pending awaiting further compliance with the public land laws by entrymen or final action by the General Land Office.

Entries and selections, fiscal year 1945

Type of entry or selection	Original entries and selections ¹		Final entries ¹		Patents and certifications ¹	
	Number	Acres	Number	Acres	Number	Acres
Homestead entries:						
Stock raising.....			26	12,711.18	32	15,094.37

¹ An original entry or selection is one made in pursuance of an act of the Congress which prescribes the terms and conditions under which patent may be issued or other evidence of title granted. An original entry becomes a final entry upon compliance by the entryman with further requirements of the law, such as residence or additional payment, and upon the issuance of a final certificate. A final certificate shows that, in the absence of irregularity, the entryman is entitled to a patent and passes equitable title to the land to the entryman. Where upon final examination it is found that an entry or selection is in proper form and that the law has been complied with, a patent conveying legal title to the claimant is issued. In the case of certain State selections, the legal title is conveyed upon approval thereof by the Secretary of the Interior and upon certification by the Commissioner of the General Land Office.

² Includes 3 homesteads on ceded Indian lands (433.60 acres).

³ One selection was amended.

⁴ Town lots upon which only part payment was made; area not tabulated.

⁵ Includes 4 homesteads on ceded Indian lands (400.00 acres).

⁶ Includes 9 homesteads on ceded Indian lands (759.94 acres).

⁷ Includes 14 homesteads on ceded Indian lands (1,240.90 acres).

⁸ Includes 1 homestead on ceded Indian lands (80.00 acres).

⁹ Includes 3 homesteads on ceded Indian lands (280.75 acres).

¹⁰ Includes certifications, 47,963.15 acres.

¹¹ Acreage previously reported.

Land Grants

Title to 73,765 acres was conveyed during the year in satisfaction of grants of public lands made by the Congress to States and railroads for public purposes. Grants to States included 43,237 acres of indemnity school land selections, 14,983 acres of park selections, 9,280 acres of swamp land, and 4,726 acres selected for miners' hospitals. A total of 1,539 acres was patented to railroad companies pursuant to the Transportation Act of 1940. In addition, 16 patents were issued to States to give them additional evidence of title to 407,833 acres of previously granted school lands.

A total of 218 applications for rights-of-way were approved during the year under laws which provide for the granting of rights-of-way over the public lands for telephone and telegraph lines, public roads, pipelines, and other purposes. Of the applications approved, 104 were permits or easements with an annual rental of \$1,730 and 32 were temporary rights-of-way over "O. and C." lands with an annual rental of \$160.

Land Exchanges

Exchanges of land with private owners and local governments resulted in the addition of 56,087 acres to grazing districts in exchange for 51,954 acres of Federal land; 9,037 acres to Indian reservations in exchange for 9,079 acres; 480 acres to the "O. and C." lands in exchange for an equal acreage; and 197,395 acres to national forests in exchange for 10,877 acres of land and sufficient timber to equalize the values involved.

RECEIPTS AND EXPENDITURES

Receipts from all sources during the year totaled \$13,381,653. Mineral rentals, royalties, and bonuses accounted for 82 percent of the total receipts and sales of timber from the Oregon and California and Coos Bay lands for an additional 13 percent. The remaining 5 percent were realized from sales of public and ceded Indian lands, rentals, fines and penalties, copying fees, and from miscellaneous sources.

Of the total receipts, 38 percent will be distributed among various State and county governments and 44 percent will be covered into the reclamation fund. The remainder, except for \$10,384.58 which will be credited to Indian trust funds and \$57,734.66 which will be credited to the range improvement fund, will be covered into the general fund of the Treasury.

Expenditures from appropriations amounted to \$2,365,005 distributed as follows: general administration, \$867,783; surveys, \$517,297; field examination, \$343,482; administration of the revested and reconveyed grant lands, \$290,956; district land offices, \$267,925; range improvements, \$44,275; and fire control in Alaska, \$33,287. Ex-

penditures, aggregating \$319,191, were made from funds transferred to the General Land Office for the emergency protection of public lands and for soil and moisture conservation operations.

The following table shows the receipts earned during the year, by sources and Treasury accounts.

Disposition of receipts of the General Land Office:¹ fiscal year 1945

Source of receipts	Covered in the Treasury earmarked for—				
	General fund	Reclamation fund	States and counties	Indian trust funds	Total
Sales of public lands.....	\$79,582.17	\$100,000.00	\$3,800.00		\$183,382.17
Fees and commissions.....	17,359.71	\$61,000.00			78,359.71
Mineral leases and permits:

¹ Before final settlement of all accounts by the General Accounting Office.

² Estimated.

³ Includes \$52,577.64 collected in California under act of Oct. 2, 1917 (40 Stat. 297).

⁴ Includes \$23,767.94 collected in Wyoming under act of June 26, 1926 (44 Stat. 1621), \$176,868.94 collected in California under Executive Order 9087 dated Mar. 5, 1942, and \$15,967.22 collected in Alaska.

⁵ Range improvement fund.

⁶ Includes \$112.50 from sale of reserved reclamation lands.

Office of Land Utilization

LEE MUCK, *Assistant to the Secretary*

RECONVERSION in a broad sense means the return of the Nation as expeditiously as possible to the pursuits of peace. For the Department of the Interior it points to the need of an inventory of those national assets for the management of which we are directly responsible; a determination as to the extent of the depletion of these assets which may have occurred as a result of the war; and the preparation of plans which will insure a maximum restoration of the impaired values and the development of a sustained national economy. The basic wealth of the Nation, represented in large measure by its soils and waters, forests, and pasture lands, has been drawn upon as never before to provide the essentials of war that brought victory to the United States and its allies after five destructive years. Reconversion to a sound peacetime economy following the war and its attendant heavy drain upon the natural resources of the Nation therefore presents a problem and a challenge to the Department in the field of land and resource management.

The problem and the challenge involved in reconversion place a responsibility upon the land and resource management agencies of the Department to provide a more fully coordinated and integrated management program by virtue of which the lands and resources under their respective jurisdictions will be so administered as to insure the greatest possible returns to society in the years ahead.

The value of cooperation and of coordinated and integrated action to secure desired results was most clearly demonstrated during the war. The principles involved were not new but the successful application thereof under so many and such varied conditions constituted a complete demonstration of the importance of unified action in the conducting of operations. If the same cooperative approach is applied to the solution of the problems of peace, the future of the Nation is assured, regardless of the serious drain on its natural resources.

The land and resource management problem facing the bureaus and agencies of the Department of the Interior in reality is not one problem but many problems, all closely related and having a distinct

bearing on the successful establishment of peacetime economy. The complexity and interrelation of land and resource management problems which exists has been recognized in the Department for many years and finally brought about the establishment of the Office of Land Utilization in the year 1941 with a view to evolving a unified conservation program. In the interim much has been accomplished, but much more remains to be done to coordinate and integrate fully and effectively the operations of the respective bureaus and agencies of the Department and to secure effective cooperation with other governmental agencies operating in similar land-use fields.

While major attention during the past 4 years has been directed to winning the war, nevertheless the long-time problems of peace have not been neglected, and marked accomplishments have been made in several important lines of cooperative endeavor, namely:

1. The development of a Nation-wide soil and moisture conservation program on lands under the jurisdiction of the Department of the Interior.
2. The coordination of the forestry activities and the development of a more effective forest and range protection program.
3. The clarification and reorientation of the land-use policies of the Department and the establishment of sound land-classification procedures.
4. The organization of the Water Resources Committee which is charged with the responsibility of acting for the Department and its agencies on problems affecting the water resources of the Nation.
5. The rendering of advisory service looking to the solution of numerous day-to-day management problems that constantly arise in a Department with highly diversified activities.

The encouraging results accomplished were made possible through the application of a high level of functional coordination and the integrating and reconciling of divergent views, experiences, and judgments in the field of land administration. The objectives sought were attained through cooperative efforts and the dissemination of information with respect to operating programs and practices and through the rendering of technical service on management problems. The practical application of these administrative principles and the degree of success achieved in the several fields in which they were applied are hereafter set forth.

SOIL AND MOISTURE CONSERVATION OPERATIONS

The Soil and Moisture Conservation program of the Department of the Interior is an integrated and coordinated program conducted through the land-management agencies of the Department on the Federal lands under their respective jurisdictions. It is a segment of

the national soil conservation program, the other parts of which are conducted by agencies in the Department of Agriculture. It has for its purpose the correction of soil erosion and water losses occurring on approximately 60 million acres of land widely distributed through the various States in which there are public lands. The principal areas on which soil and moisture conservation operations are being performed comprise portions of the various river basins lying west of the Mississippi River and largely west of the Rocky Mountains.

Within each of these river basins there are land areas administered by some one or more of the land-management bureaus of the Department. For example, in the Snake River Basin—a tributary of the Columbia—there are national parks and monuments, fish and wildlife refuges, Indian lands, reclamation projects, grazing districts, and unappropriated and unreserved public domain areas. An orderly, integrated plan of soil and moisture conservation on Federal lands under the jurisdiction of the Department of the Interior in the Snake River drainage basin requires that the Department exercise supervisory authority over conservation operations in the whole area in order to insure that the various land-management agencies perform soil and moisture conservation operations within the basin that are essential to the correction of the situation as a whole. These operations are further coordinated with the management responsibilities of the agencies concerned in order that full value may be obtained from the restoration and management work performed. Furthermore, since there are intermingled lands in private ownership within the basin, and also lands under the administration of other Federal and State agencies, it is necessary that the Department of the Interior conservation program be coordinated with the programs of these other agencies. Specific reference in this connection is made to the State soil conservation districts operating under State law with the advice and aid of the Soil Conservation Service, Department of Agriculture, and the general program of the Forest Service, also in the Department of Agriculture.

The problem is a complex one from any angle. The task of restoration under the best of circumstances is difficult. The complex land ownership pattern and the conflict of interests and uses tends further to complicate the situation.

The Office of Land Utilization determines the over-all program in the areas where operations are to be conducted, harmonizes and compromises any differences that may develop, and provides for a maximum amount of assistance necessary to secure correction of erosion and water losses. To this end, advice and assistance are given to the agencies concerned regarding the conditions and circumstances under which projects may be established, the type and character of work to be performed, and approval of the expenditures to be incurred. Under this program attention can be, and is, directed to-

ward the correction of conditions on the more critically eroded areas of Federal lands and the operations performed are those of proved value as demonstrated heretofore under like soil and other conditions.

Wherever possible the securing of a maximum amount of cooperation from the users of the lands is urged, for, while the lands are exclusively or primarily in Federal ownership, the users who are dependent thereon for a livelihood have a definite interest in their reconstruction and improvement. This cooperative feature constitutes a further coordination of the soil and moisture conservation program which facilitates and hastens the corrective procedures while providing more definite assurance against recurrence of the destructive processes that have heretofore occurred. The constant pressure by the Department in this matter of cooperation has resulted in a year-to-year increase in the amount of such cooperation, until at the present time the amount contributed is almost equal in value to the appropriations authorized by Congress for soil and moisture conservation operations on the Federal lands.

The soil and moisture conservation program of the Department comprises operations on 500 project areas scattered through 30 States, embracing a total area of approximately 60 million acres. It has been determined that of this total between 10 and 12 million acres can be classed as being in a serious or critically eroded condition. Approximately 20 million acres in addition should receive some attention from a soil and moisture conservation standpoint, with the remaining 30 million acres largely in the twilight zone where material benefits from a conservation standpoint can be obtained without too large expenditures, provided the lands and resources are properly managed.

FOREST CONSERVATION

In the field of forest conservation the program of the Office of Land Utilization has been mainly directed toward the accomplishment of three specific objectives:

1. The securing of adequate protection for the forest and range resources administered by the Department.
2. The development of the sustained-yield principle in the management of the forest resources under the jurisdiction of the Department.
3. The formulation of a sound plan of management for the forests of the interior of Alaska.

In the field of protection the Office of Land Utilization rendered advisory service to the agencies concerned in more fully and adequately presenting to the Congress the whole forest protection problem on the 400 million acres of forest, brush, and grass lands under management in the continental United States and Alaska. Appropriations made available during the past 4 years have more than doubled and, while not yet sufficient to provide adequate protection

for all of the lands in need thereof, the several agencies concerned are better organized and better prepared than ever before to protect the public lands from the ravages of fire, insects, and disease. As concrete evidence of progress in this direction, it should be noted that the area burned over in the continental United States has been reduced from 1,879,613 acres in the calendar year 1942 to 552,235 acres in the calendar year 1944; and in Alaska, from 4,500,000 acres in 1940 to 110,603 acres in 1944.

Cooperative work carried on with the Bureau of Entomology and Plant Quarantine, Department of Agriculture, in which the Office of Land Utilization acts in a supervisory capacity, has brought about the coordination of white pine blister rust control operations designed to protect the valuable five-needle pines from the white-pine blister rust. Control work has been definitely advanced on the national parks, Indian reservations, and the Oregon and California revested grant lands. At the close of operations last December, a total of 163,000 acres out of the 728,000 acres of white pine lands under the jurisdiction of the Department had been covered by the preliminary eradication of the species of brush responsible for the spread of the disease. Plans are in preparation involving expanded and more intensive operations looking to the control of infections that are a constant menace over large areas of land, portions of which are under the jurisdiction of the Department.

Sustained yield of forest resources contemplates improvement in conditions of growth, management of the timber stand, and utilization of the timber crop in ways that will permit and sustain the entire economy built around the lumber industry. The Office of Land Utilization participated during the preceding year in the preparation and presentation to the Congress of information relating to the values inherent in the sustained-yield principle. The representations made in this connection by Federal, State, and private agencies resulted in the enactment of the cooperative sustained-yield forest management act of 1944, authorizing the Secretary of the Interior and the Secretary of Agriculture to establish sustained-yield units either directly or in cooperation with other forest land owners. A general statement of policy with respect to the administration of this law was formulated by the Department for the guidance of the agencies concerned. Marked progress was also made in the application of the sustained-yield principle under the O. & C. Act of 1937, and a form of cooperative agreement was worked out by the General Land Office and the Office of Land Utilization.

The major forward step taken by the Department in the field of forest conservation during the year 1944 was the securing of a regular appropriation of \$147,460 "For the administration and management of forest resources, including the prevention and suppression of fires

on the public domain in Alaska, * * *." This appropriation will make possible the setting up of administrative machinery, under the direction of the General Land Office, which will insure the protection and management of these vast resources of the interior of Alaska for the first time since the Territory was acquired from Russia. It means for Alaska, and for the Nation, the protection of these forests from fire and the establishment of sound forestry practices in connection with the development thereof.

The timber sale operations conducted on the lands under the jurisdiction of the Department normally constitute a business amounting to more than 3 million dollars in value and reflect a timber cut of over a billion feet a year. War demands continued at a high level during 1944 and, as a result, a large number of timber contracts were considered and approved by the Department.

LAND CLASSIFICATION AND LAND POLICY

During the year 1944 a study was conducted of the land-classification activities of the General Land Office and the Grazing Service, and recommendations were made for coordination and expedition with respect to these activities. A draft statement for the Departmental Land Policy Committee on the land-management policies of the Department was completed and submitted to the Department for final consideration. Land-administering agencies of the Department were kept informed concerning surplus real property in which such agencies might have an interest, and a survey was initiated looking to the compilation of a list of surplus areas suited for addition to existing administrative units. About 1,500 applications involving the disposal, lease, or permitted use of public lands were reviewed. Many of these cases were on appeal or otherwise involved controversial issues and required most careful consideration before recommending action. The General Land Office was assisted in preparing a statement of conservation policy with respect to the sale of isolated tracts of the public domain, and the statement was issued as Departmental Order No. 1973, under date of August 4, 1944.

CIVILIAN PUBLIC SERVICE CAMPS

The Office of Land Utilization continued to act in a liaison capacity between the Selective Service System and the bureaus of the Department of the Interior in the operation of the civilian public service camps during the year 1944. These camps, which provided work of national importance in the protection and conservation of natural resources—including fire, insect, and disease control and water conservation projects—were under civilian direction and were manned by persons who, by reason of religious training or belief, conscientiously opposed participation in the war.

At the close of the year, 10 civilian public service camps were operating on Department of the Interior lands: 5 on the national parks, 3 on reclamation projects, 1 on the O. & C. lands of the General Land Office, and 1 on a national wildlife refuge. The Seney National Wildlife Refuge camp, located in the State of Michigan, was abandoned on June 1, 1945.

WATER RESOURCES COMMITTEE

The staff work of the Water Resources Committee, established by departmental order dated May 2, 1944, was conducted by the chairman and the executive officer during the fiscal year just passed. The objective sought by the Committee is to insure the coordination of water-development programs within the Department in order that full recognition may be given to the over-all benefits to the Nation.

In carrying out its stated functions, namely, the assembly and dissemination of essential information concerning water-development programs, the following work was accomplished by the Committee:

1. Sixteen formal meetings were held; and the executive officer represented the Committee at 12 meetings of the Federal Interagency River Basin Committee.

2. Recommendations designed to promote cooperation and coordination at the field level were submitted to, and received the approval of, the Secretary.

3. Consideration was given to a number of project and basin reports of agencies within the Department and the War Department, and definite recommendations were made thereon.

4. Detailed information concerning water projects, laws, policies, and related features was assembled and made available to the interested agencies of the Department.

5. Operating procedures looking to the coordination of the water-development and water-conservation programs of the Department were established.

The progress made in the coordination of the water-development programs of the Department of the Interior has been encouraging, and the procedures laid down by the Congress in the Flood Control Act of 1944 and the Rivers and Harbors Act of 1945 have greatly strengthened the cooperation between the Federal agencies and the States. However, much remains to be accomplished before the degree of coordination essential to sound management in this complicated field can be fully attained.

PRINCIPLES OF COORDINATION

Experience in the Department of the Interior during the past several years has clearly demonstrated the value of effective coordination and close cooperation in the field of land and resource management. It

seems obvious also that the coordination of conservation activities of a Department organized on a bureau basis can be secured by devices less drastic than complete centralization and that a common plan of action which cuts across structural lines in the pursuit of an over-all interest is possible of attainment without seriously disrupting well-established bureau organizations.

The Office of Land Utilization, since its creation in 1941, has proceeded on the theory that the application of the fundamental principles of coordination and cooperation can be effected without overlapping or duplication and without interfering with the administrative authorities of the bureaus operating in the various functional fields. It has earnestly sought to promote a unification of action directed towards a common goal through cooperative efforts, the dissemination of information, and the rendering of efficient advisory service. The methods pursued have proved to be reasonably successful and have operated definitely in the public interest. It seems clear that the time has arrived when these principles of administrative management should be extended to all agencies operating in the conservation field, for the effective use and development of the basic wealth of the Nation—its soils and waters, its forests and pasture lands—will not be at its best until all interests involved have fully coordinated their responsibilities and activities.

Grazing Service

C. L. FORSLING, *Director*

UNDER the administration of the Federal range, as provided by the Taylor Grazing Act, the surface resources of the grazing districts on most of these public lands were in as good condition at the close of the fiscal year as they were at the beginning of the war, or better. At the same time they made their contribution in meeting the Nation's needs for war. This is in sharp contrast to the First World War when increased numbers of livestock, on the then unregulated, open public range, which, under the circumstances, did not contribute materially to food supplies during the war, resulted in overstocking that added to the already serious degree of depletion of the forage and soil resources.

The aim of the administration of the grazing districts is twofold; namely, the protection, improvement, and proper utilization of the natural resources on these lands and the stabilization of the livestock industry dependent upon them. These public lands, together with the non-Federal lands associated with them, continued during the past year to contribute to the Nation's needs of food and fiber, without material injury to their permanent productive capacity. While the Federal range on the whole is still far below its potential production capacity, due to past overuse and fire, extensive areas actually improved in condition as the result of weather conditions above the average, coupled with regulated use.

Nearly 40 percent of the range land in the 11 Western States is situated within grazing districts. Somewhat more than half of this is Federal land; the remainder is in private, State, and county ownership. Associated, both physically and economically, these grazing lands and the intermingled crop lands are the foundation of numerous livestock producing enterprises. Although range land makes large contributions by providing grazing for livestock and big game, its problems are closely related to those of other resources among which are water, wood, crop lands, and recreational use.

Settlement of public land under the homestead pattern of earlier years was reached and over-run during the aftermath of the First World War. New frontiers now lie chiefly in managing the remnant

of the former vast public domain so that it may be put to its highest use and fitted into the over-all land-use economy of each locality. The benefits to be derived are shared by the range users, local communities, and the public.

The war has also emphasized the importance of the Federal range in the training of air and ground troops, the testing of machines, precision instruments, and explosives, and in perfecting techniques of modern warfare. A total of approximately 14,500,000 acres was so utilized. Through cooperation with the War and Navy Departments it was possible for certain of the affected lands to be grazed at the proper time without interference with their use for military purposes. In other instances it was necessary to exclude livestock. One withdrawal in New Mexico, for example, involved the removal from grazing district land of 8,421 cattle, 618 horses, 12,432 sheep, and 10,861 goats belonging to 47 permittees. In still other instances, through special arrangement with the military services, it was possible to provide alternate grazing during the war period for nearly 500,000 sheep and 16,000 cattle on areas set aside for war purposes in several States.

First among the resources and values of the Federal range are the plant cover and the soil. Their protection and improvement are basic to all other uses and values and particularly to the sustained yield of forage for grazing animals. Of equal, if not of greater importance, is the relation of these lands to water supply for irrigation and other purposes. Numerous individual ranches and farms, as well as communities, obtain their water supplies directly from these lands. In addition the Federal range and associated lands contribute more or less run-off to streams which are the source of supply to distant towns, cities, and irrigated fields. Water is so important in the West that it is imperative that watershed lands be maintained in a condition to yield the maximum quantity and quality of water. Silt-laden reservoirs and clogged streams or irrigation canals are a direct concern to irrigation, industry, and commerce, as well as to the farmer at the far end of the ditch. Maintaining adequate plant cover conditions is the key to adequate watershed protection.

Thousands of families obtain fuel, fence posts, farm timbers, and rough lumber from the 23 million acres of woodland and forest on the Federal range. No detailed survey has ever been made of the forest and woodland growth. Assuming, however, that the areas classified as woodland and forest contain an average of 10 cords of wood to the acre, there are 230 million cords of wood in grazing districts. In addition to the foregoing there are special use values, such as rights-of-way, home and business sites, recreation, and sites for commercial photography.

No adequate survey has ever been made to determine the value in terms of dollars and cents of the surface resources of the public land in grazing districts. Any attempt to do so at this time, therefore, must be based upon many assumptions. It may be assumed, for example, that 144 million acres of grazing land have an average value of \$1.25 an acre for soil and forage. The estimated 230 million cords of wood are considered to have a value of 50 cents a cord.

Many factors enter into the problem of attaching a tangible cash value to these lands for watershed purposes. What is the value of a watershed, for example, to a community which derives its domestic water supply from it? What protection values may be assigned to a given area for the control of floods, the prevention of the deposition of silt in streams and reservoirs, or the abatement of dust storms? Certain areas rank high in these respects and at the other extreme, certain other areas have practically no watershed value. Hence, the dollar value of watersheds, ranging from \$12 or \$15 an acre or more in some localities to nothing in others, may be arbitrarily set at \$1 an acre for the 144 million acres of Federal range.

It would be difficult to estimate the value of the public lands for training and testing grounds and the parts these lands played in winning the war. Had the Federal Government been obliged to purchase the 14½ million acres of public lands used for war purposes, a considerable item would have been added to the cost of the war. The availability of these lands for war purposes and for special uses as home sites, commercial photography purposes, rights-of-way, and stock driveways, for which the Federal Government derives revenue, is arbitrarily placed at \$52,000,000.

In addition to the foregoing, range improvements placed on the Federal range at public expense during the past 10 years, consisting of 17 major types, are estimated to have a residual value of \$10,000,000.

On the basis that has been outlined, the capital value of the 144 million acres in the custody of the Grazing Service may be tabulated as follows:

Soil and forage at \$1.25 an acre.....	\$179, 000, 000
Watershed at \$1 an acre.....	144, 000, 000
Woodland and forest, chiefly woodland, at 50 cents a cord.....	115, 000, 000
Range improvements.....	10, 000, 000
Special uses.....	52, 000, 000
Total.....	500, 000, 000

In undertaking to rehabilitate the range and stabilize its use, the Grazing Service generally has had the active support and cooperation of the users themselves, including the district advisory boards. A much greater interest and concern in the condition of the range on the part of the stockmen is noticeable as compared to a decade and a

half ago. The Grazing Service is hopeful that the willing cooperation of the range users, who, after all, are most vitally concerned in maintaining and improving forage production on the range, will bring about, within practical time limits, the further adjustments that may be needed wherever necessary to stop further range deterioration and to turn the trend in favor of range rehabilitation.

In addition to rehabilitation, extensive further development of the range is needed to facilitate range administration, promote its full economic utilization, make possible better handling of livestock, and improve the quantity and quality of the resources. Needed projects include water developments, fencing, construction of roads, trails, and telephone lines, rodent control, the installation of improvements for fire control, soil and moisture conserving structures and improvements of the forage cover by both natural and artificial reseeding.

The forage cover, and hence the grazing capacity, can be improved within justifiable economic limits on literally millions of acres of the Federal range by mechanical treatment and reseeding. The presence of thrifty sagebrush, for example, which occurs on millions of acres of land, is indicative that soil and moisture conditions are ample for the production of a good forage cover. Over extensive areas the sagebrush has thickened to an extent that the better forage plants have been greatly reduced or almost entirely eliminated. By the judicious use of controlled burning or breaking down the sagebrush with heavy equipment, the land can be freed of sagebrush in a manner to permit the growth of grasses and other forage plants. Where the remaining native forage plants are insufficient to revegetate the land naturally, reseeding will be necessary. A vast opportunity lies ahead in this line of endeavor in the grazing districts. The same is true also for extensive areas of nonsagebrush land needing rehabilitation.

The Grazing Service has presented estimates for a postwar conservation program for use especially in the event that an emergency employment program should become necessary. Employment under this program, in addition to the unskilled labor, would include engineers, draftsmen, range technicians, carpenters, drillers, truck drivers, tractor operators, dragline operators, and many other types of skilled labor.

Since the areas where the work is proposed are remote from centers of population and the projects variable in size and character, it would seem feasible to operate from work camps to be distributed over the territory. This will likewise be attractive to local citizens who seek employment within reasonable proximity of their homes. The plan contemplates construction of 150 portable camps with facilities to accommodate 100 men at each camp.

The backlog of work in sight is estimated to require 67,000 man-years or full employment of 20,000 men for 3¼ years at a total cost of \$191,422,500. Of this total, the amount of \$50,714,500, about 26

percent, is estimated on the basis of actual needs of the range, to be in the interest of the livestock industry, and predicated on increased forage production values which would compensate for the carrying costs of the investment. The balance is considered to be a responsibility of the Federal Government to rehabilitate, preserve, and protect the capital values inherent in the land and its resources in the public interest.

RANGE ADMINISTRATION

Forage conditions during the year were, on the whole, better than average during the previous year but extreme drought persisted in localized areas causing some losses. The grazing load in terms of permitted animal units declined 1 percent while the numbers of permitted livestock decreased 6 percent from 10,694,305 to 10,019,178 head. There were 725,464 fewer sheep, but 86,174 more cattle during 1945 than in 1944. For the first time in grazing district history the number of permitted cattle exceeded 2,000,000 head.1

Ranch sales involving grazing preferences on the Federal range and transfers of privileges under the Federal Range Code reached a new high during the year. Livestock generally were in good condition and with the current high prices and consumer demand the users were encouraged to cut down their numbers, especially cattle, as a means of providing for the dry years which, according to experience, inevitably lie ahead. Losses of forage caused by trespassing stock and range fires are still excessive. This situation cannot be corrected fully until adequate manpower on the ground is available to patrol and supervise the area.

The grazing district advisory boards are an important part of the Grazing Service organization. Their cooperation in lending advice on range problems, improvement, wildlife protection, and economic conditions within the industry aided materially in the administration of grazing districts during the eleventh year of their participation in the program.

Recheck of grazing capacities and proper seasons of use and the reexamination of many dependent properties are recurrent jobs. The ultimate goal of properly stocked ranges subdivided into units or allotments, to be utilized under term permits by all who are entitled to share in the use of the range has not been wholly achieved.

Only two-thirds of the authorized users are operating on a term-permit basis although most of the licensees and permittees can now plan their year-to-year range operations with reasonable assurance, subject, of course, to the variable weather conditions and other unforeseen factors, including needed adjustments which will be necessary in some cases upon completion of range surveys and base property inventory.

GRAZING FEES

In regard to the fees to be charged, section 3 of the act provides: "That the Secretary of the Interior is hereby authorized to issue or cause to be issued permits to graze livestock on such grazing districts * * * upon the payment annually of reasonable fees in each case to be fixed or determined from time to time." Grazing fees of 5 cents for cattle and horses per month and 1 cent for sheep and goats were established in 1936 when the livestock industry was beginning to recover from drought and depression and when grazing districts were new. During the year consideration was given to increasing the grazing fees pending the completion of a comprehensive range appraisal. This matter was first broached to the National Advisory Board Council in November 1944. Since then and up until September 10, 1945, further study and 10 hearings on the matter have been conducted by the Senate Committee on Public Lands and Surveys, in Washington, D. C., and 8 of the Western States. Recommendations on the fees by the Director are being delayed until the facts presented at the hearings and obtained through various studies have been fully analyzed.

LICENSES AND PERMITS

Due to transfers, liquidation, and suspension of emergency licenses there was a reduction of licenses and permits issued during the year from a total of 22,562 in 1944 to 21,650 in 1945, a difference of 912. Livestock use the range under licenses and permits at various periods during the year. The statistical detail is shown by regions in table I at the end of the chapter.

Big game numbers in grazing districts represented by 11 major species totaled 583,432 head. A proper distribution of game animals over the range generally has not been achieved and, as a consequence, many "sore spots" exist where game is concentrated to the detriment of both game and forage.

Approximately 20,000 excess horses were removed from the range during the year. Action under the Secretary's orders of March 16, 1943, and January 29, 1944, resulted in the removal of about 100,000 surplus horses from grazing districts and adjacent lands during the past 3 years. Steps are needed to encourage purchase and shipment of excess horses by appropriate agencies for food and farm purposes in devastated countries.

RANGE SURVEYS

Extensive range surveys were accomplished on 2,065,964 acres in four regions. On 1,051,661 acres previously surveyed the grazing capacities were checked in preparation of range management plans. In connection with the allocation of range privileges in one district,

1,819,697 acres were surveyed on a reconnaissance basis. Approximately one-third of the above acreage is within approved soil and moisture conservation projects. Property examinations were made in 1,839 cases during the year. An estimated job load of 17,959 such cases exists in 60 grazing districts of which 13,673 have been examined to date, only one-third of which are completed to required standard. The appropriate decision as to the relative claims of about 5,000 bona fide applicants for range privileges is still tentative and unsettled. This program should be augmented in order to achieve the conservation objectives of grazing districts.

HEARINGS AND APPEALS

During the fiscal year 1945, 100 appeals from decisions of the local administrative officers were filed, 86 of all pending appeals being disposed of by cooperative actions between the appellants and district rangers or through formal hearings and decisions of examiners. Ten examiners' decisions were appealed to the Secretary.

LAND PLANNING AND UTILIZATION

Fundamental in the conservation program is a policy which will fit the complexities of land ownership within grazing districts into manageable units whereby the land can be properly administered and the greatest benefits will accrue to both public and private lands. This is accomplished mainly through exchange of lands, exchange of use, cooperative agreements with States, counties, and individuals, and by leasing lands within the boundaries of grazing districts under the Pierce Act.

Land planning in grazing districts to improve the pattern of ownership was undertaken and considerable progress has been made during recent years. Detailed plans involving a long-time program of exchange, blocking and negotiation were submitted for review. One of the most effective means of coordinated land administration in areas of mixed ownership is through cooperative agreements with the individuals, groups, or agencies affected. A number of such agreements were inaugurated during the year and many that were entered into during previous years were continued.

COOPERATION WITH MILITARY SERVICES

At the end of the fiscal year 14,403,302 acres of public land in grazing districts were involved in military withdrawals and use permits representing a reduction of 25,617 acres from the amount used for such purposes during the previous year. Major military uses of public lands include testing ranges for bombing, aerial gunnery, machine-gun practice, and areas for airfields, airports, landing fields,

tank corps maneuver grounds, proving grounds, storage dumps, and depot centers. Also lands were provided the War and Navy Departments, the Defense Plant Corporation, the Civil Aeronautics Administration, and the Federal Housing Authority for rights-of-way, telephone lines, water-pipe lines, landing strips, and airfields.

Other activities in connection with the war program included the consideration of applications for timber, involving millions of board feet, in grazing districts under the act of June 5, 1942 (Pub. Law 586, 77th Cong.). Assistance was given to military services in the appraisal of nonpublic lands listed for lease, purchase, and condemnation.

STATUS OF GRAZING DISTRICTS

Grazing districts total 60 in number, there having been no change during the year. However, modification orders, withdrawals, and revocations involving public lands mainly for reclamation and military purposes caused many internal changes in grazing districts, resulting in the addition of about 5,000,000 acres of all categories of land to the total area administered during the previous year. The statistical detail of grazing district acreage is shown on table II at the end of the chapter.

LAND CLASSIFICATION

At the beginning of fiscal year 1945, 283 individual land cases were pending within grazing districts under sections 6, 7, 8, and 14 of the Taylor Grazing Act; the 5-acre-tract law of 1938; and other public-land laws. A total of 783 new cases were received, 671 were disposed of, and 395 were pending at the close of the year.

PIERCE ACT LEASES

Favorable economic conditions of recent years have created an active demand for non-Federal grazing lands as well as for crop lands within the boundaries of grazing districts. As a result, much of the State and county-owned land formerly leased under the Pierce Act was sold or leased to individuals. The area of Pierce Act leases at the end of the year totaled 928,500 acres in 6 States.

APPROPRIATIONS AND ALLOTMENTS

Administrative funds provided by Congress for the fiscal year totaled \$1,047,740. Of this amount \$119,630 was for fire suppression and presuppression leaving \$928,110 for grazing district administration. In addition \$115,000 for construction and maintenance of range improvements, and \$8,500 for leasing of lands under the Pierce Act were available from direct appropriations. Allotments for emergency fire fighting totaled \$125,000 and for soil and moisture

conservation work \$492,500. Advisory boards contributed \$77,115.83 for range improvements. The Public Roads Administration transferred to the Grazing Service \$520,500 for construction and maintenance of access roads to mineral deposits and other war material in eight States.

FEES COLLECTED AND DISTRIBUTED

Earned grazing fees during the year totaled \$765,382.35, of which \$211.93 was deposited to the credit of Indians in Arizona and \$382,-585.24 was paid to 10 Western States for expenditure under State law. Grazing fee income for the year by States with the respective amounts paid to States shown in parentheses, are summarized as follows: Arizona \$40,059.14 (\$19,923.60); California \$19,767.67 (\$9,883.81); Colorado \$51,503.65 (\$25,751.84); Idaho \$77,851.91 (\$38,925.98); Montana \$52,961.47 (\$26,480.71); Nevada \$118,411.97 (\$59,206); New Mexico \$118,277.65 (\$59,138.80); Oregon \$52,035.92 (\$26,017.-97); Utah \$133,079.86 (\$66,539.95); Wyoming \$101,433.11 (\$50,-716.58). Earned fees in grazing districts for the 10-year period ending June 30, 1945, now total \$6,927,036.03, of which \$3,444,632.58 have been paid to the above listed States under provisions of the Taylor Grazing Act.

The Service continued to be hampered by a large personnel turnover, mainly in field and clerical positions. This affected chiefly the district and regional offices and reduced materially the output and the quality of pressing work. Excessive time of supervisory personnel was required in training new employees. Many costly delays in work programs were experienced due to lack of repair facilities and scarcity of materials and parts.

RANGE IMPROVEMENT

During the war the Grazing Service has maintained a policy of limiting its construction program to projects that were absolutely necessary to aid the production and handling of livestock on the range. Only 651 stock-water developments, 342 miles of truck trails, 125 miles of stock trails and driveways, and 390 miles of fence were built. On the other hand, strong emphasis was placed on the maintenance of range improvements previously constructed.

A summary of range improvements with accumulative totals is shown on table III at the end of the chapter.

SOIL AND MOISTURE CONSERVATION

Soil and moisture conservation activities were conducted on 55-project areas. Nine additional project areas were added during the

year resulting in a total of 114 active projects. Plans for rehabilitation were formulated on 12 areas which are pending approval. The new project areas approved entail revegetation of about 82,000 acres of depleted Federal range. Within active projects 24,000 acres of range reseeding was accomplished, and 150,000 acres were treated for rodent control.

FIRE CONTROL

Approximately 100,000,000 acres of Federal range are considered to be within the urgent fire protection zone as determined cooperatively by Federal, State, and private protection agencies. Fire records are kept by calendar years. A total of 297,481 acres of Federal land was burned over in calendar year 1944 as compared to 1,206,715 acres in 1942. In this 3-year period the average size of fires has been reduced from 1,537 to 674 acres.

ACCESS ROADS

Participation in the construction of access roads to raw materials needed for war continued throughout the year but on a reduced scale. A total of 326 miles of roads was constructed, bringing the total mileage to 1,896 in 3 years. Principal materials tapped by these roads are copper, lead, zinc, iron, coal, timber, oil, fluorspar, talc, manganese, phosphate, corundum, vanadium, tungsten, chromium, mica, gilsonite, and arsenic.

TABLE I.—Number of licensed operators and livestock in grazing districts by region, June 30, 1945

Region	Licensed operators	Cattle	Horses	Sheep	Goats	Total livestock

Fish and Wildlife Service

IRA N. GABRIELSON, *Director*

THE FUNCTION OF THE FISH AND WILDLIFE SERVICE

THE central function of the Fish and Wildlife Service is to effect and maintain an equilibrium of our native animal resources that will be most profitable to the most men. Ever since European man first landed on this continent, the forces of progress—i. e., growth of the population of man, the development of industry, the expansion of cities, the spread of highways, the facilitation of contacts with the rest of the world—have all constantly worked and will continue to work to destroy that profitable equilibrium.

VALUE OF ANIMAL RESOURCES

It is well worth the struggle and expense we must make to oppose such negative results of progress, especially since we can do this without opposing progress itself. Our national resources of birds, beasts and fishes, with the conservation of which the Fish and Wildlife Service is concerned, are valuable far beyond what can be expressed in dollars and cents. But if money be set arbitrarily as the whole criterion of worth, there are the following estimates on the fraction of United States fish and wildlife resources that can be evaluated from quantitative knowledge:

Resource:	Capitalized value (billions of dollars)
Water fowl.....	1. 5
Fur-bearing animals.....	. 4
Big-game animals.....	1. 3
Commercial fisheries.....	5. 8
Game fishes.....	5. 0
Total.....	14. 0

If now we take into account the unutilized resources, and such benefits as are rendered fields and forests by the insect control activities of birds, for example, and all the imponderable values, such as beauty and recreation, the amount derived above is perhaps no more

than a tenth of the grand total, which may therefore conservatively be set at somewhere around 140 billion dollars.

EFFECT OF THE WAR ON ANIMAL RESOURCES AND ON CONSERVATION

Unlike the nonrenewable resources, our continental fish and wildlife have not, on the whole been adversely affected by the war. If anything, they have been benefited by it, since fishing (except for certain commercial species) and hunting have been below peace-time normals. Offshore wildlife, on the other hand, has suffered from the war. Many populations of birds and mammals which frequent the shore, the open sea, and the oceanic islands have been seriously decimated. Thousands of auks, murre, puffins, sea gulls, and ducks have perished from the effects of oil on the surface of the sea, which penetrates the feathers and ruins them as waterproof coverings.

The transformation of small islands in the Pacific from jungles to war camps has seriously diminished the abundance of sea birds requiring those islands for nesting sites, and has perhaps even extinguished at least two species, the Laysan Island rail and Laysan Island finch. The use of certain coastal islands for bombing practice has destroyed the nesting grounds of many birds frequenting our shore. Unknown quantities of whales, the most valuable animal in existence, have been killed in the course of submarine warfare. It will take at least 5 years of observation to determine the extent of these losses and to effectuate measures for recovery wherever the possibilities of recovery appear hopeful.

The most serious effect of the war on the conservation of our animal resources has been the loss of trained personnel by Federal and State agencies. This effect evidenced itself as soon as men began to be diverted to war occupations, several months before hostilities actually commenced. During the war years, so few young men were in a position to take the college training needed to turn out competent wildlife managers and conservationists that virtually none have been available for apprenticeship in the Fish and Wildlife Service. Consequently, there is now a wide gap between the beginning grades and those filled by such of the older, well-experienced men as have remained in conservation work during the war, and there are not enough of the latter to fill all the supervisory positions that will be required for vital post-war projects.

With an ever-increasing number of returned war veterans seeking to establish themselves in civilian life, there is the opportunity as well as the need for the Federal Government to encourage those suitably inclined to take the college training required for any of the several

phases of conservation practice. This means that the Fish and Wildlife Service must cooperate with the universities in establishing and maintaining at a high standard of excellence, the kinds of courses which will produce the most effective men in this field.

During the war, the Federal Government has assisted in the training of visiting foreign students by granting generous traveling fellowships, paying living expenses and tuition in schools with curricula in fishery or wildlife biology. It is proposed here that similar fellowships be made available to United States citizens of promise. The choice of subjects for study and life work is exceedingly broad, as will be shown in the following account.

REFUGES

Among the activities of the Fish and Wildlife Service, none is more effective in wildlife conservation and restoration than a Nation-wide system of refuges. These are lands dedicated wholly to the propagation of wildlife by good management practices. From a modest beginning in the early part of the twentieth century, the system grew slowly for many years; and in the 1930's it was given great impetus by the allocation of special funds and by passage of the Migratory Bird Hunting Stamp Act. This act, which requires every duck and goose hunter over 16 years of age to buy a Federal migratory waterfowl hunting stamp, has provided annual funds ranging from half a million to nearly a million and a half dollars. Of this money, 90 per cent must be used for enlarging and maintaining the system; the remaining 10 per cent is available for the administration of the act.

In the past year, six areas, totaling in size over a million acres, were established as national wildlife refuges. These were located in Washington, Missouri, California, Florida, North Dakota, and Kentucky.

During the war years, the refuges have been operated on a strictly maintenance basis. With two thirds of all refuge personnel in the armed services, with construction at a standstill, and with maintenance reduced to the very minimum, water-control structures, patrol trails, buildings, etc., are deteriorating. An extensive program has been prepared for the rehabilitation of many of these developments, and for continuation and completion of the continental waterfowl refuge program.

It is estimated that about 25 percent of the ducks, geese, and swans in North America inhabit these Federal refuges. The value to the people of the United States in having these resources protected from the critical danger of extermination and in having them maintained in areas where conditions are most favorable to restoration, is estimated to be worth about 3 million dollars annually. The value of maintaining all of the other forms of wildlife in these areas—the non-

game birds, the mammals, the fish—cannot be measured from any quantitative basis, may amount to as much as an additional 3 million dollars annually.

FEDERAL AID TO STATE CONSERVATION AGENCIES

Of equal benefit to wildlife conservation has been the Federal Aid to Wildlife Restoration Act of 1937, designed primarily to increase and improve conservation work by the States. Under the terms of this act, the Federal Government may pay a grant to any State which has enacted certain legislative measures to promote conservation. This grant contributes 75 percent of the cost of work performed on approved projects concerned with the purchase and development of lands, the restoration of natural environment, and the prosecution of research into problems of wildlife management. The source of this money is the revenue from the tax imposed on firearms, shells, and cartridges. The amount thus collected is set aside in a special account, known as the Federal Aid to Wildlife Restoration Fund. The amount unused in any year may be left in the fund for future use.

As a consequence of wartime shortages of personnel, equipment, and materials, this program has proceeded on a greatly reduced scale during the last 4 years. Last year, for example, the total Federal grant was only \$900,000—the lowest to date; and by June 30, 1945, nearly \$11,000,000 had accumulated in the fund.

Judging from experience after the First World War, it is anticipated that the number of hunting licenses sold will increase by about 30 percent during the next few years, and Federal and State programs of wildlife management will have to be intensified accordingly. The International Association of Game, Fish, and Conservation Commissioners at its June 1945 meeting in Chicago passed a resolution favoring the appropriation of the aforesaid accumulated funds over a 5-year period, in addition to the regular annual deposits put into that fund.

EFFECT OF DDT ON WILDLIFE

World War II has brought into production and use a new insecticide known popularly as "DDT," dichloro-diphenyl-trichloroethane. This potent material has been used widely by the Army and Navy for control of pest- and disease-carrying insects in war theaters, chiefly in the Pacific. Unfortunately DDT has been found to be an unselective poison. It may kill, under certain conditions, a great variety of animal life, including birds, reptiles, and amphibians; and preliminary indication of this from laboratory tests has led to intensive studies to evaluate the damage that may result to wild animal life when forest, marsh, and agricultural areas are sprayed with DDT solutions. The

Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture has recognized the potential hazard in widespread use of DDT and has entered into a cooperative agreement with the Fish and Wildlife Service to aid in appraising the biological consequences of applying it. Various types of applications in various concentrations have been tried on experimental plots, some of which have been as large as 3,000 acres. Biologists of the Service are now intensively studying the effects of these experimental treatments on fish, birds, mammals, and other vertebrates. The objective of these studies is to find out what doses and formulae can be used with minimum damage to fish and wildlife.

PEST CONTROL

DEVELOPMENT OF A NEW RODENT POISON

Notable progress was made during the year in the search for new rodenticides through the development of a compound which already has become widely known under its laboratory serial number, "1080." This material, sodium fluoroacetate, is extremely toxic to rodents as well as to certain other mammals and birds. It is readily soluble in water, has only a slight taste in the dilutions in which it is commonly used, and lends itself well to most of the methods used in bait preparations for domestic rats and mice and for field rodents.

In the Southern States "1080" already has made an excellent record in the experimental control of Norway, black, Alexandrine, and frugivorous varieties of rats.

There still remain many aspects of the use of "1080" to be investigated. Its high toxicity portends possible dangers not only to persons who handle it but also to beneficial forms of wildlife that might be endangered in its field application. Studies are being pressed to the limit of available personnel and with the generous help of cooperators throughout the country, as well as of members of the armed services engaged in problems of rodent control abroad.

Correlated with the search for new rodenticides has been the continued effort to make the use of poisons as safe for beneficial or harmless wildlife as is humanly possible. Research is in progress in the use of color to make rodent bait unattractive to seed-eating birds without impairing its attractiveness to rodents. Results so far appear promising and already are being given practical application in field operations.

RED SQUILL

At the close of the fiscal year the national and international situation with respect to red squill, the source of the most important rodenticide for domestic use, was materially improved over that of a

year ago. Thanks to numerous importations from the Mediterranean, the stock pile of squill in this country was increased to approximately a million pounds. Not only did the importations exceed in poundage those of any previous year, but the quality of the raw chips received was superior to that obtained in other recent years. Much of the material revealed a high enough toxicity to permit a reduction in the price of fortified squill. Determinations of the toxicity which led to these developments were made largely in the laboratory of the Fish and Wildlife Service. Samples imported from Italy were found to be comparable in toxicity to those from Algeria, whereas samples from Spain proved, as in former years, to be wholly nontoxic.

PREDATOR CONTROL

Meanwhile, the Fish and Wildlife Service has continued its program of organized hunting throughout the country for the reduction in the abundance of coyotes. This work is carried on primarily to reduce predation of livestock. During the past year, however, an epidemic of rabies among dogs, coyotes, and foxes has necessitated an intensification of this program.

The Service has also contributed greatly to the suppression of typhus, a disease endemic in the South, through its rat control work, carried on in cooperation with the States.

DEVELOPMENT OF THE RABBIT INDUSTRY

The shortage of meat during the war stimulated the development of a rabbit industry, which now gives evidence of continuing growth in the future. This new industry owes a considerable part of its success to the work of the Fish and Wildlife Service Rabbit Experimental Station at Fontana, Calif. There research is carried on to improve methods of managing, feeding, and breeding rabbits; and the results of these studies are made available to the public in a series of booklets. As a result of this research, domestic rabbits now outclass their ancestors of 10 or 15 years ago. They have better meat, finer fur, are more economical to feed, less subject to disease, and breed more true to color, size, and shape.

Small business characterizes the United States rabbit industry, most of the meat, fur, and wool being produced in small rabbitries whose owners devote only part of their time to the project. The amount of meat produced is impressive, being somewhere between 15 and 20 million pounds in 1944.

ALASKA FUR SEALS—AN EXAMPLE OF A WELL-MANAGED RESOURCE

One of the finest living examples of an animal resource that was once depleted by imprudent exploitation and restored by good management is the Pribilof Islands (Alaska) fur-seal resource, over which the Fish and Wildlife Service has jurisdiction. Virtually unaffected by the war, the fur-seal herd has continued to yield close to normal returns.

The fur-seal industry, estimated to be worth \$100,000,000, has returned nearly \$20,000,000 as net proceeds to the Treasury since 1867. From a low of about 130,000 seals in 1910, the herd has been restored through wise management practices to 3,000,000 animals, and is providing the Government with an annual net income of over a half-million dollars.

Rehabilitation of the 500 inhabitants of the Pribilof Islands, who were returned to the islands in May 1944, made possible the resumption of fur-sealing and related activities upon a normal basis. Sealing operations, however, were somewhat disappointing; the herd as a whole was late in arriving at the islands after their customary winter sojourn to the South. Furthermore, for some reason yet to be discovered, the 3-year-old males, the class from which nearly all killings are made, did not haul out in normal numbers, and the resulting take of 47,652 skins was less than anticipated. Other elements of the herd, however, appeared in usual numbers.

Of the sealskins taken, 20 percent, or 9,530, were delivered to a representative of the Canadian Government at Seattle, Washington, in accordance with the Provisional Agreement of 1942 between the United States and Canada, and the remainder were sent to the Fouke Fur Co. at St. Louis, Mo., for processing and sale.

During the year two public auction sales were held at St. Louis for the account of the Government. At the auction held October 9, 1944, 22,393 dressed and dyed skins, and 169 unfinished skins were sold for a total of \$823,500.75.

On April 9, 1945, there were sold at public auction 22,682 dressed and dyed Pribilof Islands sealskins and 4 confiscated sealskins for a total of \$811,992.75. In addition, there were sold at private sales or promotional purposes under special authorization, 214 dressed and dyed skins for \$8,467.50. All of the sales were made at ceiling prices established by the Office of Price Administration.

THE MENACE OF POLLUTION

The distribution of all animals is controlled by the distribution of water. Even the most desiccated looking desert creatures, whose bodies are magnificently adapted to living in dry climates, cannot live permanently without it. Furthermore, each kind of animal depends for its living on a particular water habitat. Desert-dwellers cannot live in marshes; marsh-dwellers cannot survive in open lakes. Any change, however slight, in the water or the environment surrounding it affects the animal populations depending on it. But the progress of industrialization in the United States depends on the distribution of water. For various reasons, industrial centers tend to become established close to large rivers, or bays on the seacoast; and from the beginning, they have defiled those rivers and bays with sewage and factory wastes. The effect on animal resources has been so wastefully destructive that pollution is now one of the most serious and complex of conservation problems occupying the attention of the Fish and Wildlife Service.

The Service has for the past 10 years carried on a series of experiments in various parts of the country to establish minimal standards of water purity necessary for the support of aquatic life. The information is required as a basis for effective control measures. It has been established that stream pollutants, regardless of their source, can be grouped into three classes: those which disturb the balance and general conditions of nature required to maintain aquatic life; those which have specific toxic action on fish or other aquatic life; and those which combine both hazards.

The first group includes various effluents, both municipal and industrial, which reduce the dissolved oxygen, alter the acid-base balance of water, increase turbidity and reduce light penetration, blanket the bottom with unproductive materials, or otherwise disturb general stream conditions. The second and third groups may be considered together because of the common hazard of toxicity to living things. In these groups are various metallic poisons, dyes, organic compounds and sulfur derivatives, noxious gases such as chlorine and methane, and compounds like cyanids which enter streams as by products or wastes from numerous types of manufacturing activities.

During recent years effluents of these types have been increasing in quantity and have been introduced into new areas as a result of the expansion and dispersion of industry of all types, particularly war-munitions manufacture. To an already long list of known harmful wastes known to be harmful to aquatic life have been added many new kinds and additional quantities of harmful wastes from explosives plants, rayon mills, and synthetics manufacture. Not only has

quantity of waste materials increased from these processes, but, under the pressure of war, and with the shortage of materials for the construction of treatment and purification equipment, less attention has been given to either the recovery of useful and valuable byproducts, or to the treatment of harmful wastes for which no profitable market has been found.

It is extremely difficult to establish national standards of water purity necessary to safeguard aquatic resources. Experiments conducted by the Fish and Wildlife Service over many years have demonstrated that even the lethal limits of many specifically poisonous substances cannot be defined. This is because slight changes in the acidity or salt content of water, the dissolved oxygen, and the natural ability of water to neutralize acids, will materially alter the toxicity of many compounds. Copper sulfate, for example, was found to be toxic to most fish and aquatic animals in the water of one stream even when diluted with 4 million parts of pure water, while in another stream a concentration four times as great was readily tolerated by the same species because of differences in the amounts of other dissolved salts carried by the two streams.

Instead of being subject to uniform Nation-wide standards of water purity which government and industry could apply confidently, each stream or river basin presents individual problems which must be studied on the ground. Pollution abatement practices must be developed for each particular situation if our aquatic resources are to be protected.

Thus pollution is controllable only on local and State levels. At the same time, it is a national problem and it is the duty of the National Government to furnish guidance for the abatement of this nuisance. During the past year, the Fish and Wildlife Service has compiled the results of its long study on this subject in a bulletin entitled, "The Determination of Water Quality." This work, now in press, is designed to serve as a guide to those engaged in pollution control.

EFFECT OF WATER UTILIZATION PROJECTS ON ANIMAL RESOURCES

During recent years, a movement has been gathering momentum to develop all the inland waterways to their fullest extent, so as to utilize, by means of systems of dams, the flow and gradient of each river and its many tributaries to serve the purposes of navigation, irrigation, power and flood control. Although this development will undoubtedly proceed over a long period of time, a number of major constructions are planned to be under way in various parts of the country within the next five years.

The Fish and Wildlife Service is one of several Government agencies that are working together to achieve the maximum national benefits from these projects. Its particular function in this respect is to devise means of minimizing the inevitable damage which animal populations living around the affected water courses must suffer when their environment is changed. Like the pollution problem, no rules or principles exist or could ever be devised to solve the conservation problems of all water-use projects. When a single dam is considered by itself, it is usually possible to devise modifications that will help a migrating fish population like salmon to surmount it with no serious losses. When one dam is followed by a succession of others, blocking the upper reaches of a stream where the spawning grounds are located, the conservation problems become acute indeed.

An example of such a situation is the Columbia River, where a vast system of water-use projects is under development. One unit of this system is the Bonneville Dam, completed in 1938. Scientists of the United States Bureau of Fisheries (now part of the Fish and Wildlife Service) effected the safe passage of salmon over this dam by means of "fish ladders"; that is, a rising succession of pools, which the fish can easily traverse. A second unit of this system is the Grand Coulee Dam, which is too high for the salmon to surmount by any device. Here the fish were trapped and thence hauled overland by truck to tributaries below the dam. This bold experiment was attempted for the first time in 1944. The salmon were transplanted according to plan, they ascended the tributaries into which they had been introduced, and spawned successfully; and their young, guided by the memory of their infant experience, will return naturally to their adopted tributaries.

Getting the young salmon downstream with minimum mortality is another problem to be solved. Experiments designed to determine the extent of the mortality of downstream-migrating juvenile salmon in passing Bonneville Dam were continued by the marking of fingerlings and liberating them above and below the dam. Returns to date indicate considerable variation in mortality, ranging from 5 to 50 percent, and further studies are needed on the subject.

Meanwhile, special attention is being given to the various water-use projects proposed for the Columbia River Basin and their probable effect on the fishery resources. Ways and means of successfully caring for the fish at each structure or series of structures are being devised. A vastly expanded program of investigations has been formulated to obtain information necessary for the maintenance of the fishery resources under the proposed new conditions and preliminary studies are under way.

A similar plan of salvaging salmon at the Shasta Dam in California has been seriously hampered by the war. Because of a shortage of

materials and manpower, fish trapping facilities could not be in readiness in 1943 when the spring salmon were blocked by Keswick Dam. Operations did not start until June 1 of that year and many of the salmon died below the dam. The effect of this delay in trapping and transferring the accumulated salmon will not be known until 1947, but it is certain that a portion of the spring run was lost. Such losses are extremely important, especially since the Sacramento River salmon fishery will have to be managed very intensively to achieve results comparable to those existing before the construction of Shasta Dam. It is estimated that the salmon maintenance program below Shasta Dam will be worth \$2,000,000 per year to the fishing industry.

The second full year of operation of the Shasta salmon salvage program was considerably better than the first. Permanent equipment and facilities eliminated many of the difficulties of the previous year. The chinook salmon run into that portion of Sacramento River within the salvage area during 1944 was greater than had been anticipated.

ARTIFICIAL PROPAGATION OF FISH

From the Service hatcheries, fish and fish eggs totaling 5.7 billion valued at about \$3,000,000, were released in the Nation's streams, lakes, and salt waters.

With the beginning of the war these activities were adjusted to place special emphasis on propagating the species of fish that contribute most to the food program. Among these were the salmons of the Pacific coast and the warm-water fishes which are used in stocking farm ponds. While the total output of fish and fish eggs from Federal hatcheries for the calendar year 1944 was slightly less than in 1943, there were increases in the production of commercially important chinook, silver, and sockeye salmons. The demands for spiny-rayed fishes, especially largemouth black bass and bluegill sunfish (the two species that have proved most useful in stocking farm ponds) surpassed production; for during the last half of the year the number of requests for fish with which to stock ponds was over 200 percent higher than in the comparable period of the previous year.

ALASKA FISHERIES

In Alaska the Fish and Wildlife Service exercises direct jurisdiction over the animal resources. In order to obtain the information needed for effective management of the fisheries, scientific studies of fish biology are in continuous progress. Under wartime conditions, lack of facilities and of trained personnel have resulted in these investigations being conducted on such a restricted scale that only a minimum of information has been obtainable in recent years.

CONSERVATION OF RED SALMON

Management of the red salmon fishery in Bristol Bay to insure a continuing high yield requires that enough fish escape the fishery to keep the population continually reseeded. To accomplish this, certain restrictions are imposed on the fishery, based on estimates of the probable size of run into each river system. During the past year, collections of catch records were maintained, and aerial surveys were again carried on over the entire Bristol Bay watershed to establish the magnitude of the run into each river system. This was done so as to determine whether or not the regulations limiting the catch were effective and also to provide a basis for estimating the probable return into each system when the progeny of this escapement have matured. As a part of this program a counting weir was again operated at Brooks Lake on the Naknek river system where an accurate count of the escapement into that portion of the watershed could be obtained.

At Karluk River, important in the production of red salmon, the catch is not permitted to exceed the escapement of spawners into the river. In order to effectuate this requirement, records of the catch in the area were maintained, and a counting weir was operated to obtain an accurate count of the fish entering the system to spawn. Surveys of the several tributaries to the Karluk Lake were made to evaluate the degree of utilization of spawning gravels.

In addition, the age composition of the stock was estimated by sampling the commercial catch. These data were used to calculate the ratios of return to escapement, information essential to determining what constitutes an adequate escapement and to predicting the magnitude of future runs.

CONSERVATION OF PINK SALMON

Studies of pink salmon in southeastern Alaska continued on a reduced basis. At the Little Port Walter Biological Station studies of the rate of infant survival were maintained, including annual counts of the spawning adults in the fall and of their progeny which migrate downstream in the spring. An unbroken series of these data are of primary importance to an understanding of the fluctuations in abundance which occur in this species.

CONSERVATION OF ALASKA HERRING

The value of the conservation policies employed in the Alaska herring fishery is demonstrated by a further increase in yield during the past year. A total of 107 million pounds were produced in 1944 as compared to 84 million in 1943 and 38 million in 1942.

Catch quotas, based on estimates of abundance in the coming season, were established for each of the three principal fishing districts.

Because the year broods produced in 1939, 1940, and 1941, which would support the fishery in 1944, were known to be above-average in abundance, an increase in quotas was recommended. Everywhere higher catches per fishing day and a higher total catch than in any of the past several years, corroborated these predictions. From mortality studies it is known that these same year broods, properly utilized in accordance with conservation principles, may be expected to survive in significant numbers through their ninth year of life. Under these terms there is promising evidence that this fishery may eventually be stabilized at an even higher abundance level.

CONSERVATION OF ALASKA SABLEFISH

An investigation of the sablefish of southeastern Alaska has revealed that a serious decline in abundance of this species has occurred. The return per unit of effort in 1944 was less than 40 percent of that which was obtained a decade ago. In spite of this low return, the incentive of high price has served to increase the fishing intensity, thus further reducing the abundance. As a step toward the rehabilitation of this resource, a closed period, intended to reduce the fishing intensity, was imposed in 1944.

MANAGEMENT OF OYSTER RESOURCES

From the viewpoint of conservation, oysters are peculiarly interesting because they can be cultivated like agricultural commodities, and their abundance and quality can be controlled with all the exactitude of properly run business enterprise. The development of oyster farming methods in the United States is an achievement of the Fish and Wildlife Service. The constant improvement of these methods is an important part of the Service program.

The war years have imposed severe hardships on the oyster industry. Shortage of manpower, difficulties of keeping boats in repair, military restrictions on oyster-producing areas, increased sewage pollution in regions where populations of war workers have flourished, have all tended to depress oyster production. For example, in the Hampton Roads area, the extent of pollution caused public health authorities to close planted grounds containing 2.6 million dollars' worth of market-sized oysters. This action led the Fish and Wildlife Service to conduct special bacteriological studies to determine the trend of pollution and the direction of its spread in the lower part of the bay. These studies have demonstrated that temperature and weather influence the bacteriological quality of water to an important degree; and they proved the necessity of partial purification, at the very least, of all sewage before it is dispersed in the bay.

Previous studies of the Service clearly demonstrated the need of

managing public oyster grounds for their conservation and development. In cooperation with the Maryland Department of Tidewater Fisheries, the Fish and Wildlife Service conducted intensive ecological observations on the principal public reefs in the Maryland part of the bay. From field observations, the time of spawning and setting, the rate of growth, the size composition of the oyster population, and the quantity of oyster pests were determined. These data, summarized and analyzed, were made available to appropriate State officials with recommendations regarding opening and closing of grounds, time of planting shell, methods of controlling oyster pests, and other information pertinent to a well-operated program of State management. In accordance with these recommendations, grounds which had been closed to the fishery were reopened for a limited period. At a time when protein food was scarce, this action contributed an additional 640,000 pounds of oyster meat to the market. It also added \$400,000 to the income of oyster growers. This was done without in any way damaging the potential productivity of the reefs.

CONSERVATION OF MARINE FISHERY RESOURCES

The great sea fisheries along the United States coasts have provided the Nation with an average of 4.2 billion pounds of food annually during the war. The biological study of these resources, to determine the facts needed to utilize them to their fullest capacity in accordance with conservation principles, is one of the major activities of the Fish and Wildlife Service.

THE HADDOCK

Among the most valuable marine fishes is the haddock, which yields an annual catch worth about 9 million dollars to American fishermen. This species has shown evidence of declining abundance on the principal New England fishing grounds which supply the bulk of the catch. Preliminary analysis of abundance indices, size, and age data show that the 1941, 1942, 1943 year classes on Georges Bank were relative failures. This caused some reduction in yield during 1944, which will become increasingly serious in 1945 and the first part of 1946. Various factors responsible for the failure of these year classes are being evaluated to determine the best way to make use of available stocks and, if possible, to prevent a recurrence of such a series of failures.

FLOUNDERS

The flounder stocks yielded a catch worth nearly 4 million dollars in spite of a serious decline in the production of the yellowtail flounder, which furnishes the major part of the flounder catch. Research efforts were concentrated on the collection of data covering the pos-

sible factors causing the decline. Analysis of the changes in the density, age, and size composition of the populations have been started, making use of age determinations from the scales and other techniques worked out during the past year.

ROSEFISH

Production of rosefish continued at a high level with a catch worth about 4½ million dollars, coming principally from Northern Gulf of Maine and Eastern Nova Scotian Banks. Study of fish scales and length composition showed that in both of these areas growth is very slow, the fish reaching a length of less than 9 inches in 10 years. After the first 1 or 2 years, growth is only 0.6 to 0.8 inch a year. Most of the fish do not mature until they are more than 9 inches in length. Accurate age readings for the older fish have not yet been established. In spite of the concentrated and intensive fishery there have been no striking changes in the average catch-per-day, but this appears to be the result of increased efficiency of fishing operations rather than to the maintenance of the fish populations at a constant level.

LOBSTER

The lobster catch, particularly that in Maine waters, has increased greatly since 1940; the 1944 landings in that State alone totaled about 14 million pounds and brought the fishermen about 4¾ million dollars. Analysis of the size composition of the lobster population has shown that, in part, this increased catch is the consequence of the increased size limit, in effect since 1942.

ATLANTIC SALMON

Studies on Atlantic salmon were limited to continuing the marking and stocking experiments begun in 1942. This program was designed to evaluate the various factors involved in restoring salmon, and to prepare for an expanded program in 1946. A total of 94,000 Atlantic salmon of various ages were planted during the year in the St. George and Penobscot Rivers; and 32,000 silver salmon from the Pacific coast were planted in the Pemaquid and Ducktrap Rivers.

CONDITION OF STOCKS OF FISH ON NEW ENGLAND BANKS

At the close of the fiscal year, most of the stocks of fish on the New England Banks, which during 1944 yielded the fishermen well over 40 million dollars, were in relatively good condition (compared to their prewar status), except for yellowtail flounders, Georges Bank haddock, and possibly a few others. However, the great increase in the fishing fleet during the past year will put an unprecedented drain on these stocks of fish.

PACIFIC PILCHARD

During the middle 1930's pilchard fishing along the Pacific coast was intensified through growth of the fleet of large purse seiners, increasing the exploitation $2\frac{1}{2}$ -fold and doubling the yield. For the 9 years of this high-fishing rate a fairly stable yield has been maintained by self-renewal. Biological work of the Fish and Wildlife Service has proved that this depended largely on sea conditions favorable to reproduction and survival of young for a number of seasons prior to 1940, and has suggested that during more recent years (1940-43) less favorable renewal conditions prevailed. Because the young from these years have not yet reached commercial maturity the full effect of these circumstances are not yet discernible. It remains to be seen whether this great biological resource yielding more than one half million tons of fish annually can hold up under the combination of moderate or poor reproductive conditions with the present high fishing rate. Unfortunately the research on this and related questions has been materially retarded during the last two years through cessation of sea work and diversion of personnel to war-emergency activities.

PROMOTION OF UTILIZATION

Conservation is concerned as much with the proper exploitation of animal resources as it is with their protection, since they have their maximum value to us only when they are fully utilized. It is one of the functions of the Fish and Wildlife Service, therefore, to promote the fullest utilization of the fishery resources. This it does by collecting and disseminating statistical and economic information, by carrying on research to improve techniques of catching and processing fish, and by working to enlarge markets for fishery products.

STATISTICS ON PRODUCTION

To serve the daily commercial needs of the fishing industries, the Fish and Wildlife Service collects current information on landings of fish at the various ports, on the volume of stocks held in cold storage, on shipments from producing areas, and on prices in central markets. Thus fishermen on Long Island, in North Carolina, or in Florida, for example, are given a basis for judging the demand in New York City, Boston, or Chicago. Likewise distributors in those cities are apprised of shipments of salmon and halibut from Seattle and Prince Rupert, or of shrimp from Biloxi, long before the shipments arrive. This service is designed to expedite trading and to obviate commercial gluts and famines.

During the war years this market news service was augmented by complete coverage of war orders issued by the Office of Price Admin-

istration, War Production Board, War Food Administration, Office of Defense Transportation, and other agencies whose activities affected the fisheries. Special issues of Fishery Market News, a periodical issued by the Fish and Wildlife Service, were devoted to listing O. P. A.'s maximum fish prices, and were used continuously by fish merchants throughout the war.

RESEARCH ON TIN SUBSTITUTES

Early in the war, the shortage of tin plate forced manufacturers of metal food containers to use substitute metals, chiefly various steel plates. These were treated chemically or with lacquers to prevent corrosion when packed with fresh or processed food products. An important project of the Fish and Wildlife Service, then, was to test these wartime containers by actual use. Results of these tests, which were performed on a wide variety of materials, were used as a basis for action in fish processing plants. Our technologists also tested fiber containers which were treated with such waterproofing materials as paraffin wax and beeswax. From these studies, recommendations were made to the fishing industry on types of materials found suitable for the transportation of fishery products.

RESEARCH ON METHODS OF SAMPLING FISH LIVERS

Early in the experimental work on vitamin-A rich shark livers, Fish and Wildlife Service technologists found that within the liver of each fish there is wide variation in the percentage of oil and in the vitamin-A potency. The earliest method of sampling for the determination of vitamin-A potency, which is the basis of the selling price, consisted of cutting sections from the liver. This method was inadequate, since a slight variation in the amount of oil contained in the livers would entail a considerable loss either to buyer or seller, depending on the direction of the variation. It was obviously necessary to devise a sampling method which would more accurately represent the total oil and vitamin content. This was a problem undertaken by the Fish and Wildlife Service at its Seattle laboratory. Extensive study and tests produced a device which takes a core sample down through the 5-gallon can containing the liver, and obtains quickly a sample representing the entire contents of the can with 95 percent accuracy. This device, now being patented under a public patent, is in wide demand by vitamin processors.

DEVELOPMENT OF QUICK-FROZEN PRECOOKED FISHERY FOODS

A newly developed product which promises to modify our living habits in the future is frozen, packaged cooked food. This has found wide use during the war for serving on board transport planes and in battle areas where it was not feasible to set up kitchens. Not all

cooked dishes remain palatable when frozen. Some mixtures become undesirably tough and leathery; hence special recipes must be developed. In response to a request from the Army Quartermaster Corps Subsistence Research Laboratory, the Fish and Wildlife Service developed a large number of recipes utilizing fishery products which are suitable for freezing.

The results of some of these tests have been published and others are being prepared for publication. Meanwhile, several commercial fishery firms are marketing precooked, packaged, frozen fishery products.

MARKET DEVELOPMENT

At the end of August 1944, cold-storage warehouses throughout the country were stocked to capacity, fishery products alone amounting to a record total of about 123 million pounds. Army food authorities expressed concern over the situation and sought assistance in relieving the storage glut so that space for Army food stocks would be freed.

The Fish and Wildlife Service, in cooperation with the War Food Administration, immediately sponsored, planned, and executed eat-more-fish campaigns in several eastern cities. In these campaigns, which lasted 2 weeks to 1 month, posters, newspapers, radio broadcasts, car cards, and other media were utilized. Recipe books, leaflets, and bulletins containing marketing information about fishery products were distributed.

At the conclusion of the campaigns, fish dealers and retail food stores reported increases in sales amounting to 10 to 70 percent over previous similar periods.

VALUE OF THE FISH AND WILDLIFE SERVICE

In the foregoing pages, it has been shown by a series of illustrations that the Fish and Wildlife Service enlarges national wealth through a variety of activities. To summarize these in general terms, the Service:

- Increases the stocks of fish and of wildlife;
- Resists depletion of our animal resources;
- Enlarges knowledge about them;
- Improves and extends the use of them.

It is obviously as difficult and elusive a problem to evaluate these effects in dollars and cents as it is to evaluate the resources themselves. Yet an estimate has been made from such quantitative sources as are available. This estimate places on the total of these activities a value in the order of 30 million dollars a year.

Office of the Coordinator of Fisheries

IRA N. GABRIELSON, *Deputy Coordinator*

AMERICA'S fishery resources have emerged from the strain of war as a vital element in the national life. During the period of hostilities they have been called upon to make large and essential contributions to the war program. This they have done. And not only have the Nation's aquatic resources provided, in larger quantity than was thought possible, the protein foods, vitamin oils, and numerous industrial materials needed for war, but they have been maintained in essentially sound condition and now stand ready to play new and increasingly important roles in the postwar period.

Likewise, the condition of the industry which makes these resources available to the Nation is good. In sharp contrast to the difficult days of 1942, when the fishing fleet had been crippled by the unavoidable requisitioning of 700 of its finest vessels for military operations, the industry now has the largest and most efficient fleet in its history. Some of the recent inventions and discoveries in the fields of science and engineering have already become part of the equipment of these boats; other developments, hitherto withheld from commercial use for security reasons, will soon become available and will give the fleet a vastly extended range and adaptability.

The part played by the Office of the Coordinator of Fisheries in bringing about the favorable condition of our aquatic resources and of the fishing industry now may be recorded in full.

The primary task which was assigned the Coordinator's Office upon its establishment in 1942 was that of restoring and maintaining the productive capacity of the fishing industry.¹ That capacity had been badly shattered by the events of the first months of war. Yet if fish, shellfish, seaweeds, and other aquatic products were to be produced in quantities at least approximately equivalent to the wartime need, the facilities of the industry had to be restored and maintained at a high level.

¹ The Office of the Coordinator of Fisheries was established by Executive Order 9204, July 21, 1942. Under the original order it was authorized to coordinate fishery policies, plans, and programs; this broad directive was later considerably extended and clarified by Food Directive No. 2, issued by the Secretary of Agriculture on February 8, 1943, under which the Coordinator of Fisheries received specific authority over the production of fishery products.

In all efforts to achieve adequate production, however, it was essential to guard against reckless squandering of our resources for a short period at the expense of the future. When the Coordinator's Office undertook its task, no one could foresee within even approximate limits how long the war would last. The fisheries are a renewable but exhaustible resource. The lessons of the last war were fresh in the minds of fishery administrators. At that time the valuable Alaska salmon fishery was overfished to provide a quick supply of food, and thereby suffered damage which has been repaired only after years of effort. The Coordinator's Office therefore adopted, and consistently maintained, the policy of protecting the fishery resources against excessive drains which would endanger their continued productivity, not only for whatever period the war might continue but in future years as well. In carrying out this policy, the Coordinator's Office opposed the removal or relaxation of conservation regulations for the sake of immediate, short-term benefit when it was believed that the permanent public interest would suffer thereby. The satisfactory condition of the fishery resources after 3½ years of war is evidence of the wisdom of this policy.

PROVIDING THE MACHINERY OF PRODUCTION

While protecting the basic soundness of the fishery resources, the Coordinator's Office assisted the industry to build up its machinery of production. The fishing fleet had been reduced to critically low levels immediately after the entrance of America into the war. By the summer of 1945 it had been restored to its full prewar size, and its efficiency had reached the highest point in the history of the industry.

The rebuilding of the fleet was accomplished by authorizing construction by the industry of more than 2,000 new fishing craft and by demonstrating to the Army and Navy the need for the return of as many as possible of the vessels that had been requisitioned for military service early in the war. Working in close cooperation with the War Production Board, the Coordinator's Office arranged for adequate quotas of gasoline and Diesel engines to provide power for newly constructed vessels and replacements in old vessels. In addition, it assisted in providing engines and motors of various types, pumps, refrigeration equipment, and machinery for canneries and other shore plants.

In connection with the building program and with repairs and replacement of fishing equipment, the Coordinator's Office arranged for allotments of controlled materials, including steel, copper alloys, and aluminum, at the average rate of \$10,000 worth of materials per vessel (for the period from May 1943 through June 1945) or a total of more than 9 million dollars' worth of materials.

Of the 2,002 vessels that had been authorized for construction by June 30, 1945, many were already fishing at that time and all but 85 were scheduled for completion by the end of 1945. In only a few classifications of vessels—notably tuna clippers and large New England otter trawlers—was the fleet still below the prewar level at the end of the fiscal year 1945. The tuna clippers were necessarily among the last to be replaced by new construction and by June 30, 1945, none had been returned by the military services. These vessels, which are among the largest and fastest of the fishing boats, require an especially large amount of materials and equipment.

About a fourth of the new vessels are shrimp trawlers, for use in the major fishing industry of the South Atlantic and Gulf Coasts. Because of the greater range and modern equipment of these new boats, the efficiency of the shrimp fleet has been greatly increased.

Many large otter trawlers, especially from the New England fleet, were requisitioned for war service. They proved so valuable for military purposes that some are still retained. However, the new medium trawlers and draggers replaced them so effectively that many records for production were broken early in the 1945 season.

Throughout the entire war period, the situation with respect to nets, hard-fiber twine, and cordage remained tight. Requirements of netting for camouflage purposes were heavy. By careful surveys of the needs of the various fisheries and scheduling of orders well in advance of the fishing season, it was possible to avert any major shortage of fish nets which would have interfered with production.

THE MANPOWER PROBLEM

The manpower shortage, both of fishing boats and in fish-processing plants, was acute throughout the war, becoming progressively more serious as more and more of the highly skilled fishermen were refused deferment. Through its membership on the Inter-Agency Committee the Coordinator's Office was able to demonstrate the irreplaceable status of some of these men, whose skills had been attained through long experience and whose knowledge was indispensable to the effective performance of the fishing boats. Deferment was obtained for some captains and mates, even in the younger age groups. While in general it was possible to recruit enough crew members to keep the available boats in operation, there were isolated instances where boats remained idle because there were no crews to man them. In the food-processing plants, the shortage of workers was so acute as to act as a brake on production at various times and places, especially in the sardine canneries of both the Atlantic and Pacific coasts.

PRODUCTION PROGRAMS FOR THE MAJOR FISHERIES

Throughout the greater part of the war period, the salmon and pilchard fisheries, which together produce about one-third of the total poundage of fish taken in the United States, operated under production programs administered by the Office of the Coordinator of Fisheries. The Alaska salmon fishery operated under such a program in 1943, 1944, and 1945. The much smaller salmon fishery in Puget Sound was placed under a similar program in 1944 and 1945. The pilchard production program under the direction of the Coordinator's Office was undertaken in 1943. These programs enjoyed the active cooperation and approval of the great majority of the fishing industry which each season requested the continuation, and in some instances the extension, of the programs.

ALASKA SALMON INDUSTRY

The production program applied to the Alaska salmon industry, the operating units of which are scattered over vast distances of the Territory, was in effect a consolidation which brought about a pooling of the available resources of manpower, boats, and canning equipment. This was done by concentrating the canning of salmon at certain key centers, and providing for the joint utilization by the various firms of the available facilities of production.

The consolidation was made necessary by the fact that the armed forces had taken over a large percentage of the tenders and power scows used by the industry in Alaska waters and also because not more than 50 or 60 percent of the normal supply of labor was expected to be available.

The concentration order for the 1943 season provided for the canning of the year's catch in 74 (later increased by amendment to 77) of the largest and most modern plants rather than the 120 plants previously used, and reduced the number of lines of canning machinery from 226 in 1942 to 131, with provision for maximum use of the high-speed machines.

The concentration program was designed to accomplish: (1) A reduction in manpower requirements by about 5,000 persons; (2) reduction of north-bound passenger accommodations by approximately 4,000 persons; (3) reduction in north-bound tonnage by 17,742 tons; (4) reduction in floating equipment by 86 tenders and 50 scows; (5) reduction in fishing apparatus by 48 traps, 25 purse seiners, and 67,130 fathoms of gill nets.

The program was considered so satisfactory that at the close of the 1943 season representatives of the salmon industry requested the Coordinator of Fisheries to take immediate steps toward a continua-

tion of the plan in 1944. It was felt that the consolidation had saved the industry from becoming involved in ruinous competition for labor, transportation space, and equipment. As a result of its operation, the industry was able to increase its production of canned salmon, even though operating fewer plants, with less labor and less equipment than it would have used under normal conditions.

Because the situation, especially with respect to boats and equipment, had eased somewhat by the spring of 1944, the concentration program for that season was more liberal than that of 1943 in that it authorized the operation of 89 plants compared with 77 the previous year. Other important changes in the 1944 order were the assignment of manpower quotas to the various canneries, the quotas having been established previously by the War Manpower Commission. The 1944 order also provided that all persons, companies, and corporations authorized under the terms of the order to engage in salmon canning must obtain a license from the Fishery Coordinator.

The concentration program followed in 1945 was essentially similar to the 1944 order.

PUGET SOUND SALMON INDUSTRY

In order to save manpower and equipment, the Puget Sound salmon canning industry was placed under a concentration order at the beginning of the 1944 season. The concentration was effected at the request of the industry, in order that wartime operations in the Puget Sound salmon fisheries might be conducted as advantageously as those in Alaska.

The number of plants canning salmon in Puget Sound in 1944 was reduced from the usual 11, to 3—fewer plants than had operated in any year since 1893. Under the concentration plan, the largest plant in the area packed salmon for 9 firms. It was estimated that a saving of more than 525 cannery workers and tender operators was accomplished. In addition, there were considerable savings in the use of Diesel oil and the maintenance of cannery equipment.

The industry was continued under a similar concentration plan in 1945. However, four instead of three plants were authorized to operate, to provide for the somewhat heavier runs of salmon expected in the Puget Sound area that season.

PACIFIC PILCHARD INDUSTRY

The pilchard production program, which was directly concerned with a billion pounds of fish or nearly a quarter of the annual fishery production in the United States, differed considerably from the salmon concentration plan in its purposes and methods.

Unlike salmon, pilchards or Pacific sardines have several major uses, being processed into oil and meal in addition to being canned. Although each of these uses is important, the production of canned

fish was considered most essential, the demand for this easily transported protein food for war purposes being greatly in excess of the supply. The production program for the pilchard fishery was therefore administered with a view, not only to increasing production, and conserving manpower and materials, but also to diverting the largest possible proportion of the catch to the canneries.

The first order issued by the Office of the Coordinator of Fisheries for the control of the production of pilchards became effective in the 1943-44 season. Under this order, all vessels engaged in pilchard fishing operated under permits issued by the Coordinator of Fisheries through his local representatives. The order applied to all vessels of 20 net tons or over, which had fished for pilchards at any time subsequent to May 31, 1940.

Although operating under the control of the Coordinator's Office because of the emergency, the industry remained under the general provisions of the State laws with respect to seasons and fishing areas. The Coordinator of Fisheries and his designated representatives were concerned largely with the distribution of fishing vessels among ports, with the delivery of the catch to canneries and reduction plants, and with determining how much of the yield should be canned and how much should be processed as meal and oil. Normally, about a quarter of the catch is canned as the familiar Pacific sardine and the balance is processed into meal and oil.

Generally speaking, there was gratifying cooperation on the part of the fishing fleets and shore plants in operating under the program. There was a stable and for the most part a well proportioned distribution of boats between ports and deliveries to the plants within the ports were in proportion to the quantities each plant could process. There were few instances where boats were delayed in unloading and these occurred only when huge catches were made on a number of successive days, clogging port receiving facilities.

During the second season in which a production program was followed, many of the difficulties met in its original operation were solved. As a result of this circumstance and of the generally more favorable conditions (additional boats, good weather early in the season, steady runs of fish) production during the 1944-45 season increased 15 percent over the previous year, and the pack of canned sardines increased 19 percent.

The quantity of canned sardines requisitioned by the Government was increased from year to year with the mounting needs for this protein food, in high demand because it is so easily transportable. During the 1943-44 season, the Government set-aside orders amounted to approximately half of the total pack. The following season the reservation for Government purchase was increased successively from 45 percent at the beginning of the season to 55 percent in the

early months of fishing, and finally to 100 percent of the pack at the season's end. The Government requisition announced at the beginning of the 1945-46 season was 80 percent of the pack.

ALLOCATION OF HALIBUT

An order providing for the allocation among dealers of all halibut landed at United States ports on the Pacific coast became effective June 23, 1944. Under the terms of the order all persons or firms were prohibited from purchasing halibut without a permit issued by the Office of the Coordinator of Fisheries. The principal purposes of the order were to distribute halibut as efficiently as possible to meet war and essential civilian needs, to provide the various markets with essentially normal portions of the product, to support the price-control program of the O. P. A., and to facilitate the maximum production of halibut with minimum expenditure of critical materials and manpower.

In 1944 landings of halibut were allocated among dealers in each port on the basis of the total landings at that port handled by each dealer in a previous period, selected as a base. In 1945 the order was modified to provide for allocation to each dealer in accordance with his share, during the base years, of the halibut business of the entire coast, without regard to where the fish were landed. This amendment was intended to improve distribution, and to protect dealers from the effects of shifts of landings from port to port. The amended order also provided for the conditioning of permits to insure more normal distribution to inland markets.

PRODUCTION RECORDS DURING THE WAR PERIOD

The yield of fishery products suffered a drastic reduction during the first year of war. The normal peacetime yield of the fisheries is about 4.4 billion pounds. In 1942, however, the catch declined to 3.9 billion pounds under the stress of war-created difficulties of operation. By the end of 1943, the programs of the Coordinator's Office were beginning to exert their effect and the catch rose to 4.2 billion pounds. In 1944 it actually exceeded the peacetime average, a production of 4.5 billion pounds being achieved. During the first 6 months of 1945, still further gains were recorded in the fisheries as a whole.

Considered by classes of fishery products, the yield, in comparison with the need, was uneven. At no time was there enough canned fish to supply all civilian needs after essential war requirements had been met. Nor was there enough fish meal and oil for animal feeds, or oils for industrial purposes. The domestic vitamin oil industry developed by mighty strides, supplying the fish liver oils that formerly were obtained largely by import, but by 1945 it was apparent that additional domestic sources of oil would have to be discovered if the

United States industry was to prove capable of meeting the heavy demand for vitamin-A oils. Only in the fresh fish field was the supply commensurate with the need, and even fresh fish became scarce in 1945, owing to the extreme shortage of meat and consequent heavy demand for fish. It should be remembered, however, that the actual wartime needs for fish were far in excess of any previous production in the history of the industry; that the production achieved by the industry in the last 2 years of the war would have been considered excellent by any previous standards.

Probably no other nation in the world was able to maintain its wartime production of fish so well. It is a matter of record that most of the European fisheries were shattered, their fleets destroyed, their shore facilities wrecked, their accustomed fishing waters sown with mines. Most Asiatic fisheries were affected in similar fashion. The wartime difficulties suffered by the fisheries of the United States differed in character and in degree from those of most of the belligerents, but the impediments to operation, especially in the early years of war, were none the less real. The wartime achievements of the fishing industry are a record of distinguished service, and a testimony to what may be accomplished by cooperation in a common cause between Government and industry.

National Park Service

NEWTON B. DRURY, *Director*

THE increase of travel to the national park system areas after VE-day gave an intimation of postwar responsibilities that face the Service. This report, then, is not solely one of progress or accomplishment; it is also an analysis of the status quo in search of a workable plan to meet the immediate needs of millions of war-weary Americans, while serving their future needs by according the fullest degree of protection to the heritage embodied in the National Park System.

SERVICE HAS BEEN HOLDING THE LINE

This has all been recognized by Chairman Jed Johnson, of the Interior Department Subcommittee of the House of Representatives' Appropriations Committee. In discussing reductions in the 1946 estimates of funds for the national park system, he said: "America's entry into the war affected the National Park Service far more than any other agency within the entire Department * * *. The Service is to be commended for the spirit with which it has carried on under extremely adverse circumstances." The circumstances may be illustrated most effectively, perhaps, by the following tabulation comparing allotments provided and services rendered during the last prewar year (1941) with those of the war years:

	As of June 30—				
	1941	1942	1943	1944	1945
Employees.....	5, 145	4, 510	1, 974	1, 573	1, 577
Visitors.....	19, 306, 959	16, 034, 285	8, 228, 220	7, 460, 185	8, 546, 316
Appropriations.....	\$9, 370, 030	\$14, 609, 775	\$5, 347, 365	\$4, 563, 560	\$4, 740, 810

Examples of the difficulties of wartime operation are many. A few might here be given. In Glacier National Park, where the forest fire danger is high, there are 1,085 miles of fire-fighting and tourist trails which have to be opened not once, but several times yearly. Only by means of camps of conscientious objectors assigned by the War

Department was it possible to maintain these trails in usable condition. In Hawaii National Park, with extremely heavy visitation of armed forces personnel, the greatly reduced staff was inadequate even to maintain trails and comfort stations or provide police and fire protection.

In September, the most severe hurricane in 40 years whipped the Atlantic coast, seriously damaging several Service areas. At Fort Raleigh National Historic Site, as an example, between 70 and 80 trees were blown down and the palisade fence surrounding 16 acres was flattened. Only through \$1,195 of emergency reconstruction and fighting forest fires funds was it possible to accomplish such repairs as could be made. At Petrified Forest National Monument, 120 men in maintenance made it necessary to utilize protective personnel badly needed to prevent vandalism and theft of petrified wood and emergency maintenance of the power plant, water system, and other facilities. These situations are typical of the entire national park system, but the ingenuity and cooperation of our employees enable us to keep the numerous units of the System in operation and open to visitors, many of them in the service of the United Nations.

Passage of the peak in the program of organizing the Nation's resources for war and the progress of the war toward its victorious close resulted in a sharp decline in applications for military and other wartime uses of Service-administered areas during the past year. Only 455 new special use permits were granted, 228 previously issued permits were continued, and 602 were terminated. In all, 2,396 new use permits have been issued for national park areas.

Although the work of the National Park Service was not considered to be tied in directly with the prosecution of the war, the areas administered provided much-sought recreational opportunities for members of the armed forces and those engaged in war industry and it is also fair to say that the system through war permits made an appropriate contribution to the victory. The use of park lands for military purposes made unnecessary the purchase of other lands and that there was an estimated saving of approximately \$30,000,000 from the funds of the Army, the Navy, and other war agencies that otherwise would have been expended for land. Yet there was little destruction of park properties through these emergency uses. Under the war permits, as a matter of critical war necessity, tungsten was obtained from an isolated section of Yosemite National Park, in accordance with the previously announced attitude toward such purposes. The national parks, it is believed, are not the places in which to experiment with new developments in transportation. Aside from the fact that safe locations for landing strips are few in the national western parks, it is doubtful if such facilities within the parks would provide material advantages over those which might be established elsewhere.

short distances beyond their borders. Railheads are generally outside the parks. The same should be true of airports.

Two pending legislative proposals, in addition to those directed at Jackson Hole National Monument and the Antiquities Act, would or could affect certain Service-administered areas adversely. The bills providing for the establishment of a Missouri Valley Authority (S. 555 and H. R. 2203) contain no provision exempting Yellowstone, Glacier and other units of the national park system situated in the Missouri Basin from the construction of water-control structures within them or that would impound waters inside their boundaries. A threat to the historical atmosphere and the Colonial character of Colonial National Historical Park is found in the Bland bill (H. R. 26) which would authorize the construction of a lofty suspension bridge across the York River at Yorktown, of which the elevated southern approach would be constructed on park lands. The Secretary of the Interior and the Service have endeavored to meet this threat by pointing out the advantages of other locations for the proposed bridge.

Those who appreciate the charm of the old Chesapeake & Ohio Canal, now a part of the National Capital Park system, and the scenic values of the Potomac Valley, including the Great Falls, a short distance above Washington, were heartened by the strong protests registered against the Corps of Engineers' proposal to construct a series of flood-control power dams along the course of the Potomac, and the consequent decision against this proposal.

TRAVEL TO NATIONAL PARK AREAS INCREASING

The fact that, despite tightened rationing of gasoline and a Nation-wide campaign to reduce civilian use of common carriers to make room for war transport, the number of visitors to units of the national park system increased from 7,460,185 during the year ending June 30, 1944, to 8,546,316 for the year ending June 30, 1945, indicates the pressure for services and accommodations under which the greatly reduced staffs of the National Park Service and of the concessionaires had to operate. Many of the visitors were war industry workers and their families moving to other jobs, and uniformed personnel of the armed forces traveling between stations or coming in groups to the parks and monuments for rest, recreation, or recuperation.

Throughout the year, the policy of refraining from all activities which would tend to promote travel was continued. No effort will be devoted to that end in the near future. It need not be. After the war many areas in the System will have many more visitors than can be accommodated satisfactorily with existing facilities. Effort needs to be directed rather toward effecting a more even distribution of travel, so that peaks may be at least partly leveled off, and more

visitors may derive greater enjoyment from their visits than can be obtained during the crowded periods.

A statistical tabulation of areas and the volume of travel to each appears on pages 228 to 231 inclusive.

CONCESSIONAIRES FACE WARTIME DIFFICULTIES

Concessionaires continued to operate on a limited scale throughout the year. In areas near war activity centers they encountered great difficulty in meeting demands because of manpower and food supply shortages. As required by their contracts, concessionaires furnished limited services such as stores, meal and sleeping accommodations, and other requirements, in areas where distinct need was manifest. All OPA rules and regulations with respect to ceilings and food and gasoline rationing were applied in national parks as elsewhere. The Service worked with the concessionaires in meeting problems caused by drastic fluctuations in the volume of service. In two specific cases, with approval of the Comptroller General, concessionaires were authorized to terminate or temporarily suspend services called for by their contracts.

The Western Conference of National Park Concessionaires met in Los Angeles on April 24-25, with the Director and a few officials of the Service in attendance, for discussion of such subjects as employee wages and hours, sale of souvenirs, public health, postwar travel trends, and postwar planning of accommodations.

National Park Concessions, Inc., a nonprofit distributing corporation, continued to furnish facilities at Mammoth Cave, Isle Royale, and Olympic National Parks. It did not operate on the Blue Ridge Parkway nor in Vanderbilt Mansion National Historic Site because of war conditions, but will start operations at these places and in Big Bend National Park whenever postwar relaxations permit the construction of needed accommodations.

LIMITED ADVANCE PLANNING ACCOMPLISHED

The "closed for-the-duration" status of development and construction continued, and planning activities have dealt primarily with preparation for transition from wartime restrictions to normal postwar activities. This standstill in development provided an opportunity to appraise past efforts and to make definite plans for the future. Studies were undertaken to establish a basis for future policies regarding all-year use at areas such as Crater Lake, Mount Rainier, and others where developments cannot be planned until a definite use policy is established.

Special Problems

Consideration was given to the type, extent, and location, or relocation, of concession operations at Sequoia-Kings Canyon, Yosemite, Big Bend, Isle Royale, and Olympic National Parks. The location and extent of headquarters developments at Great Smoky Mountains, Antietam, Petersburg, and Gettysburg were also studied.

Advance Planning

Although master plan work was in general limited to minor revisions, preliminary plans were made ready for Big Bend, Grand Teton, and the Jamestown Island section of Colonial National Historical Park. A new master plan was prepared for Carlsbad Caverns National Park and the first complete plan for Natchez Trace Parkway was submitted. Although lack of funds prevented planning of specific postwar development projects, a number of steps were taken in preparation for this program. Two postwar project programs were tabulated, with expense and time estimates, as part of the over-all Department of the Interior program. In an effort to establish a priority on future work for survey or construction, priority lists of important road, trail, physical improvement and parkway projects were prepared.

Late in the year, a landscape architect was established at Juneau, Alaska, to begin the basic field study and planning which must precede any developments on the five units of the National Park system in Alaska. Architects assigned to the Blue Ridge and Natchez Trace Parkway offices collaborated with the Public Roads Administration in the production of contract plans for bridges and grade separation structures.

PROTECTION CONTINUED UNDER HANDICAPS

Fire Prevention and Suppression

As the virgin forests of the Nation are cut or otherwise modified by commercial uses, the remnants preserved within the National Park system increase in importance to the Nation. Fire is always the great threat to those forests. Despite shortages of manpower and equipment, it is reported with considerable satisfaction that only 276 forest fires occurred in areas of the National Park system during the calendar year 1944, the smallest number during any year of the past decade. A total of 4,928 acres was burned over, of which 973 acres were forest, 607 acres brush, and 3,349 acres grassland. Intensive fire control training activities were continued by means of regional conferences. Deterioration of specialized and mechanized control equipment, impossible to replace during the war, and the necessity of using inex-

perienced youths and older men in fire control added to the normal problems of this protective work.

Combating Forest Insect Pests

Because of wartime relaxation of insect control measures, widespread epidemics developed in certain sections of the West and directly affected some of the park areas. It has been possible to handle incipient epidemics in some areas, but serious losses are faced in other sections because of inadequate funds to attempt complete control. Among forest insects combated were the spruce budworm in Rocky Mountain, bark beetles at Scotts Bluff and Bryce Canyon, Engelmann spruce beetle at Cedar Breaks, and saw flies, "loopers," leaf miners, and tent caterpillars at Zion.

Combating Tree Diseases

White pine blister rust continued to spread southward both in the East and in the West. Control work consisting of destruction of the alternate host (currant and gooseberry bushes) during calendar year 1944 included eradication on 1,603 acres and re-eradication on 8,533 acres, the maximum possible under manpower shortages. It is imperative that initial control be intensified, particularly in California, if the magnificent sugar pines of Yosemite and Sequoia-Kings Canyon are to be protected before the disease reaches those areas. The beech bark disease has invaded Acadia National Park but is being fought successfully by sprays which control scale insects whose attack precedes infection. Continuing control is essential.

Studies on the cactus necrosis, which became epidemic in Saguaro National Monument, indicate that the disease is fatal to old, mature plants, that its progress can be slowed by treatment, but that the principal threat to the continuation of the cactus forest is the lack of reproduction, due to overgrazing.

Soil and Moisture Conservation

Accelerated erosion on arid lands, often aggravated by overgrazing, has been controlled to some extent by measures financed through Departmental Soil and Moisture funds. Major prehistoric ruins in Canyon de Chelly and Chaco Canyon National Monuments have been saved from destruction by diverting or dispersing flood waters which have cut channels threatening to undermine these ancient pueblos. Nine units of the system benefited by soil and moisture work, including the new Big Bend National Park.

Impact of Visitor Use

Human use, which beyond a certain point inevitably results in wear and tear, during the war relaxed to some extent with the marked

reduction in travel. Studies were made at Zion National Park in an effort to determine harmful effects of past use and provide future controls. Carelessness and vandalism continued, especially at the Petrified Forest and in the various limestone caverns, where the temptation to take souvenirs seems well nigh irresistible to some. At Carlsbad Caverns National Park, an experiment in prevention of vandalism through education was tried with some success on the theory that when people understand the vast length of time and the intricate processes required by nature to create irreplaceable formations they will think twice before wilfully destroying them.

Protection of Prehistoric Ruins

Throughout the Southwest prehistoric Indian ruins are subject to the destructive effects of weather and, to some extent, rodents and livestock. During wartime, almost no funds were appropriated for protective work, and accelerated deterioration resulted. Unless a determined and well-financed effort is made to preserve what remains, the life of many of these structures is definitely limited.

Grazing Eliminated in Big Bend

Although transportation and manpower difficulties impeded the removal of stock from lands within Big Bend National Park and in a few cases extensions were provided, over 90 percent of all stock had been removed at the year's end. In some portions of the area, improvement in vegetation is already noticeable.

WILDLIFE MANAGEMENT

The majority of wildlife problems in national parks and monuments arise from factors over which the National Park Service has little or no control, either because areas are too small or because their boundaries are such that they provide incomplete biotic units. They are therefore affected materially by such outside influences as predator eradication, competition with domestic livestock for food during winter periods when game and other animals migrate beyond the boundaries, and hunting; these, in turn, result in the building up of surpluses of certain species, and overconcentrations in certain locations. The end result is adverse effect upon both wildlife and vegetation, including the forests.

Such situations make it difficult to develop management programs that will assure reasonably stable wildlife populations. They require constant study and the development of management practices based upon it. Overpopulations of game animals in several parks have stimulated group pressure to open them to public hunting as a means of harvesting the surplus. Aside from the fact that it is prohibited

by law, the National Park Service is convinced that any authorization of hunting would establish a dangerous precedent, as well as have other detrimental effects. Where control has been necessary, the Service has continued to exercise it. Reductions were carried out at Rocky Mountain National Park, where 301 elk and 113 deer were removed, and at Zion National Park where 112 deer were killed. Normal hunting outside of the boundaries of Yellowstone National Park kept the elk herd there at a safe level, so that no reduction was necessary.

The past year saw progress in the Service's program of eliminating feeding and other artificial controls over the bison of Yellowstone and reestablishing these animals in their native state—a program based on the long-established policy of displaying the wildlife of national parks under conditions as nearly natural as possible. Careful attention will continue to be given to the herd so that any detrimental developments or influences may be recognized and steps taken promptly to correct them.

The ban on the feeding of garbage to the bears of Yellowstone and Yosemite has been maintained, and though there has been some criticism of it by those who consider "bear shows" in national parks an attraction to many visitors, the Service feels that it is entitled to ample time to test the practicability of the revised practices as an improvement for both the visitors and the bears. No doubt the "shows" have been an attraction to many. However, they have produced wholly unnatural concentrations of both black bears and grizzlies, have tended to make them dependent on man and unwilling to shift for themselves, and have displayed these animals under artificial conditions. The principal problem still faced by the Service in connection with these animals is the insistence of some visitors on giving them "handouts," a dangerous practice the prohibition of which is difficult to enforce.

Because of the continuing problem of bighorn sheep-wolf relationships at Mount McKinley, arrangements have been made with the Fish and Wildlife Service for a study to determine what action, if any, is required. Observations at Joshua Tree National Monument indicate that both deer and desert bighorn sheep increased there during the year. The reestablishment of wild turkeys at Mesa Verde National Park appears to have been successful. The use of park waters by fishermen brought up numerous questions of fish management, but the establishment of effective controls are dependent on securing factual data. The Fish and Wildlife Service completed studies in Big Bend National Park as a basis for setting up fishing rules and regulations there. In Glacier National Park, a Fish and Wildlife Service aquatic biologist carried on extensive stream survey work leading to obtaining evidence as to migration and reproduction

habits. The study is designed also to provide an evaluation and comparison of various stocking practices. Fish management studies were also initiated in a few parks by National Park Service personnel.

COOPERATIVE RESPONSIBILITIES GROW

Completion of the Alaska Highway Study, undertaken with funds supplied by the Army, was followed by a request from the Corps of Engineers, under section 4 of the 1944 Flood Control Act, for an appraisal of the recreational resources of 68 reservoir sites under consideration by the War Department, and these studies are being undertaken. Cooperation with the Bureau of Reclamation in studies of reservoir basins which they plan to develop or have developed continued in increased volume. This involves a series relating to Missouri Valley reservoir projects likely to extend over several years. The Service also conducted investigations of the recreational potentialities of 100 sites under consideration on seven river basins in Texas, Oklahoma, and portions of Kansas, Colorado, and New Mexico. Planning studies continued, in cooperation with the Bureau, on the Columbia Basin project, while the survey of the recreational resources of the Colorado River Basin, under way for several years, made material progress.

Administration of the recreational activities at Shasta Dam and Friant Dam in California, in addition to planning and development, comparable to that which the Service has furnished for some years at Boulder Dam, was provided for in an agreement with the Bureau of Reclamation, and a start was made on the establishment of the needed planning and administrative organization. A similar responsibility has been placed on the Service with reference to Lake Texoma, in Texas and Oklahoma. Though the acquisition of additional lands to insure proper development was recommended, no steps have been taken in this direction.

HISTORIC SITES ACT TEN YEARS OLD

During the 10 years since President Roosevelt approved the Historic Sites Act, 560 historic sites have been inventoried and 334 archeological sites have been cataloged. Sixteen of the sites recommended by the Advisory Board on National Parks, Historic Sites, Buildings and Monuments have been approved by the Secretary and created national historic sites. Each of these fills an important place in the Federal program of presenting a well-balanced pageant of American history. The studies have accumulated a large body of basic data useful to the Secretary and to Congress in considering establishment of new areas and in formulating policies for preservation and restoration. They emphasize the richness of the Nation's historical and archeological

resources. It is hoped that the historic sites survey, now a little more than half finished, can be completed in the early postwar period.

The first meeting of the entire Advisory Board on National Parks, Historic Sites, Buildings and Monuments since May 1942, was held in Chicago on December 7-9, 1944. On March 8-9, 1945, a meeting of the interim committee of the Board was held in Washington, D. C. Tom Wallace of the Louisville Times was appointed to fill the vacancy on the Board created by the death of Richard Lieber. On June 14, 1945, the Board suffered the loss by death of its chairman, Edmund H. Abrahams, who had served on the Board since its inception and whose wide knowledge of national park problems had been a great aid to the Service. To aid in the investigation, selection, treatment, and interpretation of historical and archeological areas, the American Council of Learned Societies defrayed the expenses of a conference in Morristown, N. J., June 7-8, 1945.

Successful prosecution of the war was reflected by increased public interest in certain types of historical reservations, particularly memorials, associated in the public mind with the ideals of liberty and democracy for which this Nation stands. The Statue of Liberty National Monument, which participated with its lights in the VE-day observance, was the scene of a great Fifth War Loan drive rally on June 2, 1945. An illustration of the colossal stone portraits of former presidents constituting the Mount Rushmore National Memorial was widely distributed as a Seventh War Loan drive poster.

The huge cyclorama, a painting 400 feet long by 50 feet high, portraying Pickett's charge in the Battle of Gettysburg and located in Gettysburg, Pa., was designated a national historic object by the Secretary on October 5, 1944. Painted by Paul Philippoteaux in 1882 at a cost of \$100,000, it is considered an accurate portrayal of Pickett's action. Among other important historical acquisitions during the year was the Historic Boundary Oak, perhaps the only living object on Abraham Lincoln National Historical Park dating back to the time of Lincoln's birth.

VARIETY OF LAND PROBLEMS FACE SERVICE

Non-Federal Lands in Service Areas

During 1945, as in the past, many problems of development planning, protection, and administration defied solution because of lack of land control. Within the boundaries of units of the National Park System there are more than 600,000 acres of non-Federal land. During the year considerable progress was made in obtaining detailed information as to the location, importance, and physical characteristics of these lands. One of the greatest needs of the National Park System is an

orderly program of land acquisition, based on reasonable recurring appropriations, and directed toward the ultimate elimination of non-Federal land ownership within authorized boundaries of all park areas. Until such a program can be established, scenic values will continue to be lost, undesirable developments and uses will persist, and difficulties in planning and providing for needed developments will continue to plague the Service.

The serious situation existing in Joshua Tree National Monument, where thousands of acres of railroad lands checkerboard a large part of the area, well illustrates this problem. The possibility of a promotional land-selling project threatens the future of this monument.

In Glacier National Park, the Izaak Walton League of America, Inc., made an emergency purchase of 10 lots near Lake McDonald to be held until such time as the Service is able to buy them from the league. The league set up a land purchase revolving fund to be used in similar emergencies to buy non-Federal lands.

As a basis for rounding out ownership or eliminating lands whose retention is not justified, the Service has made a small beginning on the review of boundaries of each area under its administration. Studies were made of boundary problems at Zion National Park and Monument, Grand Canyon National Park and Monument, and Wupatki National Monument. Similar studies were made for the Bureau of Reclamation at Boulder Dam National Recreational Area.

New Areas and Additions to Existing Areas

Actual land changes in the National Park system were few. Investigations of proposed new areas ceased during the war, and acquisitions were confined to acceptance of donations under authority of Congress or to minor boundary rectifications. At the close of the fiscal year, the system contained 168 units, one new unit having been established and two eliminated since June 30, 1944.

After some 8 years of endeavor, the Richmond National Battlefield Park, Va., notable as the scene of several bitter battles during the Union drives on the Confederate Capitol, was established on July 14, 1944, when the Department accepted title to 688.44 acres from the Virginia Conservation Commission. Added to Shiloh National Military Park, Tenn., was a small but important tract of 0.93 acre donated by Mr. and Mrs. W. A. Shaw, and accepted by the Secretary on March 12, 1945. All titles having been cleared, the 80-acre Adams estate was added to Lava Beds National Monument, Calif., through acceptance of deeds by the Secretary in November 1944. On July 28, 1944, the Secretary accepted approximately 32 acres of land in Hot Springs National Park, on which the United States Public Health Service operates a Medical Center. Thurston Lava Tube lands totaling 20.6 acres in Hawaii National Park were accepted by the

Department on April 11, 1945. At Mount Rainier National Park, a contract to purchase 304.84 acres of Northern Pacific Railway timberlands, adjacent to the Nisqually entrance road, which the Service has been attempting to obtain for 19 years, was approved.

Reductions

Custody of the Chattanooga National Cemetery, Tenn., was transferred back to the War Department on March 1, 1945. Camp Blount Tablets National Memorial, Tenn., although listed under the 1933 Presidential Reorganization Order, was found to have no legal status as Federal property.

Projects and Prospects

Because of oil exploration activity on the North Carolina "Banks," North Carolina State authorities have had to delay the acquisition of lands essential to the Cape Hatteras National Seashore Recreational Area project, authorized by act of Congress August 17, 1937. Progress on the 10,000-acre Cumberland Gap National Historical Park project, with lands in Kentucky, Tennessee, and Virginia, has been encouraging. Four thousand acres of the 5,100 in Kentucky have been acquired by the State, and Tennessee has completed surveys on approximately 2,600 acres for proposed acquisition.

By congressional act approved December 6, 1944, provision was made for acceptance by the Federal Government of lands and waters within the Everglades National Park project, Florida, for wildlife protection only, pending establishment of the authorized national park. Title papers relating to the first conveyance by the State of Florida of more than one million acres of the project are in the hands of the Fish and Wildlife Service, which will protect the extraordinary bird life and other biological features of the area.

The Fort Frederica National Monument Association, Georgia, had acquired nearly all of the land involved in this project by the end of June. The entire area has since been accepted and the monument established.

The Grandfather Mountain Association, a non-Federal body in North Carolina established for the purpose of acquiring lands for this proposed addition to the Blue Ridge Parkway, has obtained price quotations and tentative agreements from the landowners. Congress having authorized the establishment of a national monument of not more than 1,500 acres at Harpers Ferry, W. Va., the prospective area was carefully studied and recommendations as to the lands to be included were presented to the Secretary.

The State of Iowa has acquired approximately 1,000 acres necessary for the Iowa Indian Effigy National Monument project. Conveyance of the land to the Federal Government and establishment of the na-

tional monument is anticipated in the near future. Efforts continued to complete the land and development programs of the Manuelito National Monument project in Arizona and New Mexico. The Queets Corridor and Ocean Strip, Olympic National Park, a Public Works project embracing the scenic and picturesque coastal area of northwestern Washington, remained in the acquisition stage.

By his first action in direct connection with a project of the National Park System, President Truman approved the Touro Synagogue National Historic Site project, Rhode Island, on April 19, 1945.

To be administered by the Service as a national historic site, the Adams Mansion project, Quincy, Mass., was near fulfillment at the year's end. This house, the home of generations of this famous family, possesses exceptional historic value.

Legislation authorizing the establishment of Patrick Henry National Monument at Red Hill in Virginia was repealed by act of December 21, 1944. The State of Virginia has undertaken a similar project.

Water Rights in the Western States

The Service has completed 10 years of concentrated effort to establish rights to use water in its various areas, started in February 1935 with Civilian Conservation Corps funds, and is now in an excellent position to keep the work abreast of new construction and water use when the public resumes peacetime recreational travel.

Recreational Demonstration Area Transfers

Fall Creek Falls and Shelby Forest recreational demonstration areas, totaling 28,035 acres, were transferred to Tennessee for State park purposes, in accordance with the terms of the act of June 6, 1942, and 1,072 acres of the Otter Creek area in Kentucky went to the War Department as an addition to Fort Knox. The transfer of the 66,376-acre Roosevelt area in North Dakota to the Fish and Wildlife Service for establishment as an upland game refuge has been approved by the President but had not been completed at the year's end. Fourteen additional areas, totaling 81,251 acres, in California, Georgia, Kentucky, Missouri, Oregon, Pennsylvania, and Virginia are available for transfer to the States.

EMPLOYMENT CRISIS ENDED

Some handicaps continued in the basic fields of administration, protection, and maintenance as a result of the wartime curtailment of staff and the necessity of leaving positions vacant or filling them with inexperienced personnel. That the major duties of the Service were discharged creditably is a tribute to the loyalty, determination, and hard work of employees, new and old.

Department on April 11, 1945. At Mount Rainier National Park, a contract to purchase 304.84 acres of Northern Pacific Railway timberlands, adjacent to the Nisqually entrance road, which the Service has been attempting to obtain for 19 years, was approved.

Legislation authorizing the establishment of Patrick Henry National Monument at Red Hill in Virginia was repealed by act of December 21, 1944. The State of Virginia has undertaken a similar project.

Water Rights in the Western States

The Service has completed 10 years of concentrated effort to establish rights to use water in its various areas, started in February 1935 with Civilian Conservation Corps funds, and is now in an excellent position to keep the work abreast of new construction and water use when the public resumes peacetime recreational travel.

Recreational Demonstration Area Transfers

Fall Creek Falls and Shelby Forest recreational demonstration areas, totaling 28,035 acres, were transferred to Tennessee for State park purposes, in accordance with the terms of the act of June 6, 1942, and 1,072 acres of the Otter Creek area in Kentucky went to the War Department as an addition to Fort Knox. The transfer of the 66,376-acre Roosevelt area in North Dakota to the Fish and Wildlife Service for establishment as an upland game refuge has been approved by the President but had not been completed at the year's end. Fourteen additional areas, totaling 81,251 acres, in California, Georgia, Kentucky, Missouri, Oregon, Pennsylvania, and Virginia are available for transfer to the States.

EMPLOYMENT CRISIS ENDED

Some handicaps continued in the basic fields of administration, protection, and maintenance as a result of the wartime curtailment of staff and the necessity of leaving positions vacant or filling them with inexperienced personnel. That the major duties of the Service were discharged creditably is a tribute to the loyalty, determination, and hard work of employees, new and old.

The rate of losses to the armed services diminished during the year, mainly because few physically fit men of military age remained. However, in accordance with the announced policy of the Selective Service System not to induct men beyond an age desirable for military service who are engaged in essential occupations, a few deferments were requested and approved.

While vacancies during the year averaged approximately 10 percent of permanent positions, the crisis in employment has passed. By June 30, 1945, 33 veterans had returned to their former positions in the organization. This number is small compared to the total number of employees on military furlough, but it is indicative of the trend. More and more veterans are becoming available for original appointment.

Many men now in the armed forces have expressed interest in the National Park Service as a postwar career. Some of this interest has been aroused as the result of visits to units of the system as part of a military training program, en route between assignments, or attendance at a rest camp. Names of these inquirers have been recorded so that they may receive announcements of suitable examinations, and they have all been encouraged to renew their applications immediately upon discharge.

Service requirements offer a great variety of opportunities for the employment of special talents and interests in the field of conservation. The maintenance of high standards of performance rests upon placing each employee in the position for which his interests and ability best qualify him. To determine and record these interests and qualifications and at the same time to train new employees in the details and requirements of the positions which they will fill on entering the Service necessitates the establishment of a program of in-service training. For many years the Branch of Forestry has maintained such a project in training new and old employees in the latest fire-fighting practices and use of equipment. Several colleges and universities have expressed interest in establishing courses leading toward preparation of students for careers in national park administration, an interest which the Service has encouraged through suggestions for use in setting up a curriculum.

Important Personnel Actions

Charles L. Gable, Supervisor of Concessions, retired because of disability, and Oliver G. Taylor, formerly Chief of Engineering, was placed in this position. Arthur W. Burney, Assistant Chief of Engineering, was advanced to Chief of Engineering.

The vacancy in the position of Superintendent of Acadia National Park, Maine, resulting from the death of George B. Dorr, was filled by the advancement of Assistant Superintendent Benjamin L. Hadley.

Blair Ross was advanced from superintendent, Shiloh National Military Park, to fill the position of superintendent of Great Smoky Mountains National Park vacated by the retirement of Ross Eakin because of illness and disability. James W. Holland, custodian of Andrew Johnson National Monument, was placed in charge at Shiloh. Chief Ranger Wallace Stephens of Shenandoah National Park was advanced to the custodianship of Andrew Johnson National Monument. Dr. A. R. Kelly, custodian at Salem Maritime National Historic Site, and William W. Lockett, custodian at Ocmulgee National Monument, exchanged positions.

Col. David C. Chapman, former chairman, Tennessee Great Smoky Mountains National Park Commission, who took an important part in the establishment of the park, died on July 26, 1944.

LEGISLATION AFFECTING ANTIQUITIES ACT

Five bills designed to modify or abolish the Antiquities Act of June 8, 1906, are pending in the Seventy-ninth Congress. House bill 409, introduced by Representative Fernandez, would amend section 2 of the act to require congressional concurrence in the establishment of national monuments of more than 10,000 acres; House bill 1507 was introduced by Representative Chenoweth and House bill 2110 by Representative Barrett to repeal section 2 of the act and thus take away the President's authority to proclaim national monuments on Federal lands; Senator Robertson's Senate bill 664 would require approval by the governors and a majority of the congressional delegations of the States effected before the issuance of national monument proclamations pursuant to the act; House bill 1112 was introduced by the late Representative O'Connor to repeal the Antiquities Act. Reports were prepared on all of these bills, but congressional action has not been taken on any of them.

JACKSON HOLE NATIONAL MONUMENT

The past year was marked by two important events in the controversy over the establishment of Jackson Hole National Monument on March 15, 1943. Last February, the validity of the monument's establishment was upheld in Federal District Court in the suit, *State of Wyoming v. Paul R. Franke*. A bill to abolish the monument (H. R. 2241), introduced by Mr. Barrett of Wyoming, was passed by both houses of Congress, but was vetoed by President Roosevelt who, on December 29, 1944, issued a memorandum outlining the reasons for his conviction that status as a national monument provides for use of this land in a manner best serving the national interest.

In the Seventy-ninth Congress, Representative Barrett has introduced House bill 2109 to abolish Jackson Hole National Monument and House bill 2691 to transfer the public lands in the monument to

the United States Forest Service for administration as national forest lands. Senate bill 664, by Senator Robertson of Wyoming, amending the Antiquities Act, is so framed that, if it became a law, the monument would be abolished. Representative Peterson of Florida has introduced House bill 1292, which provides for payments in lieu of taxes to the county where the monument is located, and for the continuance of grazing and other permits within the monument, in accordance with assurances already given by the Secretary of the Interior.

No funds were provided by the Congress for administration of the Jackson Hole area as a monument, but limited protection activities were authorized. Permits for grazing on public lands within the area, based on use during 1942, were authorized as a departmental measure. During the controversy, considerable space was devoted by the press to its discussion, much of it based on misunderstanding or misinformation. During the past year, however, and particularly after President Roosevelt issued his veto message, there has been increasing editorial comment strongly supporting his action. As an example, the editor of the Blackfoot, Idaho, Bulletin suggested that other editors and officials of interested organizations reexamine the evidence which, in the light of careful study, has caused him to withdraw his opposition and favor establishment and development of the monument. During the controversy, the national monument has received strong support from numerous conservation organizations.

INFORMATIONAL AND INTERPRETIVE SERVICES

Guide and Lecture Service

Naturalist and historian staffs remained at an absolute wartime minimum throughout the year; in fact the demand for interpretive services by visiting personnel of the armed forces together with the requirements of protecting collections and perishable park features, serving as consultants on technical problems, and maintaining libraries, exhibits, and other interpretive facilities kept the greatly depleted interpretive staffs and many of the custodians of smaller areas under excessive pressure. However, special efforts were made to afford guide and lecture service to members of the armed forces in the several areas where military visitors were especially numerous.

At Carlsbad Caverns National Park, the interpretive program was expanded by the development of a self-guiding nature trail and the establishment of a naturalist-conducted caverns trip. In addition, the procedure of handling visitors on trips through the caverns was radically revised, providing for the conduct of smaller groups and reducing the long waits which many visitors previously had to undergo.

Museums

While all museums in the system remained open insofar as reduced visitation and operating staffs permitted, no expansion of exhibits or other interpretive devices and activities was undertaken. Some planning was undertaken in the listing of urgently needed museum developments and the setting up of priorities for these developments on the project construction program.

Investigations

Accurate interpretation, adequate protection of natural values, and wise administrative practices require a considerable volume of research and investigation. Although many research projects with definite objectives can be and have been accomplished through the cooperation of other specialized Federal agencies, universities, scientific institutions, and research organizations, there remain projects necessitating continued observations over long periods of time or having other special requirements which only members of the resident park interpretive staff are in a position to accomplish. Recognition of this fact and the need for this type of research justifies postwar expansion of qualified interpretive staffs with adequate laboratory space and equipment.

Publications

Two publications issued by the National Park Service were particularly timely because of the greatly increased public interest aroused by the war in historical matters dealing with the establishment of this Nation as a land of universal liberty and justice. These publications are entitled, "The Oldest Legislative Assembly in America and Its First State House," and "'James Towne' in the Words of Contemporaries." "The Wolves of Mount McKinley," by Adolph Murie, of the Fish and Wildlife Service, recorded a noteworthy study of animal relationships.

Informational Services

With the approach of the climax in the prosecution of the war, increasing interest in the National Park system was indicated by a growing volume of inquiries regarding the areas under our jurisdiction and the purposes, policies, and administrative practices of the Service. School children sought information on historical areas because the issues involved in the war stimulated their interest in and appreciation of the accomplishments of the men who founded our Nation. A growing restlessness and desire to throw off the fetters of wartime travel restrictions made itself felt through a flood of inquiries from persons planning postwar vacations. Many such requests for information on units of the system came from men in the armed forces

whose realization of what these areas hold had been developed by visits to some of the units while in training or while transferring from one assignment to another. Editors, writers, and publishers, anticipating the timeliness of travel articles and books, requested detailed data, photographs, including color transparencies, and checking services in the preparation of numerous manuscripts. Automobile clubs and travel promotion organizations desired quantities of informational literature, not only as a source of information for their files but to distribute in response to the anticipated heavy demand. Departments of foreign governments embarking upon park and conservation ventures and made aware of the National Park System of the United States through contacts established in wartime enterprises, asked for assistance, counsel and details relative to selection and administration of units of the system. Although greatly handicapped by a reduced staff, the Service was able to furnish much of the information desired.

Informational Literature

As a means of aiding the small staff in answering requests for information quickly and inexpensively, a series of location maps, each one showing and describing briefly all units of the system in the area covered, was issued. A few of the informational circulars carrying condensed information essential to intelligent use of the areas were revised, and a limited number of new circulars prepared for unsupplied areas having wartime visitation.

There is need of much more extensive distribution of informational material to public libraries, schools, and newspapers and other publications, so that those who want facts or who wish to present facts can obtain them readily.

THE SERVICE LOOKS TOWARD THE FUTURE

To the question, "What does the National Park Service intend to do now that the war is over?", the answer must be, "We hope to do what we were doing before the war, but to do it better." This presupposes greater capacity, attained partly through wartime experience but principally through augmented funds and personnel. It presupposes also continued, if not increased, public recognition of the importance of the work.

The first problem to be met is that of getting the machinery of full operation into running order, involving a comprehensive program of rehabilitation for the roads, structures, and facilities which have suffered from lack of adequate maintenance during a crisis in which the prosecution of the war took precedence over all other activities. The barest minimum was asked for by the Service to continue essential activities. The field and central office staffs need to be restored

to peacetime size as rapidly as possible. Unless enlarged appropriations for the present fiscal year are obtained and rapid rehabilitation is effected, the coming heavy increase in travel will introduce or accentuate serious problems of providing service to visitors and protection to the parks.

It is estimated that an expenditure of approximately \$1,200,000 during the next 3 years will be needed to put the park areas into condition for postwar use. A program of such work has been formulated with great care and can be launched at full scale as soon as funds are made available.

Augmented field employment is required to perform the normal services which the public has a right to expect when it visits areas administered by the Service. Protective and administrative forces must be strengthened. Since the visitors desire both to see and to be informed about what they see, it is especially necessary that adequate staffs of naturalists or historians be placed on duty before the upsurge of 1946 vacation travel, so that there may be sufficient preparation for the conduct of their work.

Development

Solutions to certain present and anticipated problems depend not only upon sufficient personnel and funds, but upon adequate physical developments, upon which progress has been at a standstill for nearly 5 years. Over-all development, provided for in master plans which were prepared before the war, and which have been kept reasonably up to date during the intervening years, calls for a great variety of undertakings. It must include certain roads and trails, limited, in accordance with Service and departmental policy, in number and extent to those required to meet legitimate public and administrative needs. It involves public service facilities affording transportation, food, and lodging; essential administrative, protective, and maintenance structures such as offices, shops, museums, storage structures, fire detection towers, employee residences and fences, all carefully designed, located, and landscaped for effective use with a minimum of intrusion into either natural or historic scenes. Good planning for these types of development takes time and thought and it must precede development if irreparable mistakes are to be averted. It cannot be done in a hurry. It is also contingent upon control of land—which points to the necessity of an orderly program for acquisition of private and other non-Federal lands now situated inside the boundaries of Service-administered areas.

Implications of Enlarged Responsibilities

The responsibilities of the National Park Service are increasing both in volume and in diversity. The transfer of national military

areas and a number of national monuments to National Park Service administration in 1933; and the passage of the Historic Sites Act in 1936, with the resultant establishment of a group of national historic sites greatly enlarged the scope of the Service beyond what it was when established in 1916; the Park, Parkway and Recreational Area Study Act of 1936; the conduct of cooperative recreational studies for the Bureau of Reclamation and the Corps of Engineers; and, within the past year, the placing on the Service of responsibility for the administration of recreational facilities at Lake Texoma, in Texas and Oklahoma, and at Shasta and Friant Dams in California, have all meant expanded activities and more complicated organization.

The National Park Service is performing these new functions to the best of its ability. Yet there remains a primary responsibility for the integrity of the National Park System, and the Service is determined that no spreading of effort shall detract from the performance of its original duties. The National Park System is an entity which has distinct meaning to millions of Americans. It is important that its identity be maintained; that the basic distinctions in purpose and policy between the system and those other areas which are not a part of it be clearly established and made plain to the public. The work of the Service is being organized with this in view.

OTHER NATIONS SHOW INTEREST

Broadened horizons in appreciation of conservation were recognized in the participation by delegates of many nations to the United Nations Conference for International Organization in memorial ceremonies in honor of the late President Franklin Delano Roosevelt. These ceremonies were suggested by the Save-the-Redwoods League. Under the majestic redwoods of Cathedral Grove in Muir Woods National Monument, Calif., delegates assembled on May 19 to pay tribute to a great leader, during whose administration not only national park projects but many other conservation objectives were realized. Conference delegates also made pilgrimages to Yosemite, Sequoia, Grand Canyon, and other national parks of the West. They were impressed both with the grandeur of these places and with the governmental policy that assures their preservation for enjoyment. At the termination of the United Nations Conference, seeds of the giant sequoia, the General Sherman Tree, were made available to delegates who desired to take them to their native lands for planting. President Truman, en route to the Conference, spent part of June 22 at Mount Rainier National Park.

Efforts were continued by the National Park Service to stimulate action by the Government of Mexico toward the reserving of an area across the Rio Grande from Big Bend National Park, which would make this an international park. The regional director of region three

visited several Mexican national parks in the spring of 1945 and conferred with Mexican officials regarding the Big Bend International Park and the Coronado International Memorial projects.

Correspondence was carried on with officials at work on surveys and organization plans for national parks and national park authorities for England, Scotland, and Wales; with those of Kruger National Park of South Africa; and with park officials of Brazil.

PUBLIC NEEDS TO KNOW ABOUT POLICIES

The National Park Service looks upon itself as the guardian of perhaps the greatest living and testamentary trust ever established. The concept of conservation of a small portion of our land, not for consumption of its natural resources, but for its preservation to minister to the human mind and spirit, because of surpassing grandeur or other special and profound significance, is one almost unique to the United States of America. It is steadily gaining in interest and favor among other nations. Members of our staff returning from service abroad tell us that, even during the war, there has been much thinking and planning along these lines, particularly in Great Britain. Visitors from Latin-American countries report similar interest there.

To meet the responsibilities of its trusteeship satisfactorily, the Service is dependent on congressional support which, in the final analysis, must stem from public support. Both depend primarily upon satisfactory performance of its job and upon evidence that it is meeting the needs of the visiting public. But public approval rests not only on accomplishment but also upon understanding of Service objectives and upon satisfaction with their soundness and with progress toward attaining them.

The Service has been so occupied with carrying out the responsibilities placed on it by law, that it has had scant opportunity to keep the public informed about its fundamental policies. The millions of owners of the system are entitled to authentic information about their estate; why it exists, what it contains, where the units are situated; what principles of management are applied to it and the reasons for them. As travel to the national park system areas increases during the coming years, and more and more Americans enjoy the parks, it is the hope of the National Park Service that it can keep abreast of its obligations to tell the people of the value and the meaning of this great estate.

Office of Indian Affairs

WILLIAM A. BROPHY, *Commissioner*¹

DURING the fiscal year 1945, under difficult conditions occasioned by the war, the Office of Indian Affairs has continued to serve its dominant purpose—to protect the interests of 400,000 Indians and Eskimos in the United States and Alaska, and to aid them in becoming economically independent.

While there have been losses and costly postponements, there have been significant gains also. Owing to servicemen's allotments, to the increased quantity and value of their agricultural products, and to the wages earned by more than 40,000 Indians who have left their reservations to work in various industries, the total income of Indians has been greater than ever before. The acquaintance with a wider world and a higher standard of living acquired by many of the home folk, together with a more alert awareness and increased self-confidence of 25,000 young men and women returning from the armed services, may well prove a powerful stimulus to Indian progress.

A fundamental problem, however, is accentuated by this situation. Even with the most efficient use, Indian resources in some areas are far from sufficient to provide a decent livelihood for all Indians. A portion of the 65,000 who left their homes to fight and work, and who are now returning, can find opportunity on their reservations; but thousands cannot, and thousands of others who remained at home are in the same predicament. Since Indian resources cannot be sufficiently augmented to support the population, which is increasing rapidly, many thousands of Indians must be helped to find economic opportunity and acceptance in the general national economy.

So long as thousands of Indians exist below the subsistence level on poverty-stricken reservations, so long as employment opportunities are scarce, Federal expenditures for program services to Indians cannot be appreciably decreased.

¹ John Collier served as Commissioner of Indian Affairs until March 1945. William A. Brophy was appointed Commissioner and appointment was confirmed by the Senate the same month.

PHYSICAL RESOURCES

LAND

The Office of Indian Affairs has jurisdiction over more than 56,000,000 acres of land. Of this total, about 7,000,000 acres are classified as agricultural, with a valuation of \$90,000,000; forest lands aggregating more than 16,000,000 acres, are worth, including the standing timber, approximately \$170,000,000; open grazing lands, constituting some 32,000,000 acres, are valued at approximately \$90,000,000. The homes and farm buildings on these lands are so poor, in general, that their value may be assessed at no more than \$15,000,000.

Acquisition and Consolidation

As the land base on most reservations is inadequate for the support of the entire population, and much of it is rendered almost useless to Indians by the fractionating process of inheritance, the Indian Service, insofar as possible, has continued its program of land acquisition and consolidation.

During the past fiscal year 157,000 acres of land, formerly opened for settlement but unclaimed, were restored to the Red Lake Reservation in Minnesota, and 12,767 acres were returned to tribal ownership on the Wind River Reservation in Wyoming. In all, 257,000 acres of land were restored to Indian use.

Many tribes have been giving serious attention to the matter of providing land for their returning soldiers, and to this end tribal funds totaling \$177,000 were used last year in purchasing 63,000 acres on 12 reservations, some of the acquired land being from Indian estates complicated by heirship. With their own funds the Southern Utes reacquired 40,546 acres at a cost of \$83,000. During the year 10 tribes requested authorization to use \$250,000 of their funds for the purchase of complicated heirship tracts and lands formerly owned by Indians.

Progress is also being made in the rearrangement of land holdings through the exchange of heirship interests for the right to use tribal lands. For example, on the Rosebud Reservation in South Dakota individuals have returned 21,000 acres of their allotted and inherited lands to tribal ownership in exchange for certificates of interest in the Rosebud Tribal Land Enterprise. By this means members may acquire workable farming and grazing units in exchange for scattered fractional interests. The Enterprise is now managing 38,000 acres of allotted and tribal land, and more than 400 proposed exchanges are awaiting the availability of personnel to complete the transactions.

On Cheyenne River Reservation in South Dakota, the tribe is encouraging its members to convey their lands to tribal ownership

in exchange for assignments. All interest in 521 allotments and the undivided heirship interest in 246 allotments were thus conveyed during the past year, and 450 exchange assignments were issued. As a result, many members of the tribe have been enabled to engage in, or to enlarge, farm and livestock operations.

The marked success of this exchange procedure on these reservations reflects the Indians' own understanding of their land-use difficulties; and their efforts to solve their land-tenure problem are being closely watched by other tribes.

Oil and Minerals

Since Oklahoma's first commercial oil well, on Cherokee Indian land, came into production 48 years ago, the restricted lands of the Five Civilized Tribes have produced 459,810,138 barrels of oil, in addition to tremendous quantities of associated dry gas and casinghead gas. In the same time oil lands of the Osage Reservation have yielded 584,347,797 barrels.

The depletion of petroleum resources in Oklahoma is only partially offset by discoveries in other areas, notably on the Wind River Reservation in Wyoming, which produced 2,457,251 barrels in the fiscal year 1945, and on the Blackfeet Reservation in Montana, which yielded 2,028,019 barrels.

The total output of all Indian oil wells during the year exceeded 23,000,000 barrels. There are now 11,400 oil wells on restricted Indian lands, and 6,500 oil and gas leases are in force, covering 1,700,000 acres and involving Indians of 35 tribes in 10 states. Forty-five lease sales were held during the past fiscal year, and more than 1,000 leases were sold.

During the war period, lead and zinc held a high place in the list of strategic minerals, and the mines on restricted Quapaw lands produced some 415,000 tons of lead and zinc concentrates, valued at over \$38,000,000. In order to produce this amount of concentrates in a short period of time it was necessary to deplete reserves that would not normally have been mined at such an accelerated rate. At the end of the fiscal year there were 56 lead and zinc leases in force, covering 5,726.59 acres. Production for the year amounted to 78,248 tons of lead and zinc concentrates, which was 23.9 per cent of the production from the Tri-State district.

Forest and Grazing Lands

It is conservatively estimated that there are 35,000,000,000 feet of standing timber on 16,700,000 acres of Indian lands located in 19 States, approximately 80 percent being considered suitable for lumber. This constitutes about 2 percent of the estimated total volume of standing timber in the United States.

Of the 528,472,000 feet of timber cut and removed from Indian reservations during the calendar year 1944, the major portion has been used directly in war production. Many relatively small sales were made to provide timber for as many sawmill operations as practicable, and the sale areas have been selected and controlled according to the principles of sustained-yield management.

The Indians, through their tribal sawmill enterprises, produced approximately 30,954,500 feet of lumber during the past year. These enterprises are located on the Menominee Reservation in Wisconsin, the Red Lake Reservation in Minnesota, and the Navajo and Fort Apache Reservations in Arizona. Production was curtailed to some extent by limited labor and equipment.

White pine blister rust threatens the development of white pine in a control area of 108,870 acres, most of which is located in the Lake States. In cooperation with the Bureau of Entomology and Plant Quarantine, Department of Agriculture, 80,182 acres have been given initial treatment and 48,398 acres have been reworked, Indian women performing much of the labor involved. The pine bark beetles continue to cause considerable loss of ponderosa pine on Indian reservations in the far West. While forest management minimizes the depredations of the beetles, special control programs are necessary. These were not possible during the war, but have been planned for the postwar period.

Fortunately, the weather during last year's fire season was very favorable, and only 885 fires were reported, as compared to the annual average of 1,038 for the past ten years; but the areas affected totaled 127,742 acres, as compared to the annual average of 115,830.

During the calendar year 1944 approximately 44,000,000 acres of forest and open range lands on Indian reservations were utilized for grazing, providing forage for about 9,000,000 cattle months, with a value of approximately \$1,900,000. Of this area, 34,000,000 acres were used by Indian stockmen.

Maximum production has been maintained on Indian range lands in keeping with the principles of conservation, and overstocking has generally not been permitted. On the Navajo, Hopi, and Papago Reservations, however, overgrazing continues to be a difficult problem. Range lands on those reservations will not support a sufficient number of livestock to provide a decent living for all the Indians. Consequently the reduction of flocks and herds to the estimated grazing capacity of the land is proceeding slowly.

Soil Conservation

During the war years, farming, of necessity, has been on an exploitative basis. As a result, the nation's basic resource has decreased, and Indian lands have suffered with the rest of the country. The great

demand for peanuts, cotton, corn, and other row crops requiring clean cultivation, has resulted in annually increased acreages of these crops. Consequently, pastures and grass-crops have been much reduced, and rotations, that maintain the organic content of soil, have been postponed. Removal of the protective vegetative cover during a major portion of the year has resulted in severe erosion by wind and water.

Through conservation during the past year, soil depletion under row-crop farming in the South and Southwest has been checked to a considerable degree, in spite of limited facilities and decreased funds and personnel. Almost 27,000 acres of Indian lands were contoured; legumes were planted on 22,450 acres; strip-cropping was practiced on 13,670 acres; 4,290 acres were converted to improved pastures; 397 miles of farm terraces were built. Application of the above practices resulted in a 35 percent average increase in yield, which is only a portion of the benefit derived, inasmuch as the soil is retained in place and future productivity is assured.

As a result of the war demand from 1917 to 1921, approximately 200,000 acres of the finest Indian grazing land in the Great Plains were plowed for wheat, and less than 2 percent of it has revegetated satisfactorily. During the past year steps were taken to forestall a repetition of such land destruction as that which produced the dust bowl of the middle 1930's. Insistent demands have been made for plowing virgin sod land for flax, as the growers did not want the land that had been cropped and abandoned during the first World War. The Indian Service has cooperated to the fullest extent in securing additional flax acreage, but only under safeguards that would protect the basic soil resources. Definite soil-conserving practices were specified for each major soil class, with the requirement that land be reseeded to an adapted grass species upon cessation of cropping.

In the great Northwest wheat region, the alternate-year clean-fallow system of wheat farming has been standard practice since the country was settled. Under this system, the soil surface has a protective vegetative cover during only 3 or 4 months out of each 2-year period. As a result, the best one-third to one-half of the rich prairie topsoil has been lost by erosion. Conservation plans now in effect on 633 Indian farms, totaling 130,500 acres, have brought about many desirable improvements. A leguminous cover, instead of clean fallow, has been introduced between wheat crops on 15,000 acres; stubble, loose mulch, and rough tillage are now applied on 43,500 acres; crop rotations are practiced on 66,000 acres; 1,150 acres, formerly plowed each year, have been converted to grass. These changes have increased production, reduced erosion, and are actually restoring soil fertility.

In the Southwest, destructive flood waters have been diverted and spread on 39,150 acres of Indian range lands. This has been a major

contribution to the checking of siltation in reservoirs, and has increased carrying capacities by 600 cow years. Improved irrigated pastures, totaling 470 acres, have provided forage for an additional 1,200 cow years. Results from the reseeding of 24,895 acres of range land are not reflected in this increased carrying capacity, but if the seeding is successful, it should provide forage for an additional 600 cow years. Seedings made in previous years, have, however, resulted in increased forage equal to about 300 cow years this season.

It is difficult, if not impossible, to estimate in dollars the loss of soil from Indian land. The reduction in fertility results not only in decreased yields to the farmer, but in the filling of streams and reservoirs. There is ample evidence that the losses have been accelerated during the war; and while the conservation practices here described are helpful, they do not solve the problem involved. A soil restoration and conservation program on an increased scale is in order, and plans have been made to this end.

Land Released for Military Use

During the war, over half a million acres of land passed out of Indian ownership to be used by the Government for air bases, gunnery ranges, bombing practice areas, etc. The permanent loss of so great an acreage would be a heavy blow to Indian economy, and it is hoped that not only the half million acres devoted to military purposes, but additional areas of grazing land also, may be made available for Indian use.

Colorado River Resettlement

Although, by provision of the act of 1865, the Colorado River Reservation was set up "for the Indians of said river and its tributaries," no colonization of Indians from the tributary areas was found feasible during three-quarters of a century, owing to the general desert condition of the land and the lack of irrigation facilities.

With the completion of the Headgate Rock Dam and distribution system at the outbreak of the war, colonization became feasible; and during February 1945, the Council of the Colorado River Tribes adopted an ordinance opening the southern three-fourths of the reservation to colonization by Indians of the Colorado River watershed. During May 1945, the War Relocation Authority returned to the control of the Indian Service about 2,000 acres of subjugated land in the southern area.

The Indian Service entered into negotiations with the Hopi Indians, who had expressed interest in migrating to the Colorado River Reservation, and applications were received from 20 families for permits to occupy 40-acre units to be available September 1, 1945.

EXTENSION ACTIVITIES

Livestock

As only about one-eighth of the total Indian land base may be classified as agricultural, livestock raising is of necessity the chief industry of the Indians. Accordingly, during the past year, as throughout the past decade, it has been one of the principal functions of the Indian Service to aid Indians in increasing the numbers of their stock, in improving its quality, and in establishing efficient marketing methods.

Livestock numbers have been, and are being, steadily increased. In 1932 Indians owned a total of 170,700 beef cattle and 11,300 head of dairy stock. That year total income from sales of livestock and livestock products was \$1,229,800. By 1943 the number of their beef cattle had been doubled, their dairy herds had increased to more than 50,000 head, and the total cash income from both was nearly \$14,000,000. In the calendar year 1944 the number of Indian-owned beef cattle was 361,300, the dairy cattle numbered 50,700, and the total income from these sources was \$15,039,000, while the livestock and livestock products consumed at home had a market value of \$7,431,410.

It is a much simpler matter to increase the numbers than to improve the quality of the stock. During the past year continued efforts were made to aid Indians in securing better sires with each successive purchase and in culling inferior animals. As a result, a marked improvement is to be noted in many Indian herds. Some reservations are now operating breeding cattle herds for the production of superior bulls. At Fort Apache and San Carlos registered cows are being artificially inseminated. It is found that about 10 times the normal number of calves may thus be sired by one outstanding bull, and greater uniformity of quality may be obtained.

Improved marketing methods have aided greatly in augmenting Indian income from livestock. To this end cooperative livestock associations have been organized on most reservations, and 149 of these were in operation during the past year. Usually livestock are owned individually, but are managed and marketed cooperatively.

Improving Navajo Sheep

During the past quarter of a century there has been a steady decline in the quality of Navajo rugs because of a diminishing supply of suitable wool. The Indian Service has introduced fine-wooled rams for cross-breeding with native Navajo ewes to increase unit production and improve the quality of wool and lambs for the market. This has resulted in raising the market value of both wool and lambs, but the wool still lacks some of the qualities desirable for hand-weaving.

The laboratory at Fort Wingate, N. Mex., operated jointly by the Bureau of Animal Husbandry of the Department of Agriculture and the Indian Service, is endeavoring to develop a type of sheep better suited to the economic needs of the Navajo Indians than either the fine-wooled or old-type Navajo sheep. Although only three generations of cross-bred offspring have been produced, definite progress has been noted. Last year the average clean-wool production of the cross-bred ewes in the experimental flock was almost 100 percent greater than the 1936 production of the foundation Navajo ewes; but at least eight generations will be required to establish the desired type.

Agriculture

In the Southern and Southwestern States, forage is produced chiefly through the development of pastures. On most northern reservations the critical factor in the livestock industry is the production and storage of feed for the winter months. In 1944, 436,794 tons of forage crops, with a valuation of \$4,793,911, were harvested on 396,600 acres of Indian land.

Although Indians in general depend chiefly upon livestock for their cash income, other cash crops have been increasing during the past decade. In 1943, 370,000 acres of cereal crops yielded 3,780,000 bushels. In 1944, only 340,000 acres were planted, but the yield of cereals increased to 4,839,500 bushels with a market value of nearly \$5,000,000. Other field crops were valued at \$3,682,400, while tree fruits, nuts, and berries, sold and consumed, were worth \$775,600.

The Indian Service has continued to stress the importance of gardening. In 1944, 31,800 families raised gardens, the home-consumed produce therefrom being valued at \$1,280,000.

Experimental Work at Sacaton

At the United States field station, Sacaton, Ariz., the Indian Service cooperates with the Bureau of Plant Industry, Department of Agriculture, in conducting experimental work on crops in the Southwest. During the war years research work has been modified so as to contribute to war needs as much as possible.

New strains of cotton, developed at the Sacaton station, have contributed millions of dollars to the income of Southwestern cotton growers, and other promising strains are now being worked out. Greater attention is being given to the long staple varieties, such as American-Egyptian and the SXP; and the station is taking the lead in furnishing an adequate supply of reliable seed for growers. Valuable contributions have been made to the knowledge of cotton diseases as a result of investigations at Sacaton. Worthwhile work is also being done with flax, and pasture experiments are being conducted to test the suitability of various grasses, clovers, and other forage plants.

Home Extension Work

The home-extension program of the Indian Service, designed to assist Indians in making better use of increased production and income, operates principally among Indian women. It is concerned largely with food conservation and nutrition, although clothing, sanitation, living expense budgets, and furniture-making also receive attention. The responsiveness of Indian women to this type of service is indicated by the fact that food canning has increased from 354,000 quarts in 1932 to 3,600,000 quarts in 1944; while in the same period the drying of foods has increased from 803,700 pounds to 1,590,000 pounds.

4-H Clubs

As the training of youth largely determines the attitudes and ideals of maturity, Indian Service extension workers have continued to promote 4-H Clubs among Indian youth as a part of the national movement. 4-H Club work supplements classroom teaching with practical experience in agriculture, stock-raising, and home-making, and serves to develop leadership among Indian boys and girls. It also aids greatly in persuading parents to adopt improved cultural and farm-management practices. The interest in the movement among Indian boys and girls is evidenced by the increase in enrollments from 3,871 twelve years ago to 12,916 in 1944.

Credit Without Money

The creation of a revolving cattle pool in 1934, as a result of drought conditions, has proved to be a wise and profitable venture. During that disastrous year of grassless ranges, the Government purchased large numbers of cattle to relieve stricken stockmen, and as Indians in some areas had feed and needed cattle, arrangements were made with the Federal Surplus Relief Corporation and the Department of Agriculture whereby high-grade and purebred cattle were turned over to the Indian Service. These were loaned to Indians on contracts providing for repayment in kind; and it was planned that cattle, when repaid, would be loaned on the same basis to Indians on reservations which were not originally included in the program.

The revolving cattle pool began with about 40,000 head. At the end of 1944 more than 60,000 head had been repaid and recontracted, and about 12,000 had been transferred to reservations where the Indians were unable to participate in the program at the beginning. The cattle pool has served to save thousands of America's foundation stock and has enabled about 10,000 Indians to engage in the cattle business.

Money Credit

Adequate financing became available to Indians for the first time when the initial appropriation was made for the revolving loan fund authorized by the Indian Reorganization Act of 1934.

Loans are made by the United States to Indian chartered corporations, unincorporated cooperative associations, and individuals. Funds thus acquired by tribes and associations may be used in making loans to members. Repayments are returned to the fund and become available for further loans. The fund authorized was \$12,000,000, and thus far a total of \$4,428,400 has been made available. Up to and including the fiscal year 1945 the United States has made commitments aggregating \$7,631,712.48. Of this amount \$5,533,082.48 had been advanced, while a total of \$2,532,798.23 had been repaid.

The repayment record of the Indians has been improving steadily. In 1941 the percentage of delinquencies was 7.64; in the following year it decreased to 4.95; in 1943 it was 3.41. Last year only 2.94 percent of the amount due on loans was delinquent.

ENGINEERING**Construction**

Exclusive of irrigation works, roads, sidewalks, landscaping, street lighting, and equipment, the physical plant of the Indian Service consists of nearly 15,000 buildings worth \$50,000,000, with a replacement value of twice that amount; more than 400 water and sewerage systems valued at about \$8,000,000; 15,000 wire-miles of telephone lines worth approximately \$1,600,000; and 181 radio transmitters in a system valued at \$60,000.

Since Pearl Harbor, funds and manpower as well as available materials have been insufficient to maintain these facilities in a good state of repair, and it is estimated that more than 6 million dollars will be required to put them in such a condition that a million and a half dollars a year will be sufficient to maintain them. During the past 3 years, funds for repair and maintenance have been reduced to half that amount.

In view of postwar programs, the need for additional buildings is urgent, and the need for new hospitals, schools, cottages, dormitories, utility plants, extensions, and modernizations, will be made the basis of requests for annual appropriations. The greatest present need is for funds to make surveys and prepare plans for necessary postwar construction.

Reservation Roads

The roads constructed on Indian reservations during the past decade have greatly aided the Indians in expanding their food production for war use, and have facilitated the transportation of critical

var materials found on reservations, such as timber and various minerals. During the war, only access roads to sources of such materials have been built—a program for which expenditures have exceeded a million dollars.

The capital investment represented by some 18,000 miles of roads and trails on Indian lands is approximately \$50,000,000. As a result of inadequate maintenance, it is estimated that the loss on the original investment from Pearl Harbor to VE day has been at least \$5,000,000. The cost of construction and reconstruction necessary to complete efficient transportation facilities on Indian reservations has not been accurately computed, owing to lack of funds for the necessary surveys; but reservation superintendents report that additional roads are greatly needed.

Irrigation

On many of the reservations, particularly west of the ninety-seventh meridian, irrigated land plays an important part in the economy of the Indians. There are at present approximately 840,000 acres in over 250 Indian Service projects that are supplied with irrigation facilities. About one-fourth of this land is in white ownership. This irrigated area compares with about 4,000,000 acres served by Bureau of Reclamation projects, and with a total of 355,000,000 acres of agricultural land in the United States.

The present investment in Indian Service irrigation projects is about \$67,000,000, and it is tentatively estimated that about \$93,000,000 will be needed for the completion of facilities necessary to serve a total of 1,650,000 acres of irrigable Indian land. About \$30,000,000 of the total investment would be chargeable to power development, leaving an average cost of less than \$80 per acre for irrigation purposes.

The value of crops grown on irrigated Indian lands in the calendar year 1944 exceeded \$30,000,000, approximately half the total cost of constructing the irrigation projects involved.

The principal immediate need is for the completion of surveys of all potentially irrigable lands, after which the ultimate area of each project can be accurately determined and plans can be formulated for development. During the fiscal year 1946 as much of this work will be done as may be possible within the limitation of available funds and manpower.

INDIAN CLAIMS

The California Land Claims

In December 1944 a judgment was entered in the United States Court of Claims, allowing the California Indians to recover from the United States \$5,024,842.34, in partial satisfaction of claims arising from the Senate's failure in 1852 to ratify 18 treaties made with these

tribes. Under these treaties the Indians ceded 75,000,000 acres of land, in return for which they were promised definite reservations aggregating 8,619,000 acres. They received only 624,000 acres, much of it poor and unproductive land. The judgment finally awarded to them represents the difference between the estimated value of lands, goods, and services promised them under the treaties, and the cost of services since rendered to them by the Federal Government. This amount has been placed in the Treasury to the credit of the Indians, to draw interest at 4 percent per annum, and appropriations from it will be authorized by Congress for the benefit of the Indians.

The Menominee Swamp Lands

Litigation concerning the Menominee Reservation, Wis., was settled in June 1945 when the Federal Government paid the State of Wisconsin \$1,590,854.50 for 33,870.23 acres of swamp lands within the boundaries of the reservation. When the treaty of 1854 was signed with the Menominees, this land was included in the forest area reserved to the Indians, but the State of Wisconsin claimed prior rights under the Swamp Land Act of 1850. The State's claim was upheld, and in order to fulfill the terms of the treaty with the Menominees the United States acquired the land by purchase, to be held in trust for the tribe. The Indians elected to take the swamp lands rather than a cash payment because the timber on these lands was necessary to maintain their lumber operations on a sustained yield basis.

The Sioux Pony Claims

Reexamination of claims for losses of personal property suffered by the Sioux Indians more than 60 years ago was completed during the year, and it was decided that an additional sum of \$101,630 should be awarded to the claimants. A bill to authorize the appropriation of this amount was passed on June 30, 1945. These claims for the loss of ponies, wagons, guns, and other personal property originated during and after the Indian war of 1876, when the Army seized or destroyed the possessions of friendly and neutral Indian bands as well as those of the hostiles. Horses were taken wherever found, and most of the claims presented were for these horses. In 1889 and 1891, the sum of \$416,260 was appropriated for the payment of these claims, and in 1932 a further payment of \$19,357 was authorized, although many claims were disallowed at that time.

The Northwestern Shoshone Decision

A Court of Claims decision against the Northwestern bands of Shoshone Indians was upheld by the Supreme Court in March 1945. The Shoshones had asked for \$15,000,000 in compensation for lands relinquished to White occupation, but the Supreme Court held, in a

5-4 decision, that the Treaty of Box Elder in 1863, which granted rights-of-way across the Shoshone country, did not show intent to recognize Indian title to the territory involved.

The decision was notable for the concurring opinion of two of the justices, who pointed out the inadequacy of judicial decisions in cases of this kind, and in substance called on the Congress to provide other machinery and other remedies. The justices concluded that a moral obligation rests on the whites to do for the Indians "what in the conditions of this twentieth century is the decent thing to do."

An Indian Claims Commission

During January 1945, bills were introduced in the House of Representatives to set up an Indian Claims Commission for the purpose of investigating all Indian claims—legal, equitable, and moral—and disposing of them finally within a period of ten years.

The Indian Office has long urged the creation of such a commission as a means of expediting the solution of a vital problem.

HUMAN RESOURCES

EDUCATION

The war caused the greatest disruption of Indian life since the beginning of the reservation era. Thousands of young men and women left high school to join the armed forces, and hundreds of youngsters took jobs. Thousands of Indian families left the reservations for war employment, usually taking their children with them. Consequently there has been a progressive decrease in school attendance at all levels, as the following table shows:

	1942	1943	1944	1945
Nonreservation boarding schools.....	6, 513	5, 680	5, 363	5, 550
Reservation boarding schools	5, 609	5, 268	5, 162	5, 730
Day pupils in boarding schools.....	1, 697	1, 296	1, 348	1, 531
Special consolidated schools.....	4, 150	3, 409	3, 600	3, 605
Day schools.....	7, 870	6, 554	6, 346	6, 086
Total.....	25, 839	22, 207	21, 828	22, 502

Most centers of war industry to which Indian families moved were seriously overcrowded, and housing and school facilities were inadequate. In some places local school authorities discouraged attendance of Indian children at public schools. Indians are not aggressive, and many families have yet to reach the conviction that education is a precious heritage to be obtained for the children at whatever cost to the parents. Therefore a little discouragement was enough to keep many Indian children out of school. In some areas this resulted in an increased enrollment in Federal boarding schools.

The educational field agent, whose duty it is to encourage public school attendance by Indian children, has in many cases extended his responsibility in an endeavor to pave the way for admission of these Indian children into the public schools of the adjacent area. Since there has been no concentrated movement by Indian families, the geographical spread of these newer problems of school attendance has tended to nullify the effectiveness of such endeavors.

Much of this loss of education is irreparable, for most young Indians are not yet ready to place the need for education above the opportunity to earn wages, to marry, or to assume in other ways the responsibilities of adulthood. Therefore it is doubtful if many of the older children will return to the classroom.

On the other hand, Indians in the armed forces have been learning the value of education. Hundreds of young men and women, returning to their homes on furlough, have emphasized the promotional advantage they have enjoyed as a result of vocational training received in Indian Service Schools, or lamented their failure to obtain such training when they had the opportunity. The armed forces have been quick to recognize and make use of the technical skills gained by young Indians in the vocational schools of the Indian Service and in the Civilian Conservation Corps camps. Similarly, those boys and girls who entered war industries on the strength of their vocational training have realized the advantage they possess; and these have advertised on the reservations the need for Indians to make the most of educational opportunities offered in Federal schools.

During the year, the Navajo tribe, the education of whose children has been seriously neglected by the Federal Government, demanded by resolution that the United States fulfill its pledge given in the Treaty of 1868 to provide a classroom and teacher for every 30 children of school age. There are today almost 20,000 Navajo children between the ages of 6 and 18, and the school facilities on the reservation will care for less than 60 percent of them. During the war period the lack of road maintenance and the limitations on tires, gasoline, and school bus replacements have interfered seriously with the maintenance of the day schools. As a result, the largest enrollment ever recorded has crowded into the boarding schools of the area, and it has been necessary to turn away hundreds of children whose parents wished them to have the advantages of education.

Inadequate transportation for students has made it necessary to close day schools on several other reservations. The end of the war may permit the replacement of school buses, and as the transition to peacetime economy proceeds, funds may be made available for the restoration of needed road maintenance and construction.

It is still too early to predict the part which may be played by the vocational schools of the Indian Service in the training to be offered

under the several veterans' bills. Nine Indian Service boarding high schools have been accredited by State vocational directors for training under the G. I. Bill of Rights, and under Public Law 16, which covers the retraining of disabled veterans. During the year just past only five of these schools have received enrollees under either of these acts; but, in view of reservation sentiment in many areas, it is believed that an increasing number will apply to the Federal schools in the year ahead.

During the past year half of all the food, both meats and vegetables, used in the Indian Service boarding and day schools, was raised in school gardens, or on school farms and ranches, through the cooperative effort of students, parents, and employees.

During the year four significant publications have issued from the presses of Indian schools: *The Hopi Way* by Laura Thompson and Alice Joseph; *Pueblo Crafts*, by Ruth Underhill; *Iroquois Crafts*, by Carrie Lyford; and *Education for Action*, edited by Willard A. Beatty, Director of Education. The last-named volume, a compilation of articles from the Bureau's fortnightly publication, *Indian Education*, presents a summary of the philosophy, policy, and practice of Indian schools.

HEALTH

The United States Indian Service offers medical attention to more than 400,000 beneficiaries of the Federal Government in the continental United States and Alaska. This is the only agency that makes available to its clientele complete medical attention throughout the life-cycle of the individual. The activities of the health service include health education, disease- and accident-prevention procedures, palliative treatments, rehabilitation, and sanitation.

During the fiscal year 1945 there has been increasing community participation in health activities throughout the service; and health councils, representing the people, are active on a number of reservations.

There are at present 77 hospitals and sanatoria with a bed capacity of 4,064. The Indian Service also has contracts with a number of State, county, and private hospitals. During the past year 750,000 out-patient treatments were given, and 40,000 patients were hospitalized with a total of 865,590 in-patient days. Forty percent of the cases involved operations, of which half were major. A conservative estimate of the annual value of these services at current rates would be no less than \$15,000,000.

As the Indian Service is not a war agency, war activities and private practice have drawn heavily on its health personnel, temporarily limiting its activities to curative and palliative measures. This situation will improve rapidly in the postwar period.

WELFARE

Despite all employment opportunities, it has been necessary to give relief to needy Indians. Although the number of cases has been reduced, available funds have been insufficient, and the problem of relief during the coming fiscal year will be even more serious.

Much attention has been given to the matter of rendering necessary services to veterans and to those returning from outside employment. The Indian Service makes available to the Indian veteran all information concerning benefits to which he is entitled under veterans' legislation, and urges him to take advantage of the provisions which will help him to continue his education, or to establish himself in business, agriculture, or industry.

During the past year the Territory of Alaska enacted three laws removing discrimination against the natives in the matter of mothers' pensions, in dealing with juvenile offenders, and in the matter of admission to hotels and other institutions serving the public.

More and more tribes and tribal councils are adopting resolutions providing that Indian custom marriage and divorce shall no longer be recognized. In accordance with the request of the Klamath Indian business committee, the Congress passed a law in December of last year which abolishes Indian custom marriage and divorce on the Klamath Reservation.

During the year the State of Iowa enacted a law providing aid to dependent children for Indians of the Sac and Fox Reservation.

Law and order problems have increased during the year, and juvenile delinquency, both on and off the reservations, has become a major problem.

EVALUATIONS**INDIAN RESOURCES**

The 56,000,000 acres of Indian lands, constituting about 3 percent of the total area of the United States, are estimated to be worth \$260,000,000.

Standing timber on Indian lands, estimated at 35,000,000,000 feet, and valued at approximately \$90,000,000, is about 2 percent of the total volume of standing timber in the United States.

No estimate of the value of oils and minerals on Indian lands is available.

Indian livestock, numbering more than 361,000, is worth approximately \$40,000,000, as compared with 82,000,000 head for the entire country with an estimated valuation of \$5,500,000,000.

The physical plant of the Indian Service is valued in excess of \$60,000,000. Roads on Indian lands represent an investment of \$50,000,000.

Indian Service irrigation projects serve 840,000 acres of land, three-fourths of which is owned by Indians. This total compares with 28,000,000 acres served by all irrigation projects in the United States, according to the 1940 census report. The present investment in Indian irrigation projects is \$67,000,000, to be compared with a total investment of more than \$1,000,000,000 for the United States, according to the census of 1940.

SERVICES TO INDIANS

While it is impossible to place a money valuation on all services rendered to Indians by the Office of Indian Affairs, it may be stated with accuracy that for each dollar spent on extension activities in agriculture and stockraising, \$46.80 was realized by the Indians in 1944.

Health services rendered to Indians by the Office of Indian Affairs, if paid for at current rates, would cost \$15,000,000 annually.

According to the latest bulletin published by the Office of Education, 24,562,473 pupils were enrolled in the public schools of the Nation for the school year 1941-42, with an average attendance of 21,031,322. The total expenditure for that year was \$2,067,660,387, and on the basis of average attendance, the cost per pupil was \$98.31.

During the same period, 32,658 pupils were enrolled in schools maintained by the Indian Service, with an average attendance of 26,617. Total expenditures for the maintenance of these schools was \$4,632,610 and the cost per pupil, on the basis of average attendance, was \$174.05. In this connection it should be noted that a rather large percentage of Indian pupils attend boarding schools, where they are fed, clothed, and housed. Also, in practically all Indian Service day schools, it is necessary to serve a substantial noon meal; and, as Indians usually live in poorly developed regions and are scattered over large areas, transportation must be furnished.

INDIANS IN THE WAR

By the Spring of 1945, the number of Indians serving in the armed forces had reached a total of 24,521, exclusive of officers. These were in all branches of the service, in every part of the world. Several hundred Indian women have enlisted in the women's reserves, and almost every reservation and tribe lists members of the WAC, the WAVES, the Army Nurse Corps, or the Cadet Nurse Corps.

Indians have won nearly all decorations, including two awards of the Congressional Medal of Honor. The first of these was won by Lt. Ernest Childers, Creek, in 1944, and President Roosevelt presented the second to Lt. Jack C. Montgomery, Cherokee, of Sallisaw, Okla., at the White House in January 1945. The Office of Indian

Affairs has recorded 51 awards of the Silver Star to Indians, 70 of the Air Medal, 34 of the Distinguished Flying Cross, and 50 of the Bronze Star Medal. There are certainly many more which have not been reported.

Pfc. Ira H. Hayes, a full-blood Pima Indian from Bapchule, Ariz., was one of the six men who raised the flag on the summit of Mount Suribachi on Iwo Jima, as shown in the famous photograph by Joe Rosenthal. Many Indians took part in the battles on Iwo Jima and Okinawa, as the casualty lists show.

A Ute Indian, Pvt. Le Roy Hamlin, was with the first group to cross the Elbe River and make contact with the Russian Army, on April 25, 1945. Another Ute, Pfc. Harvey Natchees, wearer of the Bronze Star Medal and the Purple Heart, was the first American soldier to enter the center of Berlin.

Many Indian prisoners of war, released from German camps, have returned to the United States. Among those freed from Japanese prisons in the Philippines was Maj. Caryl Picotte, Sioux-Omaha, from Nebraska, who spent 32 months in captivity. Major Picotte served in the heroic defense of Bataan, where he was recommended for the Distinguished Service Cross and the Silver Star, and was in the "death march" to Cabanatuan prison. Lt. Col. Ernest McClish, Choctaw, who was reported missing in action at the time of the surrender on Bataan, came home after nearly 3 years as guerrilla leader in the Philippines where he helped to organize both civilian and military resistance.

During the past year Indians continued to leave the reservations for jobs in the war industries. Navajos and Hopis provided the manpower for ordnance depots in New Mexico and Arizona. Pueblo Indians traveled to Utah to work in the naval supply depot at Clearfield, returning during the summer months to farm their lands. More than 40,000 Indian men and women annually took war jobs away from their reservation homes.

Indians not only increased food production at home, but contributed to victory by working for the Red Cross and for the war loan drives. Many communities, where cash incomes are small, have made large contributions to the Red Cross, and war bond quotas have frequently been oversubscribed.

In April 1945 more than 400 Aleuts, who had been evacuated from the islands when the Japanese invaded the Aleutians in 1942, returned to their homes. They had been resettled on the mainland, near Juneau and Sitka, where, for nearly 3 years, they worked in canneries and engaged in fishing. The Army and Navy, with the help of Indian Service architects, will rebuild their war-wrecked villages; and Indian Service teachers and special assistants are helping the natives to reestablish themselves in their homeland.

Division of Territories and Island Possessions

BENJAMIN W. THORON, *Director*¹

THE territorial areas of the United States—Alaska, Hawaii, Puerto Rico and the Virgin Islands—are giving accelerated attention to their ultimate political destiny. Believing that these areas should have the opportunity to determine for themselves their political relationship with the continental United States, the Division of Territories has aided in the formulation of policies that conform to each area's aspirations.

The Division assisted in the drafting of the Statehood bill for Alaska which was introduced by Alaska's Delegate to the Congress, E. L. Bartlett. Pending the time that this may become a reality, it has begun a complete revision of the Alaska Organic Act, which has had only fragmentary revisions since 1912 and which in many of its provisions is obsolete, retaining for the Federal Government functions which the territory is well able to perform for itself. The revisions now being drafted would provide for an elected Governor, for additional taxing power in the legislature, for a complete territorial judicial system and for other reforms which would give the territory a political and economic base from which the transition to statehood would be facilitated.

Hawaii's Delegate, Joseph R. Farrington, has also introduced a statehood bill for that territory which the Division helped to draft. As in the case of Alaska, it is felt that a revised Organic Act, extending especially a greater amount of political responsibility to Hawaii, will provide a sensible and logical transition to statehood. Consequently the Division has conducted preliminary studies of the Hawaiian Organic Act, with a view to its reform.

Puerto Rico has a politically mature people who, after 45 years of waiting, also are urging a speedy determination of their political relationship with the United States. Senate bill 1407, in the drafting of which the Division participated, and which provided for an elected Governor and considerably increased local autonomy, failed of passage in the Seventy-eighth Congress. Late in the year,

¹ Resigned effective June 30, 1945, and was succeeded by Edwin G. Arnold.

the Senate Committee on Territories and Insular Affairs held hearings on Senator Tyding's independence bill and the Division arranged for Puerto Rican representatives to testify. From this came a new bill, drafted by a joint commission of the Legislature of Puerto Rico, which was introduced in the Senate by Senator Tydings (upon request) as Senate bill 1002 and by Commissioner Jesús T. Piñero of Puerto Rico in the House as House bill 3237. This bill would authorize a plebiscite so that the people of Puerto Rico could decide by democratic means whether they favor independence, statehood or a dominion type of status.

The Organic Act of the Virgin Islands has been under the practical test of actual usage only since 1936, but in that time various defects have shown themselves which make it short of ideal and the Virgin Islanders themselves have created an Organic Act Reform Committee which is busily engaged in drafting proposed amendments to the act. Among the Committee's proposals which are being carefully considered by the Division is one which would give the Islands a representative in Congress. They alone among United States citizens of territories and possessions do not now have such representation.

Knowing that governmental techniques are acquired only through actual working experience in government, the Division has recommended the appointment of qualified Virgin Islanders to positions of responsibility when vacancies occur. The posts of Executive Assistant to the Governor, Commissioner of Finance, and Superintendent of Schools for St. Croix have all been filled by local persons in the past year.

Greater political autonomy, whether it takes the form of statehood, independence or an intermediate form of status, must rest on a sound economic and social structure to be successful and the Division has aided the territorial areas toward this end.

Major attention was devoted during the year to the formulation of a program intended to implement an order from the late President Roosevelt following his speech at Bremerton on August 12, 1944. In that speech he stated:

* * * I am going to set up a study of Alaska and the Aleutian Islands as a place to which many veterans of this war, especially those who do not have strong home roots, can go to become pioneers. Alaska is a land with a very small population * * *. I am convinced that it has great opportunities to those who are willing to work and to help build up all kinds of new things in new lands * * *.

A preliminary program was immediately drafted in cooperation with the various bureaus of this Department, and with agencies of the Department of Agriculture, recommending projects in every economic field that show promise of supporting additional population

in Alaska. It included such diverse activities as a land classification program to aid homestead settlement and experimental fishing operations intended to "prove up" the undeveloped ground fishery resources. Other parts of the program included the completion of the basic topographic mapping of the Territory, mineral investigations, water resource investigations, planning for the development of the recreational resources, improvement of spawning streams to increase the runs of salmon, an increase in experimental work on the breeding and feeding of fur animals, surveys of roads necessary to postwar development, a number of projects in support of agricultural development, such as soil management and fertilizer investigations, and studies of the economic possibilities of agriculture in Alaska.

A budget for the conduct of the program was submitted to the Congress with the approval of the President, as a part of the First Supplemental Appropriation bill for 1945. This program was rejected as being too ambitious to initiate during the war period. The Division then undertook to prepare a modified study program for inclusion in the regular budget of the Department of the Interior for the 1946 fiscal year, every attempt being made to comply with suggestions made in the course of the previous hearings. However, the modified program did not prove to be acceptable and all funds for the study suggested by the President were eliminated from the appropriation bill. It is still hoped that the major parts of the program may be undertaken.

As a result of the interest stimulated by the President's speech, the volume of inquiries about postwar opportunities in Alaska from people in all parts of the Nation, particularly from men in the armed services, has increased to an average of over 600 inquiries a month. These request detailed information on such subjects as the cost of living, communication and transportation facilities, climatic conditions, business, trade, employment and prospecting opportunities, requirements to practice in professions, and methods of acquiring land in the agricultural regions of Alaska.

The Division has continued to work closely with all Federal agencies functioning in the Territory, as well as with Territorial officials and other agencies within the Department, in planning for the postwar development and settlement of the area.

A program was worked out with the War Manpower Commission under which that agency agreed to recruit civilian workers for The Alaska Railroad to replace the railroad operating battalion which the War Department had made available to the railroad in 1943. The recruitment program was sufficiently successful to permit the removal of most of the military personnel before the end of the fiscal year.

The Division, in cooperation with the Delegate in Congress from Alaska, conducted negotiations with the War Shipping Administration

to secure continuation of the wartime waiver of the coastwise navigation law, thus permitting continued service to Alaska by Canadian coastwise vessels so long as the number of American vessels continues to be inadequate to serve the requirements of the Alaska trade. These representations succeeded in securing extension of the waivers.

The Division represented The Alaska Railroad, the Alaska Road Commission and the Alaska Rural Rehabilitation Corporation in numerous contacts with other Government agencies, in discussing and solving problems of labor relations, acquisition of property, establishing priorities for obtaining equipment, and other matters requiring attention in Washington.

The House Committee on Territories secured the enactment of a resolution directing the Committee to investigate the various political and economic problems in Alaska. The Division has worked closely with the Committee in arranging for the investigating trip for the summer of 1945. A member of the Division will accompany the Committee.

After nearly three years under martial law, the Territory of Hawaii in October 1944, had restored to it by Presidential proclamation the privilege of the writ of habeas corpus. The military no longer tries civilians for offenses against Territorial law and except for certain restrictions the citizens of Hawaii have regained their peacetime status. The Division of Territories had long been working toward this end. It early believed that the public safety no longer required government under martial law and urged this view upon both War and Justice Departments.

Through the Division's effort, a number of continental companies will build plants and establish offices in Hawaii during the postwar period so as to take advantage of Hawaii's position for an expanding economic market in the Pacific area.

During the year the Civil Aeronautics Board entertained applications for certificates to operate routes between the United States and Latin America via the Caribbean area, to Asia across Alaska, and to the Orient and Australia by way of Hawaii. As the Federal agency charged with protection of interests of the territories and possessions, the Department entered an appearance as intervenor in the appropriate proceedings on behalf of Puerto Rico, Alaska, and Hawaii.

Patterned partly upon a program known as "BAWI," or "Balance agriculture with industry," which was inaugurated by the State of Mississippi, the Insular Government of Puerto Rico, through its Development Company, is engaged in sponsoring and encouraging the establishment of industries which will supplement the Island's agricultural economy and put its people to work.

Through the War Production Board the Division secured priorities for an \$890,000 clay products plant, which will utilize Puerto Rican

clays in the manufacture of structural tile, brick, sewer pipe, and other heavy glazed products, as well as dinnerware, gardenware, sanitary ware, etc. Priorities were also secured for the construction and equipping of a paperboard mill which will have a capacity of 8,000 tons of paperboard a year and which will utilize the Island's waste paper and some of the bagasse pulp from its sugar mills to manufacture containers for the bottles now being produced in the new glass plant. Continuing aid to the Insular Government in reaching capacity production in the glass plant, the Division presented the plant's case for additional equipment to the WPB. Final capacity of the plant when all units are in operation will be in the neighborhood of 57,600,000 bottles of 16-ounce weight annually. The plant is one of the most modern in the world and will employ several hundred persons directly and several hundred more indirectly.

The Division, the Insular Government of Puerto Rico, and the Government of the Virgin Islands believe that the American-Caribbean offers attractive opportunities for industrial capital from the continental United States and from the islands to establish new as well as branch plants to supply the sizable local market and the vast markets in South and Central America. Full cooperation is being given the local governments in making these opportunities known. Through these efforts a leather company with its main office in New Jersey is now running a branch plant in Puerto Rico which will soon be employing, if it is not already, more than 700 persons. The Division dealt also with a company from New Jersey which manufactures leather eyeglass cases, a silverware factory in Baltimore, perfume companies in New Jersey and Chicago, a frozen foods company which is interested in quick-freezing Puerto Rico's pineapple, a sausage casing company in Chicago, a bicycle plant in Ohio, a soft drink firm in New York, a watch company, a diamond-cutting concern from Belgium, several rug concerns in New York, a ceramics importer in Florida, an elastic products firm, furniture plants in New York and Chicago, a large citrus-fruit grower in Florida who was interested in securing fancy gift baskets for his products, and a coconut fiber plant.

When War Production Board Order M-388 was being formulated to give priority assistance to manufacturers of medium-priced wearing apparel, it became obvious that the hand needlework trade of Puerto Rico, the Island's third largest industry, would suffer a death blow and that most of the industry's 50,000 employees would be thrown out of work. Director of War Mobilization and Reconversion, Fred M. Vinson, agreed that this would be disastrous to Puerto Rico's economy and requested the WPB to make special provision for the Island. Following prolonged discussions with the WPB and with industry representatives in Washington and in New York, the Division began the allocation of fabrics totaling 17,200,000 yards annually.

So that the Insular Government of Puerto Rico might start its expanded educational and health program, this office worked with the WPB to secure priorities for health subunits and school units. Approval was secured for the latter and 250 new school units will now be made available in the Island.

Arrangements were made with the Geological Survey to assign geologists to Puerto Rico, on a reimbursable basis, to conduct a preliminary survey for oil; with the Fish and Wildlife Service to study fish resources; with the Navy Department for the release by Navy, as surplus to its needs, of the greater portion of the 21,000 acres on Vieques Island, Puerto Rico, previously acquired in condemnation proceedings for naval purposes.

The Civilian Food Reserve Unit of the Division of Territories, working with the Office of Supply of the War Food Administration, during the year procured and shipped to Puerto Rico and the Virgin Islands a total of 503,294 tons of foodstuffs and fertilizers. In accordance with the expressed policy of the Department, the Division has been for a long period returning to the regular trade channels the procurement of many of the food and feed commodities, and is completing final arrangements to discontinue all governmental procurement.

Agreements were reached with the debtors and approved by the Department in 478 hurricane relief loan cases, making a total of 1,704 loans which had been adjusted at the end of the year. Approximately 540 loans require further action. Collections for the year amounted to \$137,686.05, as compared with \$135,835.05 in the preceding year. The total sum of \$913,113.46 has been realized from collections during the years 1938-1945.

Following the policy of delegating controls to the municipalities wherever possible, the Division arranged, at the request of the municipal council, for the community to lease and operate the federally owned St. Thomas Meat Market and Cold Storage Plant in Charlotte Amalie, Virgin Islands. Meats for this plant come principally from the St. Croix abattoir, which is operated under a lease with the St. Croix Livestock Association. During the past year 794 cattle, 277 sheep and 119 hogs were slaughtered at the abattoir and sold as government inspected meats.

The net profit from general operations of The Virgin Islands Co., before income tax, totaled \$38,458.46. Approximately 45 percent of the \$515,383 of total municipal revenues in St. Croix was paid by the company. Sugarcane cultivation increased 20 percent due, principally, to the Commodity Credit Corporation support payment of approximately 90 cents per ton of cane.

The Division continued to exercise certain fiscal responsibilities in connection with the Philippines. The total of Philippine public funds on deposit in the United States on June 30, 1945, amounted to

\$481,218,704.92. During the year, payments in total amount of \$26,062,777.81 were made by the Division from funds of the Philippine Government to meet obligations of the Commonwealth.

ALASKA

The year ending June 30, 1945, marked the transfer of military activities from all Alaska to the westward half of the Aleutian Islands. The decommissioning of numerous posts on the Alaska mainland and the reduction of personnel in others together with the cessation of military construction resulted in a sharp drop in economic activity.

The territorial legislature, which met in its seventeenth biennial assembly, passed a considerable body of constructive legislation, some of which had been sought for years. It responded to the rising sentiment for greater Territorial autonomy and self-government by adopting a memorial requesting Congress to grant statehood, and by providing a referendum on statehood for the next general election. It created an Alaska Development Board to meet postwar problems following the precedent established in the 48 States and Hawaii. It replaced the inadequate part-time Commissionership of Health with a full-time Commissioner of Health responsible to a board of five appointed by the Governor and increased the appropriation for tuberculosis care. It recognized the increasing importance of agriculture in Alaska by establishing a Department of Agriculture. It prepared to meet the acute housing shortage and to take advantage of Federal legislation by establishing a Housing Authority. It met the economic problem of two groups of Territorial residents by increasing the maximum old-age allowance from \$45 to \$60 monthly and by raising the salaries of territorial employees 15 percent, thus approaching, if not quite attaining, the Federal employees' 25 percent differential.

The territorial legislature strengthened the social security program by adopting a retirement act for the territorial school teachers and by extending coverage of the Unemployment Compensation Act. It eliminated one growing obstacle to progress by passing a land registration bill designed to remove the dead hand of vanished ownership from those who had patented lands of mining claims or who had left the Territory and could not be reached. It took epoch-making steps to place the Territory abreast of contemporary thought by outlawing discrimination based on race in public establishments, and likewise abolishing discriminations long existing and sanctioned by government practice and procedure in the Territory's juvenile code and in the law relating to dependent children. The results of this legislative session were extremely gratifying on the whole, indicating an increased awareness of the Territory's needs and its important destiny in the American Union.

Development Requires Federal Aid

Alaska's needs are great because of the Territory's large area, its inadequate communications, its relatively sparse and widely scattered population, when viewed in the light of anticipated migration to the area after the war. This prospective influx is of two kinds. It consists, first, of a great number of Americans, chiefly from the armed services, who hope to carve out a livelihood along America's last frontier. Second, a large number of Americans will want to travel to Alaska for their vacations.

Unfortunately Alaska is unprepared for both groups. For the first and more important category, since they aspire to be permanent residents, it is clear that at present roads, utilities of all kinds, housing, and economic opportunities are inadequate for any considerable number.

For highway construction, for the improvement of its health facilities, for the classification of lands, for the development of agriculture, and in countless other ways, Alaska needs Federal assistance which it has never enjoyed in sufficient measure. Alaska can probably do more than it has done in raising additional revenue for self-development, but the task of caring for a prospective citizenry larger than the existing population is clearly beyond the reach of the Territory with its small number of people and undeveloped resources. The development of Alaska—the farthest North and West continental territory of the United States and of great strategic importance, to make it available for successful settlement by returning non-Alaskan soldiers, sailors and marines, Wacs, Waves and Spars—the opening up of an area one-fifth as large as the 48 States, is a Federal responsibility and requires the prompt, generous, and intelligently directed support of both the Legislative and executive branches of the Federal Government. The prospective visit to Alaska during the summer of 1945 of several congressional committees should be a happy augury of the awakening of this interest on the part of national administration.

Influx of Travelers Expected

As for the second group of Americans, the numerous tourists who may spend their vacations in Alaska, it may be stated that they will find there sensational scenic beauty and wildlife abundance. However, accommodations are lacking to care for even a small fraction of those who will desire to go. They need to be developed jointly by Federal appropriations and private capital. The Federal Government has for years set aside vast areas as national parks and monuments in Alaska, withdrawing them thereby from other use, and as yet has made no appropriations for their development as it has for the national parks and monuments in the 48 States. Federal support is further warranted since the Alaskan economy hitherto has been

based almost entirely on industries—gold mining and salmon fisheries—and the tourist industry is clearly indicated as the single most important potential economic development. If the Federal Government does its part, private capital, both from outside Alaska, and within their means from Alaskans, may be expected to do its share in developing tourist business. Highway construction through Federal funds, of which the Territory has never had its fair share, essential also in this connection, is an excellent concomitant to every form of Alaskan development.

Alaska Road Commission

The Alaska Road Commission, which is responsible for the construction and maintenance of all roads and trails throughout the Territory except for roads in the national forests which are handled by the Public Roads Administration, carried out during the year the maximum reconstruction and maintenance program permitted by the funds available. No new highways were built. However, it reconstructed and maintained 2,700 miles of highways, 1,250 miles of sled roads and 4,000 miles of trails.

As the year ended, in conjunction with the Division it was working on a new program for road construction to be requested in its 1947 budget. Additional road construction is vital for some areas of the Territory to make additional lands accessible and to open markets. With prospective increased population, better transportation and communication must be made available.

Funds for the commission's program come from six sources: direct annual appropriations by Congress; reappropriation by Congress of a portion of the Alaska Fund, which is derived from Federal taxes upon the Territory's industries; appropriations by the territorial legislature; moneys allotted by the National Park Service; contributions by individuals, companies and corporations; and transfers from the War Department to cover cost of maintenance work on the Alaska highway.

Of these sources, the most important is direct appropriations by Congress and these must be augmented to make any extension of the program possible.

The Alaska Rural Rehabilitation Corporation

The fiscal year 1945 was a very successful one for the Matanuska Valley Farm Colony. Improvement in the methods of crop selection and marketing facilities is brought about as the farmers become better acquainted with Alaskan conditions. Gross business by the Matanuska Valley Farmers Cooperating Association in 1944 amounted to \$1,235,016.92 as compared to \$1,017,426 in 1943. Farm products sold through the cooperative increased from \$370,000 in 1943 to \$437,000 in 1944.

With revitalized interest on the part of the farmers and new personnel in the management of the Alaska Rural Rehabilitation Corporation and the Matanuska Valley Farmers Cooperating Association, the colony should continue to make consistent and satisfactory progress.

The Alaska Railroad

The Alaska Railroad's record of freight and passenger traffic in the fiscal year 1945 no longer recounts steeply rising volume. Rather, the changed war situation in Alaska has caused a reduction of military traffic in practically all areas served by the railroad. Net ton-miles of revenue freight carried were 21.5 percent less than the volume in 1944; however, the ton-miles were more than three and one-half times those in 1939, the last year before war activities affected rail traffic.

Gross operating revenues for 1945 were \$8,603,546.36 as compared with \$11,289,637.46 in 1944, a reduction of \$2,686,091.10, or 23.7 percent. The net income amounted to \$1,936,840.79 as compared with \$5,242,924.45 in 1944, a reduction of \$3,306,083.66, or 63 percent.

The total revenue freight hauled decreased from 627,847 tons in 1944 to 549,248 tons in 1945, a reduction of 78,599 tons, or 12.5 percent. Included in this year's tonnage were 225,887 tons of coal compared with 229,961 tons last year.

The total number of passengers carried was 88,998, an increase of 4,698, or 5.5 percent. Passenger-miles totaled 9,275,913, which was a reduction of 1,605,119 passenger-miles, or 14.7 percent under 1944.

Four river steamers were operated during the season of navigation on the Tanana and Yukon Rivers furnishing service between Nenana and Marshall. Tonnage handled amounted to 17,365 tons, an increase of 12 percent over the preceding year. The Nenana marine ways were enlarged to accommodate all of the floating equipment. A fuel-oil storage tank was installed at Nenana and a barge was converted into a fuel-supply barge.

HAWAII

The cost of the war to Hawaii in terms of expended resources, natural and human, recurring and nonrecurring, is literally incalculable. Its civilian population, swollen during 3½ years of war to a figure in excess of one-half million, cheerfully shared with uncounted thousands of service men and women accommodations and facilities for human subsistence which in other times would have been considered intolerable.

While the general health picture throughout the Territory improved during the year, work strain and congested living conditions undoubtedly contributed to the increased high death rate from tuberculosis. Marked progress on the Federal housing program during the latter part of the year promised to ease this situation.

Military Rule Ends

Although Hawaii's citizens, since the outbreak of war, had accepted with restraint and understanding a period of military rule unique in the history of the Nation, there was general satisfaction at the action of the late President in October 1944 by which the writ of habeas corpus was definitely restored, military authority over civilian activities was further limited, and the trial of civilians in military provost courts was discontinued. However, at the year's end, the 10 o'clock curfew was still in force and civilian mail continued to be subjected to military censorship.

In the Seventh War Loan drive, Hawaii again exceeded its quotas, leading the Nation in per capita sales.

Wartime Dislocations Acute

Increasingly acute adult manpower shortages, estimated at 15,000 for the island of Oahu alone, and nonavailability of heavy machinery for the extension of mechanization continued to handicap the production of sugar and pineapples. Since the start of the war, sugarcane land in cultivation declined almost 30,000 acres, or about 12 percent. About one-fourth of these lands was taken for Army and Navy purposes and the remainder was abandoned because of wartime production difficulties. However, the diligence of the producers and the strenuous efforts of Hawaii's school children combined to keep the percentage of decline in production at a low figure compared with the percentage of loss of lands and labor.

Hawaii's fishing industry was virtually eliminated by the war, although, during the latter part of the fiscal year, the efforts of the Territorial Board of Agriculture and Forestry to reestablish the industry were beginning to show results and it appeared that substantially increased quantities of fresh fish would soon be available to Hawaii's people.

Territorial tax realizations, internal revenue collections, gross postal receipts and bank clearings for the year reached an all-time high, although the increase in nontaxable Federal land holdings and continued declines in revenues from gasoline and motor-vehicle taxes were the cause of concern to the county governments which depend for support on these sources of revenue.

Labor and material shortages combined to delay progress on a number of projects vital to the territorial welfare but the past year saw the completion of a 100-bed addition to Queen's Hospital and a water development project, both of which were partially financed with Lanham Act funds.

Little Wagner Act

The regular biennial territorial and county elections which were conducted last year showed the largest vote in the Territory's history, indicating Hawaii's continuing interest in the processes of free democracy.

Hawaii's second wartime legislative session resulted in appropriations exceeding anticipated revenues by some \$19,000,000, indicating the probable necessity for extensive postwar readjustment of Hawaii's fiscal affairs. Much progressive legislation was enacted and approved by the Governor, including requirements for premarital physical examinations and vaccination and immunization against certain diseases, a "little Wagner Act" sponsored by labor, acts strengthening and broadening the scope of the child labor and workmen's compensation laws, acts increasing benefits under the unemployment compensation laws and establishing higher minimum wages throughout the Territory. A veterans' council was established and given a generous appropriation and provisions were made for substantial expansion of the facilities of the University of Hawaii and for improvement of the pupil-teacher ratio in the public schools. An airport zoning law was enacted and a commission was created to study the feasibility of establishing a territorial system of health insurance.

PUERTO RICO

Heading a list of legislative measures acted upon by the sixteenth Legislature at its first regular session, was Joint Resolution No. 1 requesting Congress to define the forms of political status "That Congress may be disposed to grant upon approval of any of them by the people of Puerto Rico." This resolution led to the Tydings-Piñero bill, introduced in Congress in May, which provides for a plebiscite on three forms of political status—*independence, statehood, and dominion.*

The Governor approved 328 bills passed by the legislature. Major appropriations included \$17,500,000 for the Development Company, \$15,000,000 for the Development Bank, and a total of \$11,232,000 for the Insular Emergency Council (principally for the relief program).

New agencies created included: (1) the Puerto Rico Agricultural Company to encourage the maximum development of the agricultural resources of Puerto Rico; (2) the Coffee Insurance Corporation of Puerto Rico in the Department of Agriculture and Commerce; (3) the Aqueduct and Sewer Service to handle all public aqueducts and sewers in Puerto Rico; (4) the Puerto Rico Labor Relations Board; (5) the Office of Information for Puerto Rico; and (6) an Office of Puerto in Washington.

Estimated total receipts from all sources for the fiscal year were 17 percent less than the previous year. The decrease from the total

receipts for the previous year was accounted for primarily by a sharp decline in rum exports which cut United States internal revenue collections returned to Puerto Rico.

Strike Delays Sugar Harvest

The sugar harvest was delayed over a month by an industry-wide strike early in the season. Nevertheless the sugar crop for the year ending June 30, 1945, was 886,100 tons, compared with 723,611 tons for the previous year. The grinding season is being extended through August by which time production for the crop year will probably total 960,000 tons. There was also an increase in the tobacco crop, from 285,000 quintals the previous year to a total of 400,000 for the current fiscal year.

The strike in the sugar industry, which lasted 36 days and involved 140,000 workers, was the most serious labor dispute of the year. It was adjusted when the Commodity Credit Corporation raised the sugar subsidy thus permitting employers to increase the wages of agricultural workers as well as those of mill workers.

The mediation and conciliation service of the insular department of labor disposed of 206 situations involving 353,510 workers, of which 54 ended in strikes involving 140,230 workers.

Birth Rate Increases

The war emergency program has carried on two major types of work relief projects: construction, employing an average of 23,812 persons; and community service, employing 7,800.

The increase in enrollment in all Puerto Rican schools, during the school year, was 25,777, or 7.82 percent. Total enrollment was 335,179. The university had 4,250 regular students enrolled.

The death rate showed a slight increase, from 14.7 per 1,000 to 14.8, while the birth rate rose from 39.6 to 41 per 1,000.

During 1944 the public welfare division provided financial assistance to 27,797 persons.

Civil Service Strengthened

The Civil Service Commission conducted a survey of the status of classified insular government employees and of personnel practices. Twelve thousand positions were described in job analysis sheets, duties and responsibilities analyzed, and the positions allocated to the classes established. A compensation plan was drafted which was enacted into law by the legislature and the salaries for all positions were fixed in accordance with the provisions of the compensation plan.

Industrialization Progresses

The Development Company's glass container plant began operations in January 1945, though work was temporarily interrupted by

a strike which occurred shortly thereafter. Substantial progress was made on other projects of the Development Company. A mill for the manufacture of pulp and paperboard was nearly completed. Contracts were approved covering machinery and engineering services to build a wallboard plant and a clay products plant. Pilot plants were established in textile design, basketry, furniture, and handiwork novelties. Studies were made of possibilities of establishing a cotton weaving and finishing plant, a shoe industry, and a meat-packing plant.

War's Impact Heavy

The war toll in Puerto Rico in terms of an upset economy and increased human suffering was demonstrably large, especially in the 18 months following Pearl Harbor. The curtailment of shipping in 1942-43 brought the island to the verge of collapse. The extent to which the process of strangulation progressed is illustrated by the fact that civilian tonnage reaching the island fell from a normal 100,000 tons in January 1942 to a little over 7,000 tons in September 1942.

Fortunately, September 1942 turned out to be the low point. In the following months shipping to the island was gradually increased until, by the late spring of 1943, it could be said definitely that the crisis had passed.

The shipping shortage had drastic, immediate, and long-term effects. Of the three principal food items—rice, beans, and codfish—codfish was unobtainable for a considerable period, supplies of rice were exhausted for several months, and beans, throughout, were very scarce.

On the industrial side, the disruption of shipping had an immediate and serious effect. Lacking space to bring bottles down and send bottled rum back, the rum industry faced complete stoppage for the duration. This was averted by the use of small boats. The volume of needlework fell off from a value of \$10,646,000 in 1941 to \$8,579,000 in 1943. Irregularity of schedules, as well as lack of space, caused continental operators to send their materials elsewhere for processing.

The long term effects of the shipping shortages were felt in agriculture—principally in sugar and tobacco. Both of these crops require large amounts of fertilizer, practically all of which is imported. Scarcity of fertilizer materials and lack of shipping space reduced fertilizer imports and the results in decreased sugar production came in succeeding years after the shipping problem had been solved.

The war brought a rapid increase in unemployment. With the liquidation of the Work Projects Administration in December 1943 the insular government was forced to assume responsibility for direct and work relief. Since then more than \$50,000,000 of insular money has been appropriated for this purpose.

THE VIRGIN ISLANDS

World War II demonstrated that the price which the United States paid for the Virgin Islands is more than adequately compensated by their strategic value in the defense arch protecting the Caribbean Sea approaches to the Panama Canal.

This year, as the war moved swiftly toward the end, Virgin Islanders turned their thoughts to the cushioning of their economy. Some of the effects of the temporarily disrupted harbor activities in St. Thomas were offset during the past 2 years by the suddenly expanded activities of the rum industry. Recently the harbor of Charlotte Amalie has begun to show signs of a recurrence of its once healthy activity as neutral ships again are permitted to call here for bunkering.

Transportation to the islands was improved when a Puerto Rican airline, servicing the Virgin Islands and Puerto Rico, leased the new, modern, and fast air equipment of one of the large national airlines, and when an American airline recently extended daily air service from the mainland to St. Thomas.

St. Croix this year produced 4,040 tons of raw sugar while 3,200 tons of cane were processed for rum. The Virgin Islands Co., operating St. Croix's only sugar mill and one of its two distilleries, continues to be the substance as well as the nucleus of the island's economic life.

Islands Look to Public Works

The postwar program for the Virgin Islands has centered around the projected construction by the Federal Works Agency of public works, health and sanitation facilities for which Congress, by Public Law 510; approved December 20, 1944, authorized appropriations totaling 10 million dollars. An initial appropriation was made for plans and specifications and it is hoped that an appropriation of the first 2 million dollars will be made within the next few months, permitting construction to begin early in 1946.

Birth Rate Highest On Record

This year the general health of the islands has been good and epidemics have been scarce. The birth rate for the calendar year 1944 was 43.4, the highest on record; the death rate was 16.3, a slight increase over the preceding year, but still lower than in any previous recorded year, and the infant mortality rate was 101.2, higher than in the preceding year.

Finances and Services Improved

The economic and financial trends indicate an inevitable decline from the prosperity in both islands in the fiscal year under review. The revenues of the municipality of St. Thomas and St. John were

\$1,257,416.53, a decrease of 22.27 percent. In St. Croix, the revenues were \$515,383.28, an increase of 96.20 percent over the preceding year, the largest revenue in its history, due directly to the rum profits of the Virgin Islands Co. As a result, long-neglected municipal services were improved. Prospects of revenues, for the coming fiscal year, however, are not bright in St. Thomas and St. John, and St. Croix faces an acute situation.

The department of social welfare in St. Croix distributed minimum monthly grants of \$2.50 to more than 400 indigents. These grants were once as low as \$1. In St. Thomas comparable grants of \$5 were made to a like number of indigents. There was considerable improvement in the social services, especially in child-welfare work. Unemployment in both islands was relieved in great measure by local public works appropriations.

By June 30, 1945, there were 688 inductees from the Virgin Islands in the armed forces. In most instances, their military pay plus allowances to dependents exceeded previous family incomes.

Increased Self-Government Recommended

A definite policy on political status should be developed for the islands. Every effort must be concentrated on helping the islanders develop the governmental techniques which will enable them to assume increasing responsibility in the management of their local affairs and in helping them increase their economic self-sufficiency. In addition to the Department of the Interior's policy of employing qualified local persons whenever they are available for Federal positions in the islands, certain features of the Organic Act should be amended. Suggestions for such amendments are now being drafted by a local committee.

THE PHILIPPINE ISLANDS

Following the American landings in the Philippines, the highest officials of the Japanese-sponsored puppet government were transferred from Manila to Baguio. Most of these men were captured and are now held in the custody of the United States Army pending trial after the war by the Commonwealth Government on charges of collaboration with the enemy. Three of these officials escaped in Japanese planes to Tokyo—José P. Laurel, the so-called President of the puppet Republic; Camilo Osias, Secretary of Education and ex officio President of the Kalibapi (the Japanese sponsored Fascist Party), and Benigno S. Aquino, Director-General of the Kalibapi and Speaker of the puppet National Assembly. Manuel A. Roxas, recently chosen President of the Commonwealth Senate, who had also been transferred to Baguio, was released from custody by the military authorities as an unwilling office holder whose loyalty to

the Philippines and to the United States had been thoroughly established.

While the great mass of Filipinos have heroically resisted the Japanese during the occupation, it is a matter of concern to the United States that those individuals who have taken leading parts in the puppet regime are for the most part men who were formerly high in the councils of the prewar Philippine Government. On this subject the late President Roosevelt stated on June 29, 1944, that "those who have collaborated with the enemy must be removed from authority and influence over the political and economic life of the country."

After the recapture of Manila in February 1945, General MacArthur formally restored to the Commonwealth Government "full powers and responsibility." Immediately President Sergio Osmeña set about reestablishing the executive and administrative functioning of the national government. He did not call into session the legislative branch, which was involved in an extraordinary situation, until June 9, 1945, after his return from an urgent trip to the United States.

The possible political implications of the status of the present Philippine Legislature are obvious and, in the light of President Roosevelt's statement, of deep concern to the United States. On June 9, 1945, when the special session convened, only 13 were available in the entire Senate; and of the 24 original members, all but 17 are known to have been connected in some capacity with the puppet regimes. If conditions in the Philippines, however, are stable enough to hold the election planned for November 1945, the Filipino people will have an opportunity to choose a legislature to its liking with the possible exception of the third of the Senate allocated 6-year terms.

Occupation Leaves Problems

In view of the imminence of independence and the economic and financial bankruptcy of the Philippines, the United States Government is deeply involved in the future welfare of the Islands. American reoccupation has found the sugar industry paralyzed, many mills destroyed or damaged, hardly more standing cane in the fields than should be saved for seed, and with less than half of the necessary work animals surviving. Members of the industry estimate that before the war sugar supported, directly or indirectly, about 4 million of the Islands' 17 to 18 million population. Reconstruction of this industry is largely dependent on American decisions as to future trade preferences and war damage compensation.

The Japanese occupation has saddled the Commonwealth with a mass of currency problems. The Japanese had put into circulation some 40,000,000 pesos (\$20,000,000) in Philippine bank notes previously redeemed by the Commonwealth, which they found in the

vaults of the treasury, and against which there is no reserve. An unknown quantity of treasury warrants had been issued in the name of the Commonwealth by the puppet government. After the fall of Manila, President Quezon had authorized branches of the Philippine National Bank in areas not yet occupied to issue emergency notes and Emergency Currency Boards had been empowered to issue local currencies up to the amounts of unencumbered provincial balances in the bank. As the occupation period stretched out and the need of funds grew, various units of the resistance forces issued scrip under their own civil affairs administrations. There are unknown quantities of the old prewar peso still in circulation and, added to these various currencies for which the Commonwealth has more or less responsibility, the American armed forces brought with them the new victory peso with which it pays United States troops, Filipino labor, etc.

The end of the occupation period also found the Islands flooded with Japanese pesos and suffering violent inflation. Although these notes were declared null and void upon the return of Commonwealth authority, the great increase in other currencies remaining in circulation—augmented by heavy expenditures of American forces—has combined with the dire scarcity of food, clothing, and the essentials of daily living to sustain inflation and a widespread black market.

The foregoing are illustrations of but a few of the many critical problems with which the Filipino and American people are faced as a result of the war. Statesmanship of a high order on both sides will be required to solve them.

THE EQUATORIAL ISLANDS

Although war in the Pacific terminated the Division's field development project on the islands of Baker, Howland, and Jarvis in the equatorial group, the use to which the islands were put by the United States armed services proved conclusively the value of such pioneering work. Early in the war the air strip which had been built on the island of Howland for a possible emergency landing by Amelia Earhart was destroyed by the Japanese. The Army moved into Baker in force in 1943 and constructed a Marston Mat air strip. The installations on Jarvis were rendered useless by a United States destroyer in order to prevent their possible utilization by Japanese forces.

The islands of Canton and Enderbury, which the United States holds in condominium with Great Britain, also played an important part in the war. At Canton the air facilities were greatly expanded and the island will undoubtedly remain an important link in trans-Pacific air routes.

Puerto Rico Reconstruction Administration

BENJAMIN W. THORON, *Administrator*¹

THE Puerto Rico Reconstruction Administration was established by Executive Order No. 7057 of May 28, 1935, to "initiate, formulate, administer, and supervise a program of approved projects for providing relief and work relief and for increasing employment within Puerto Rico." President Roosevelt emphasized that the main objective of the program should be permanent reconstruction of the island's economy in terms of agricultural rehabilitation, rather than mere temporary palliative relief. For this purpose funds aggregating approximately \$70,000,000 were made available to the Puerto Rico Reconstruction Administration by allotments from appropriations contained in the Emergency Relief Appropriation Act of 1935 and later relief acts, and by direct appropriations for the Puerto Rico Reconstruction Administration through the fiscal year 1941. Thereafter financing has been exclusively through funds allotted by the President out of the Puerto Rico revolving fund. That fund created by the act of February 11, 1936, consists of income and the proceeds of the disposition of property derived entirely from the Puerto Rico Reconstruction Administration's operation of projects which were financed with funds originating in the Emergency Relief Appropriation Act of 1935. The advent of the Work Projects Administration in the island, large expenditures for defense and war activities, and assumption by the insular government of much of the responsibility for the employment relief had removed the necessity for large expenditures by the Puerto Rico Reconstruction Administration which existed when it was the only agency equipped to alleviate the ever present unemployment problem. Accordingly the comparatively small amounts which have been available to the Puerto Rico Reconstruction Administration each year since 1942 out of the revolving fund have necessarily limited the Puerto Rico Reconstruction Administration's activities principally to protection of investments previously made, and to conservation of the most essential features of its former broad program of rural rehabilitation.

¹ Resigned effective June 30, 1945, and was succeeded by Edwin G. Arnold.

Expenditures during the fiscal year 1945 out of the Puerto Rico revolving fund were authorized by the President for the following projects:

Operation and maintenance of housing projects.....	\$225, 000
Management of lands and leases connected with the Lafayette project.....	68, 000
Operation of Castaner farm project.....	56, 500
Supervision of and making and servicing of loans to co-operatives.....	97, 000
General administration.....	160, 000
Construction of rural houses, etc.....	400, 000
Operation of Central Service Farms.....	150, 000
Subdivision and sale of lands in Lafayette district for food crop production.....	13, 000
Purchase of 5 small parcels of land in San Sebastian.....	324
Storm-water sewer and drainage at the Eleanor Roosevelt development.....	20, 500
Total.....	1,190,324

A summary of the year's principal activities, differing little in essential features from those of the preceding 3 years, follows:

HOUSING MANAGEMENT

Rental collections amounted in round figures to \$343,000 as against the outlays authorized for management and maintenance of \$225,000. This income came from the Puerto Rico Reconstruction Administration's 1,210 urban family dwelling units, nominal rentals from 4,610 rural parcels of about 3 acres each on which no houses have been built, 6,254 rural houses built in previous years, and 235 additional rural houses constructed during the year. Transportation and shipping difficulties in procuring some needed materials prevented completion of all of the houses planned, but the 235 constructed added 700 acres of formerly unproductive land to the raising of subsistence crops by resettled farm laborers as a supplement to their meagre work earnings. All of the urban houses and 98.6 percent of the rural homesteads were occupied as of June 30, 1945. Under the policy of encouraging tenants to become owners, 312 occupancy agreements in the urban zone and 4,526 in the rural districts had been converted by June 30, 1945, into long term purchase agreements. Final conveyances of 40 parcels without houses and of 5 rural homesteads were executed.

RURAL REHABILITATION

Like the 6,489 rural houses and their adjacent parcels devoted to the cultivation of minor food crops, the Central Service Farms project is a most important part of the Puerto Rico Reconstruction Administration's continuing rural rehabilitation program. The insular government through its war emergency program added \$42,132.86 to the

\$150,000 in Federal funds provided for this project. This made it possible to increase the food supply and the income of the island by the planting of approximately 16,000 acres in subsistence crops and 3,500 acres in cash crops on lands of the Federal Government occupied by the Puerto Rico Reconstruction Administration resettlers. Agronomists gave the resettlers constant advice and supervision in the cultivation, harvesting and marketing of these crops. Seeds produced on 322 acres of beds in the seven Central Service Farms and fertilizers and insecticides were distributed to needy resettlers. These resettlers were not paid for labor on their own parcels, but were paid for work performed in cultivation of the Central Service Farms proper, for the repair and maintenance of intra-farm roads, and for labor in operating and maintaining the Puerto Rico Reconstruction Administration's 37 rural waterworks systems which supply potable water gratis to rural dwellers.

The Castaner project, undertaken several years ago to demonstrate that a large coffee plantation can be made self-sustaining by proper land utilization, soil conservation and crop diversification produced \$56,750.94 from the sale of citron, vanilla, coffee, sugarcane, and various minor crops, while furnishing employment to members of more than 200 rural families resettled on one- and two-acre subsistence parcels. In addition to the two 30-bed rural hospitals mentioned in last year's report as established at the Puerto Rico Reconstruction Administration's Castaner and La Plata projects by the National Service Board for Religious Objectors, health units have been opened and are being operated to serve the residents of the Puerto Rico Reconstruction Administration's rural rehabilitation projects in the Zaldondo, San Just, and Comerio areas. Under technical supervision of the planning and direction of the work program by the Puerto Rico Reconstruction Administration as authorized by the Director of Selective Service, these adjuncts of the civilian public service camps are providing invaluable health service to thousands of Puerto Rican rural dwellers for whom such facilities were never before available.

COOPERATIVES

Special attention was given to the cooperatives financed by the Puerto Rico Reconstruction Administration which are engaged in the marketing of produce and the production of commodities for war needs. The Lafayette Sugar Mill Cooperative processed 207,000 tons of cane as compared with 179,000 tons the previous year, and sold all sugar produced to the Commodity Credit Corporation. In its subsidiary solvents plant over 5,000,000 pounds of butyl alcohol and acetone under War Production Board allocations was sold for lend-lease and other war requirements. Interest due June 30, 1945, on the Puerto Rico Reconstruction Administration loan of approximately

\$3,037,450 was paid in advance, and shortly after the end of the fiscal year the cooperative paid \$250,000 on principal, although no amortization installments are due until June 1947. However, due to the termination of lend-lease and the uncertain postwar commercial demand for the plant's butyl alcohol and acetone, their production has been stopped and plans for conversion of the plant to the manufacture of industrial alcohol are under consideration. The Los Canos Sugar Mill Cooperative processed approximately 200,000 tons of cane, paid interest accrued and \$54,000 of its principal debt to the Puerto Rico Reconstruction Administration under a refinancing arrangement, with the balance of \$936,000 payable in annual amortization installments of approximately \$50,000 including interest beginning June 30, 1946. Five vegetable-marketing cooperatives previously organized and financed by Puerto Rico Reconstruction Administration increased their volume of business to approximately \$500,000 from \$300,000 for the fiscal year 1944 and \$100,000 for the fiscal year 1943. All met installment obligations to the Puerto Rico Reconstruction Administration on time and one paid 4 years in advance. Two additional vegetable marketing cooperatives, one at Corozal and the other at Barranquitas were organized and financed with Puerto Rico Reconstruction Administration loans totaling \$29,000. The Cotton Growers Cooperative Association, to which at one time loans aggregating \$125,000 had been made, reduced its existing \$63,750 loan to \$30,000, having sold 1,756,466 pounds of Sea Island cotton during the fiscal year. The Sociedad Agricola which purchases farm supplies for members and patrons, sold approximately \$762,000 of fertilizer, feeds, etc. An additional loan of \$20,000 was made to the Puerto Rico Rug Cooperative, composed of rural dwellers, and which had a record volume of business amounting to over \$122,000. The cooperative organized and financed the previous year and known as the "Cooperativa de Cosecheros de Cidra", processed approximately 1,100,000 pounds of citron during the fiscal year, representing about one-fourth of the island's total production of a product for which previously there was little encouragement. The accounting and operations of all of these cooperatives sponsored and financed by the Puerto Rico Reconstruction Administration are under its constant supervision.

CONCLUSION

For the continuation during the fiscal year 1946 of projects similar to those above reported, the President has authorized the Puerto Rico Reconstruction Administration to expend approximately \$950,000 out of the Puerto Rico revolving fund. On June 30, 1945, the unobligated balance in this fund was approximately \$2,650,000. Anticipated deposits to the revolving fund during the fiscal year

1946 and succeeding years in proceeds derived from projects financed with what were originally 1935 funds, will be somewhat less than the amounts required each year to continue the Puerto Rico Reconstruction Administration's present limited program. Accordingly in a few years the revolving fund will be so depleted that some other source must be found for conserving the social and economic benefits which would be lost if the program were entirely terminated. It is unquestionably true that large expenditures either of insular or Federal funds must be made for many years to come if the permanent reconstruction of the island's distressed economy which President Roosevelt set as a fundamental objective is to be accomplished.

War Relocation Authority

DILLON S. MYER, *Director*

THE most important turning point in the comparatively short history of the War Relocation Authority program came toward the end of 1944. On December 17 the War Department announced the revocation of the mass exclusion orders under which it had evacuated all persons of Japanese descent from the West coast area in 1942 and through which it had prohibited their return to that area (except under special military permit) for almost 3 years. Basing its action primarily on the satisfactory progress of the war in the Pacific, the War Department immediately replaced the wholesale exclusion with a greatly modified system of control under which it continued to exclude only those individuals of Japanese descent whose personal records appeared to warrant such restriction. The revocation, designated to take effect on January 2, ended the wartime ejection of the great majority of West coast Japanese from their former homes and marked the beginning of the end of the War Relocation Authority program.

The War Relocation Authority which had been maintaining relocation centers as temporary shelters for the evacuated people and meanwhile helping as many as possible to become reestablished in normal communities outside the western exclusion zone, immediately took steps to realign its basic operations. First, it broadened the scope of its resettlement activities to take in the former evacuated area and thus cover the entire United States. Second, it made plans to speed relocation movement from the centers in order to close all centers except Tule Lake within 6 to 12 months. Third, it abandoned all processing of evacuee records for leave clearance and abolished its leave regulations, with the result that all center residents, except those specifically designated for detention by the War Department or the Department of Justice, were free to leave the centers at any time.

With these changes, the Authority was ready for the first time to move definitely toward ultimate liquidation of all its operations. When the revocation order took effect on January 2, there were slightly over 80,000 persons of Japanese descent still residing in the

9 War Relocation Authority centers, including the Tule Lake Segregation Center of northern California. Over 35,000—or nearly one-third of the total group that had come under War Relocation Authority's custodianship—had left the centers over a period of more than 2 years to take up residence in cities and towns all the way from Spokane, Wash. to Boston, Mass. Of the 80,000 who still remained, the War Relocation Authority calculated that approximately 20,000, consisting mainly of Tule Lake residents, would be either personally designated for detention by the War and Justice Departments or members of the detainees' immediate families. This left a total of 60,000 who had to be assisted in making the transition back to private life before the end of December 1945. Thus the War Relocation Authority was faced on January 2 with the task of completing in 1 year almost twice the volume of relocation which it had managed over the preceding 2-year period.

Several factors, however, tended to reduce the magnitude and complexity of the job. Aside from the skill which War Relocation Authority personnel had gradually gained in relocation after 2 years of intensive experience, there was the overwhelming fact of the Army's revocation order. No longer was it necessary for the average center resident to choose between remaining in the restrictive environment of a center and striking out into an unfamiliar section of the country; the great majority were now free, if they wished, to return to their former homes. Moreover, public acceptance for people of Japanese descent through the country was probably at an all-time high. The remarkable exploits of Japanese American soldiers in every major theater of war—and particularly on the Italian front—had effectively exploded the old cliché that no persons of Japanese ancestry can possibly be loyal to the United States. The excellent work record and exemplary civic behavior of nearly all resettlers from the centers had served further to dispel previous fears and antagonisms. With employment opportunities still running high and with citizen groups (as well as previous resettlers) working to help relocation in almost every major city of the Nation, the stage was set for a record movement out of War Relocation Authority centers and completion of the assignment within the scheduled time.

In order to prepare for a greatly enlarged volume of relocation and a rapidly dwindling center population, the War Relocation Authority on the day after the revocation announcement revised somewhat drastically its whole program of center operations. All activities except those which were absolutely essential and those which contributed toward relocation were scheduled for termination at the earliest feasible date. Construction was brought virtually to a standstill and even maintenance work was sharply curtailed. Crop production on the agricultural lands of the centers was eliminated

entirely except for completion of the winter vegetable program at the two centers in Arizona. All further purchase of livestock was halted and plans were made for full utilization of existing flocks and herds. Announcement was made that center schools would close permanently in June at the end of the academic year. Cooperative business enterprises, operated by the evacuee residents, were advised to start planning at once for eventual liquidation. By the end of June practically all of these changes had either been achieved or were well on the way to realization.

In submitting budget estimates to the Bureau of the Budget and the Congress shortly after announcement of the West coast revocation, the War Relocation Authority forecast that 16,000 of the 60,000 "relocatable" persons who could be relocated and who were residing in centers on January 2 would leave before the end of June. The actual number who relocated during that period was 15,907. Of this number, 4,922 returned to the evacuated zone while the remainder—many of them dependent family members following their previously relocated breadwinners—chose to resettle in other parts of the Nation. When the fiscal year ended, the total number of relocations for the preceding 12 months stood at 24,679 and the cumulative total covering the entire period since establishment of the War Relocation Authority program was 51,412. Of the 44,000 "relocatables" still residing in centers, it was anticipated that fully half would ultimately return to their communities of prewar residence in the far Western States.

RESETTLEMENT ACTIVITIES

Field Organization

One of the first steps which the War Relocation Authority took after revocation of the exclusion orders was to set up a field organization in the West Coast States similar to that which had previously been functioning throughout the rest of the country. Dividing the coastal region into three broad areas—northern California, southern California, and the northwest—the Authority established its principal field offices at San Francisco, Los Angeles, and Seattle. District offices, to handle relocation problems at the local level, were also created in these three cities as well as in 15 others such as Fresno, Santa Barbara, Sacramento, and Portland. Meanwhile the activities of field offices in several other sections of the country were slightly curtailed and four of these offices were discontinued.

Public Acceptance

Except in some parts of the Pacific coastal area, public acceptance of relocating evacuees was not a major problem of the War Relocation Authority during the fiscal year. Of the nearly 20,000 evacuees

who left relocation centers for destinations outside the former exclusion zone, less than a dozen reported any serious difficulties of community adjustment, and all of these cases were eventually worked out satisfactorily.

In many communities of California, Washington, and Oregon, however, hostility toward the evacuated people and opposition to their return assumed serious and rather widespread proportions. This was particularly true in the interior agricultural valleys of all three States and in some rural sections along the California coast; acceptance in the major coastal cities, aside from some attempts at boycott of evacuee crops in the produce markets, was generally good throughout the entire period.

After revocation of the exclusion ban, antievacuee feelings, which had been simmering throughout the fall, suddenly erupted simultaneously at several places in the coastal States. At first they took the comparatively harmless (but nonetheless reprehensible) form of hostile "mass" meetings, resolutions adopted by various organizations opposing return "at least until after the war," discriminatory signs posted in shop windows, formation of new citizens' leagues specifically for the purpose of working against return, and unfriendly editorials or paid advertisements in the local newspapers.

In the Northwestern States resistance to the return of the evacuees was very largely confined throughout the whole period to these and similar "within the law" types of discrimination. But in several of the California localities, as the evacuee continued to come back in increasing numbers despite such menacing gestures, the hoodlum element among the opposition began resorting to attempted violence and open intimidation.

By the end of June 34 such incidents—involving attempted arson or dynamiting, shots fired into the homes of returned Japanese, and threats of bodily harm—were recorded. The worst spots were Merced and Fresno Counties, with seven shootings each; Orange County, which had six cases of intimidation; and Placer County, which had an attempted arson and dynamiting coupled with a shooting. Fortunately, no evacuee was actually injured in these lawless forays. Property damage, however, was considerable, and the terrorism which prevailed over wide areas of California undoubtedly contributed to the relatively slow rate of return to that State during the first 6 months after revocation of exclusion.

To counteract unreasoning prejudices against all persons of Japanese descent and correct the factual distortions about War Relocation Authority activities which had been disseminated by hostile West coast organizations and newspapers, the Authority undertook a positive program of public information in the far western area several months before revocation of exclusion. Working mainly through and

in cooperation with civic clubs, church groups, and similar organizations, War Relocation Authority field officers tried to reach as many people as possible with factual information about the agency's aims and procedures, the status and experiences of the evacuated people since evacuation, and especially the combat record of Japanese American soldiers. Pamphlets and bulletins, setting forth such information, were made available to groups and individuals upon request; explanatory talks were given before dozens of local forums and organizational meetings; motion pictures, dealing with the relocation program, and the Japanese American soldier, were shown; progress reports and other types of information were released to the press.

In this effort, information about American servicemen of Japanese descent proved particularly effective. The almost unparalleled combat record of the all-Nisei One-hundredth Infantry Battalion and Four Hundred Forty-second Regimental Combat Team, the long list of Nisei casualties, and the impressive array of their battle decorations brought home more forcibly than anything else the fact that Japanese Americans are capable of the highest kind of loyalty to the United States and that the families in relocation centers have sacrificed equally with other American families in the winning of the war.

When the pattern of terrorism in California became plainly apparent toward the end of March, a definite system of reporting incidents to the State and local law enforcement officials and to the press, both locally and nationally, was instituted. On May 14, the Secretary of the Interior finally issued a strongly worded public statement condemning the terroristic elements and calling for more vigorous local law enforcement. Approximately 2 weeks later the Secretary took occasion at a press conference to denounce a California justice of the peace who had suspended sentence upon a man convicted of shooting into the home of a returned evacuee. By these means, the public both on the West coast and throughout the Nation was made gradually aware of the insidious manifestations of racial prejudice in California and of the less violent forms of opposition both there and in the Northwestern States. Before the end of June scores of newspapers in all sections of the country had brought the issue of West coast terrorism sharply into focus and had aroused a widespread demand that the returning evacuees be accorded fair and decent treatment.

As the period ended, there were encouraging signs that this heightened public awareness of the issue was having a salutary effect. The tone adopted by many of the opposition groups was becoming progressively milder and more defensive, while several organizations of West coast citizens friendly to the evacuees were growing increasingly active and outspoken. Most significant of all perhaps, the incidents

who left relocation centers for destinations outside the former exclusion zone, less than a dozen reported any serious difficulties of community adjustment, and all of these cases were eventually worked out satisfactorily.

When the pattern of terrorism in California became plainly apparent toward the end of March, a definite system of reporting incidents to the State and local law enforcement officials and to the press, both locally and nationally, was instituted. On May 14, the Secretary of the Interior finally issued a strongly worded public statement condemning the terroristic elements and calling for more vigorous local law enforcement. Approximately 2 weeks later the Secretary took occasion at a press conference to denounce a California justice of the peace who had suspended sentence upon a man convicted of shooting into the home of a returned evacuee. By these means, the public both on the West coast and throughout the Nation was made gradually aware of the insidious manifestations of racial prejudice in California and of the less violent forms of opposition both there and in the Northwestern States. Before the end of June scores of newspapers in all sections of the country had brought the issue of West coast terrorism sharply into focus and had aroused a widespread demand that the returning evacuees be accorded fair and decent treatment.

As the period ended, there were encouraging signs that this heightened public awareness of the issue was having a salutary effect. The tone adopted by many of the opposition groups was becoming progressively milder and more defensive, while several organizations of West coast citizens friendly to the evacuees were growing increasingly active and outspoken. Most significant of all perhaps, the incidents

of terrorism dwindled sharply, both in frequency and violence almost immediately after the Secretary's two public statements. In fact, there was no incident of major importance between the Secretary's second statement and the end of the fiscal year.

Financial Assistance for Resettlers

On the day after announcement of revocation the War Relocation Authority sent to all evacuees, both in and out of centers, a comprehensive statement on the types of assistance that would be available thereafter for relocating families and individuals. Travel and transportation of personal properties, which had previously been extended only on a showing of need, were made available generally to all persons leaving the centers for relocation. Such assistance was also extended to those who had previously relocated outside the West coast area and who now wished to go back to their States of former residence. Additional grants, to cover the cost of subsistence while traveling as well as expenses during the transition period immediately after arrival at destination, were continued for those persons in actual need of such supplemental help.

At each center, however, there was a group of people who required assistance over and above these types of aid in order to become satisfactorily reestablished in private life. This group included those whose family resources had been seriously depleted as a result of evacuation, unattached individuals who were incapable of obtaining self-support, and families without any prospect of adequate continuing income. Early in the relocation program, the War Relocation Authority completed an agreement with the Social Security Board in cooperation on a program of financial assistance specifically designed to meet the needs of such people as well as those resettlers who might be faced with a sudden, unpredictable, short-range need for help. This program, actually administered by State and local public welfare agencies, was financed by funds made available to the Social Security Board by the War Relocation Authority.

Before revocation of exclusion, there were comparatively few applicants for assistance under this program among the relocating evacuees. As the more able-bodied, primary wage-earners left the centers in increasing numbers during 1943 and 1944, however, the so-called "dependency" cases loomed steadily larger in the residual population. Accordingly, when the ban was lifted and plans for closing centers were announced, the War Relocation Authority began almost immediately to intensify and broaden the arrangements which had previously been made for handling dependency cases. Since most of the dependent evacuees could qualify for continuing public assistance only in their States of former residence, first attention was given to working out a satisfactory referral procedure with State and local

welfare agencies of the former evacuated area. At the centers staffs of trained welfare workers were geared up to the job of interviewing all families and individuals who had special problems of support, analysing their needs, and advising them of the types of assistance for which they might be eligible. Case summaries prepared at the centers were transmitted through the War Relocation Authority field offices to the State and ultimately the local welfare agencies.

Although the procedure for handling dependency cases was somewhat slow and cumbersome at first, it was streamlined and speeded up considerably throughout the spring. By the end of June, most of the delays had been eliminated, and the War Relocation Authority was able to plan for the final closing of the centers with full assurance that no genuinely needy person would be left without adequate means of support.

Employment and Housing

Because of the widespread need for workers of nearly all types, relocating evacuees experienced comparatively little difficulty during the year in finding job opportunities consistent with their individual qualifications. The problem lay, rather, in finding enough evacuees to fill the jobs which were available.

On the West coast, however, the resettlers enjoyed somewhat less freedom of job selection than in other sections of the country. Governmental regulations continued to debar the evacuees from employment in coastal fishing or waterfront work, while one of the more important labor organizations of the region—the International Teamsters Union—adopted a policy of categorically excluding from membership all persons of Japanese descent except honorably discharged veterans. In a few cases individual labor union members resisted working on the same jobs or in the same shops with the returnees and even threatened to strike if the Japanese Americans were hired.

The most noteworthy case of this kind occurred in May at Stockton, Calif., where some members of the International Longshoremen's and Warehousemen's Union attempted to foment a strike in protest against the employment of three returned evacuees. This action was promptly repudiated as contrary to the union's policy both by the international president and by the head of the San Francisco local which had jurisdiction over the Stockton unit. The protesting members were swiftly suspended from membership and were told that the union would tolerate no racial discrimination. A strike was effectively averted and the evacuees continued on the job.

Housing was a problem for resettlers in practically all of the Nation's largest cities and was particularly acute in the metropolitan centers along the Pacific coast. Shortly after the opening of the West coast field offices, intensive efforts were made to encourage the estab-

lishment of evacuee hostels in that region similar to those which had previously been operating in other sections of the country. These hostels, usually operated by church groups or other organizations interested in assisting Japanese American relocation, were designed to provide temporary accommodations for resettlers until a more permanent type of housing could be located. Before the fiscal year ended, about a dozen had been set up in principal West coast cities. The War Relocation Authority actively assisted in their establishment by making surplus relocation center equipment—such as bedding, cooking utensils, and the like—available to the sponsors on a loan basis.

Both on the West coast and elsewhere the Authority assigned staff members at its principal field offices to work full time in helping resettlers to locate housing accommodations and marshalled every available resource to overcome this particular problem. By the end of June substantial progress had been made toward the ultimate goal of assuring at least temporary accommodations for every individual and every family group leaving the relocation centers.

CENTER MANAGEMENT

The job of operating emergency-built cities for displaced persons of Japanese descent has never been more than a temporary expedient in the War Relocation Authority program. From the time when the long-range policies of the agency were first formulated in the summer of 1942, the Authority has always looked forward to the day when the evacuation orders would be rescinded and the shelter of the centers would no longer be required. The War Department's announcement of December 17, restoring freedom of movement throughout the United States to the great majority of the evacuees, eliminated in one stroke the center's chief reason for continued existence.

The revocation order did not, however, automatically transport the thousands of center residents to their chosen destinations, and it did not solve overnight all the manifold problems involved in dissolving these complex wartime communities. In order to prevent a chaotic mass movement and allow for individualized relocation planning and assistance, a spaced-out program of center closing was obviously essential. After careful consideration of factors such as transportation, available housing, and employment opportunities, the Authority decided that no center could be closed on a sound basis in less than 6 months but that all (except Tule Lake) should be closed within a year.

Because of the greatly increased emphasis on relocation preparations and the need to keep center management problems at a minimum, a policy was adopted immediately after revocation governing visits that might be made back to the centers by previously relocated

evacuees. At first, such visits were permitted only for purposes of completing family relocation plans or for emergency purposes and only with the advance approval of the appropriate War Relocation Authority field office. Later the advance approval requirement was eliminated, and each relocated evacuee was permitted a maximum of 30 days for visiting at the centers without regard to the purpose of the visit.

By the end of June all phases of center operations were well advanced toward final liquidation. Although there were still about 44,000 people to relocate and large amounts of Government property which eventually would have to be inventoried and processed through surplus property channels, the War Relocation Authority had every reason to believe that all centers could be closed by December and was contemplating the definite possibility of closing some at an even earlier date.

Construction and Maintenance

Revocation of the exclusion order brought immediate reduction of the construction and maintenance operations to a minimum, in all centers except Tule Lake, where it was necessary to complete a considerable program of buildings already under construction or planned. Likewise maintenance was pared down to the minimum consistent with efficient operation. By the use of lumber and other materials released through cancellation of many center construction projects, sufficient stock was available for all construction and maintenance, and the building of boxes and crates for the freight of relocating evacuees, without ordering new stocks. This was made more effective by the interchange of materials between the different centers.

Agriculture

During the first half of the fiscal year the agricultural program was in full operation, in accordance with the policy of producing as much of the food needed for the evacuees as possible. But with announcement of the closing date for the eight relocation centers an almost complete reversal was made. No crops were planted in the spring of 1945 with the exception of Poston and Gila, where vegetables could mature and be harvested by June 30. No additional beef cattle or poultry were purchased and the hog breeding program was discontinued. A program for the orderly fattening and slaughtering of the livestock on hand was put into effect. By the close of the fiscal year most of the livestock at the centers had been consumed.

Community Government

Sponsored by the Community Councils of seven centers, an all-center evacuee conference was held in Salt Lake City in February.

Approximately 30 delegates met for a week, discussing problems affecting the evacuees as a result of the opening of the West coast and announcement of center closure. The delegates prepared and approved a letter to the Director of the Authority requesting reconsideration of center closing and submitted a list of recommendations to facilitate resettlement and rehabilitation of those relocating. Although the Authority did not modify its policy on center closing, it gave careful consideration to the other recommendations of the conferees and instituted a number of procedural changes along the lines recommended.

Felonies, misdemeanors, and violations of administrative regulations decreased in all centers, and the general crime rate was small, compared with national rates.

Business Enterprises

Evacuee-operated business enterprises in the centers generally were in excellent financial condition at the close of the fiscal year, with assets on May 31, listed at \$1,237,369, or 16 percent lower than 1 year previously. Inventories were reduced during the fiscal year from \$872,000 to \$429,000 and the cash balance increased from \$441,000 to \$666,000.

Education

With the end of a vigorous 3-year school program in the centers set to coincide approximately with the close of the fiscal year considerable readjusting was necessary. School enrollment on the elementary, secondary and nursery school levels showed a drop of 2,780 during the year. The elementary and secondary enrollment at the beginning of the year was 18,772, and at the end of the year 16,399. The nursery school enrollment dropped from 1,928 to 1,521. A major part of these declines was the result of relocation. The records of pupils were checked to insure that all outstanding requirements would be met.

Medical Care

During the year there was a marked decrease in the activities of the maternity service as compared with that of the previous year, accounted for largely by the departure of a great many young married people. Total births were 1,745; deaths 541.

When the exclusion order was lifted, there were 700 patients under War Relocation Authority's general custodianship in West coast hospitals, including approximately 250 tuberculosis patients hospitalized there prior to evacuation; 108 mental cases transferred to institutions in their States of legal residence, following commitments from centers, and the remainder, chiefly mental patients hospitalized over a long period. Arrangements were made as of June 30, 1945,

for discontinuance of financial responsibility for hospitalization for 343 patients at approximately \$900 per day.

A January survey showed there were 190 tuberculous patients in the various center hospitals who would need long-time sanatorium care, and a gradual transfer of these patients to the west coast was begun in the spring. At the same time individual interviews were held with over 200 tuberculous patients in west coast hospitals and reports of these interviews were sent to the appropriate centers in order to further relocation by correlating the plans of the patients with those of their immediate family members.

Fire Protection

With millions of dollars of value and thousands of buildings under their guardianship, fire protection crews at the centers established an enviable record of only 245 fires during the year, with a total loss in buildings and contents of \$37,652, of which \$25,310 was Government property and \$12,342 private property. Granada center recorded only 10 fires; Poston with the greatest number had 48. Manzanar accounted for \$19,264 of the total loss of which \$19,051 resulted from the burning of three Government warehouses. The smallest loss at any center was \$170 at Central Utah.

ADMINISTRATIVE MANAGEMENT

Administrative aspects of center closures involved huge physical assets which must be accounted for and disposed of in an orderly manner. Teams composed of accountants and property experts were sent into the centers where all property records were being put in order, as the fiscal year closed. Surplus properties were listed and a conservation program was adopted which entailed an exchange of materials and supplies between centers. Under this procedure things needed in each center were listed, and where these needs could be filled from the surpluses of other centers, transfers were effected.

Procedures for mess operations were overhauled and a policy adopted that would require the closing down of a block mess hall when the population in a block dropped to 125 residents. This resulted in a considerable saving of manpower and supplies, as many blocks throughout the various centers fell within the scope of the closing order. As a further conservation measure, food stocks which had been carried on the basis of a 60 to 90 day supply, were reduced so that quantities on hand were sufficient for only 20 to 30 days.

A procedure was also developed for the final disposition of all War Relocation Authority records, and the schedule which was recommended to the National Archives and the Congress was given the stamp of approval, and put into effect.

Among other problems which the War Relocation Authority faced during its liquidation period was the question of what would happen to its hundreds of civil service employees. In an effort to find an answer, a personnel survey was conducted in the spring of 1945 to determine possible placement of staff members with other Government agencies. On July 1, 1944, there were 2,284 employees, 2,015 of whom were stationed in the field, while 269 staffed the Washington offices. On June 30, 1945, the total employment was 2,436, an increase of 152, as the relocation program was being developed into its final phases. Most of this increase was in the field, where the total reached 2,154, with 282 in the Washington office.

LEGAL DEVELOPMENTS

Litigation of vital concern to the evacuees, both in and out of the centers, was spread on the records during the year.

On December 18, the United States Supreme Court handed down decisions in the Fred Korematsu and Mitsuye Endo cases. In the former, the legality of the evacuation orders was sustained. In the latter the court held that the War Relocation Authority had no authority to detain and control the movements of citizens who were concededly loyal to the United States. Although the War Relocation Authority in anticipation of War and Justice Department assumption of responsibility for security measures, had been shaping its policies toward elimination of its leave clearance requirements in any event, the Endo decision made it unmistakably clear that detention of citizens solely on the grounds of race or ancestry could not be sustained before the courts.

Land laws aimed at alien Japanese began to crop up in various States. The Oregon Legislature adopted a law making the possession or ownership of land by Japanese and other aliens ineligible for citizenship a criminal offense, and amending the rules of evidence for the trial of cases arising under the State alien land law. A proposed Colorado constitutional amendment to authorize restrictions on ownership of land by aliens failed in a referendum in November. In California, a referendum petition for an amendment to the State alien land law to extend it to "dual" citizens as well as aliens ineligible for citizenship and to the ownership of watercraft as well as land failed for lack of a sufficient number of signatures. This same amendment was introduced in the State legislature at its session which closed in June, but failed to pass. Law enforcement officials in California instituted 28 civil suits to forfeit to the State land alleged to be held by Japanese aliens and the State of Washington instituted 13 similar civil suits.

SEGREGATION CENTER

As it became increasingly apparent that the West coast exclusion would eventually be rescinded and War Relocation Authority leave regulations simultaneously abolished, plans were developed for setting up relocation machinery at the Tule Lake Segregation Center. Under regulations of the Western Defense Command, it was anticipated that quite a large number of these evacuees would be eligible for resettlement on the west coast as well as elsewhere in the United States.

A policy was adopted for Tule Lake similar to that in effect for other centers and by the time the ban was lifted on January 2, the administration was ready. Prior to this time there had been only slight interest in relocation, but in January inquiries began to trickle into the newly established relocation office in the center. The first person to relocate from Tule Lake since it had been designated as a segregation center was a young man who departed for Minneapolis late in the month.

In the period between that time and the close of the fiscal year, 140 persons relocated directly from Tule Lake to outside communities. In addition, approximately 400 residents of Tule Lake who were out on seasonal leave effected permanent departures during this period, or were institutionalized outside, so that a total of more than 500 actually relocated between January 2 and June 30. The population remaining as the fiscal year closed was 17,454.

The fiscal year at Tule Lake got away to a rather turbulent start, with the murder on July 2 of the evacuee manager of the Business Enterprises. This was apparently the culmination of a feud between those evacuees who were willing to cooperate with the administration and those who were not. As a result of the stabbing, the board of directors and all key evacuee personnel of the cooperative resigned. Before the end of July the entire evacuee police force also had resigned, as the investigation into the murder became more intense. The murder was never solved, and the police department was reorganized as the Colonial Peace, to carry on. A reorganization of the Cooperative was also effected, and by the end of July the Business Enterprises were again functioning satisfactorily.

Twenty-seven Nisei were arrested in July, charged with failure to report for preinduction physical examinations, but at their trial at Eureka, Calif., the charges were dismissed when the court held that Selective Service did not apply to residents of Tule Lake, since it was a segregation center. Also in this month 16 men held in the Stockade, where the more belligerent were confined, went on a hunger strike which lasted 10 days.

There followed a period of agitation for "resegregation" by the pro-Japanese group, which began to promote Japanese culture through three societies, Sokuji Kikoku Hoshi Dan, for older men; Hokoku Seinen Dan, for younger men and Hokoku Joshi Dan for women. These societies sponsored early morning marching formations by their members and engaged in other pro-Japanese rituals intended to develop more strongly the Japanese pattern of living. These practices subsided, however, and much of the resegregation agitation also, with removal of 56 of the leaders to the internment camp at Crystal City, Tex.

In December the Department of Justice completed hearings on another 56 men who had asked expatriation, and these, together with 14 aliens, were transferred to the interment camp at Santa Fe, N. Mex. They left Tule Lake on December 28, 10 days after announcement of the lifting of the West coast ban. This announcement and the accompanying announcement of the liquidation of the other centers had a dampening effect on any demonstration by the population. In all, 1,416 persons were removed by the Justice Department from the Tule Lake center to interment camps during the fiscal year.

EMERGENCY REFUGEE SHELTER

On June 30 the Emergency Refugee Shelter at Fort Ontario, Oswego, N. Y., completed its first fiscal year under the administration of the War Relocation Authority, which was first designated for this responsibility on June 9, 1944.

While plans were being made to receive the European refugees as the 1944 fiscal year closed, the War Relocation Authority did not actually assume custody of the Fort Ontario grounds until July 30. Six days later, on August 5, the refugees arrived at the Shelter where housing had been prepared for them on the old fort grounds.

In the group were 982 persons ranging in age from infants to octogenarians, representing 18 nationalities. The largest national groups were 367 from Yugoslavia; 244 from Austria; 149 from Poland; 94 from Germany and 41 from Czechoslovakia. Others were from Belgium, Bulgaria, Danzig, France, Greece, Holland, Hungary, Libya, Rumania, Russia, Spain, and Turkey.

With so many nationalities represented the Administration was faced with complex problems caused by language, geographic and cultural differences. However, a plan of community organization was set up similar to that which had been operating in the relocation centers, with the exception of schools. Arrangements were completed on September 1, with school authorities in the adjacent town of Oswego, whereby the children of the refugees would be accepted on the same basis as American children. With the opening of classes, 189 of these children were enrolled.

Although the refugees were brought into the United States outside immigration quotas and were required to sign an agreement which stated that they understood they were to return to their homes after the war, it soon became apparent that the majority had no desire to return, that many had close relatives in the United States, and that most sections of liberated Europe were in no position to receive them. The most feasible alternative was to develop procedures under which those who desired to remain in America could be admitted under quotas which had not been filled since the start of the war. Early in the spring the War Relocation Authority began exploring the possibility of such a program, with the Departments of State and Justice, but no definite conclusions were reached by the end of the fiscal year. Meanwhile, members of the subcommittee of the House Committee on Immigration and Naturalization conducted hearings at the Shelter on June 25-27, inclusive, to determine the possibility and advisability of extending immigration status to the Shelter residents. As the year closed, this subcommittee had not yet announced its findings.

During the year there were 14 permanent departures from the Shelter. One person left on February 28 for the Union of South Africa, and 13 others returned to Europe on the Gripsholm on May 30. There were 10 deaths and 11 births during the year, leaving a net population of 969 as of June 30.

On June 6, the over-all responsibility for the Shelter program was transferred by order of the President from the War Refugee Board to the Department of the Interior.

CONCLUSION

As the War Relocation Authority approached the end of its unique experience in caring for a displaced racial segment of the American population, it becomes somewhat easier to evaluate that experience in proper perspective and to derive from it certain basic recommendations for the future.

First, the War Relocation Authority earnestly hopes that the United States will never again be faced with a similar problem.

Second, the Authority recommends strongly against putting displaced people in camps except for limited periods and under emergency conditions, such as natural catastrophe, where there is no feasible alternative.

Third, this agency has learned the grave dangers that lie in generalizing about a whole group of people and restricting their movements on the basis of such generalization. It believes deeply that no resident of this country should be detained or moved against his will merely because he is a member of some group. All actions of this kind should be based on painstaking examination of the person's individual record.

Fourth, the War Relocation Authority is under no illusions that it has completely solved all problems of the evacuated people of Japanese descent. After the last War Relocation Authority field office is closed, there will still be a tremendous job for American democracy in helping these people to become satisfactorily readjusted and in safeguarding their rights against the poison of racial discrimination. But this is a job which can be done most effectively by private organizations and individuals working close to the problem in the scores of communities where the resettling evacuees have made their homes. For more than 2 years the Authority has been encouraging such groups to assume an increasing measure of responsibility for evacuee adjustment and for protection of evacuee rights. It now looks forward to the termination of its own official life with full confidence that the work of fitting the evacuated people back into the main stream of our natural life will be carried forward with energy and zeal.

Board on Geographical Names

MEREDITH F. BURRILL, *Director*

In the latter part of the fiscal year 1943 the present Division of Geography which, together with the interdepartmental Advisory Committee constitutes the Board on Geographical Names, was greatly expanded to enable it to formulate quickly policies with regard to geographic nomenclature in areas of actual or potential military operations, and to provide on short notice great quantities of correct geographical names in war theaters. In performing this work the Division has acquired the know-how for dealing with nomenclature problems and has developed techniques for rapidly processing large numbers of names in a given area. This has enabled the Division to edit maps and manuscripts and to check lists involving hundreds of names in a relatively short time. These nomenclature policies going beyond the well-known names that appear on all small scale maps, these techniques for handling large numbers of names, and the acquisition of general experience with geographical names are important facilities which the Division of Geography is in a position to place at the disposal of the agencies concerned.

Great strides in the formulation of policy have been made following clarification of the working relations of the Division of Geography and the interdepartmental Advisory Committee by Departmental Order No. 2002 dated October 26, 1944, and published in the Federal Register for November 1, 1944. The Federal agencies and private geographical societies represented on the Advisory Committee on June 30, 1945, were as follows: Government Printing Office, Library of Congress, State Department, Office of the Chief of Engineers, Military Intelligence Service, Post Office Department, Office of Naval Intelligence, Hydrographic Office, Forest Service, Bureau of the Census, Coast and Geodetic Survey, Geological Survey, National Archives, American Geographical Society of New York, the Geographic Society of Chicago, Geographical Society of Philadelphia, and the National Geographic Society.

The need for readily available source materials to accomplish the work for the armed forces required the acquisition of a map collection of approximately 100,000 maps and a library of 12,000 volumes pro-

viding material applicable to the name problem. This is one of the largest general map collections in the United States and it is the only library of any size specializing in place-name materials.

In the course of war work the master card file with the cooperation of the armed services has been built up from 18,745 names to 990,390 names. This file is a facility which is believed to have no counterpart anywhere. In addition to the 33,273 names on which decisions have been rendered, more than three-fourths of the others have been processed according to standard directions, with extensive cross-referencing of variant names. In addition to the master card file a Mongolian word file of 30,000 cards has been compiled to decipher Mongolian names which consist almost entirely of descriptive terms. At the present time there is no comparable English-Mongolian dictionary in existence.

The replacement value of the card files, the name decisions, the map collection, and the library of the Division of Geography is estimated conservatively at \$850,000.

The value of the services of the Division of Geography to agencies concerned with place names is commensurate with the extent to which they use it and the completeness with which they rely upon it. Full value and complete consistency with regard to name usage can be gained only by a centralization of work on geographic nomenclature.

With the aid of the name file now at hand the Division of Geography is prepared to handle with a minimum of additional research all normal peacetime requests of Government agencies for names in the theaters of World War II and most such requests for foreign names in other parts of the world.

With the close of hostilities it is planned to apply the techniques, facilities, and experience developed during the war to the backlog of approximately 4,500 domestic name problems which have accumulated while high priority war work postponed their solution. It is further planned to anticipate name problems in areas where large domestic mapping programs are going to be conducted by compiling state or territorial gazetteers for which each name will be processed. Eventually the entire Nation and each of the territories will be covered by such a gazetteer which should reduce to a minimum name problems arising from future mapping programs on a scale of 1:62,500 or smaller.

Office of the Solicitor

FOWLER HARPER, *Solicitor*

SSTREAMLINING of review and advisory procedures enabled the Solicitor's Office, during the past fiscal year, to devote a major part of its efforts to the legal implementation of departmental programs for peacetime reconversion, while continuing to carry its regular load of normal departmental legal work and the extra load imposed by departmental war activities in fuel, mineral, territorial, and various other fields. Legal programs have been formulated for the broader use of the public domain; the extension and improvement of the Federal range for grazing purposes; the resumption of operations on a peacetime schedule of the vast recreational, scenic and historical facilities of the National Park System and the accommodation of the millions of expected visitors who have been unable to avail themselves of these facilities in recent years because of wartime restrictions to travel; the exploration for and the development of the mineral resources of the country; the completion of the vast reclamation projects interrupted by the war; the social and economic development of the territorial and island possessions; the programs for land utilization in aid of the sound rehabilitation of thousands of returning veterans; the development of public power; the disposal of surplus property; and many others embodied in pending or proposed legislation.

Most of the programs for reconversion have been conceived in legislation presented to the Congress and nearly all are related more or less intimately to activities of the Department. The future of the light metals industry—aluminum and magnesium—was the subject of extensive hearings before a committee of the Senate, at which the Nation's leading industrial and governmental authorities, including Secretary Ickes, and the heads of several affected departmental agencies, testified. The future of this industry is closely interwoven with the Department's interests, especially in the programs of the Geological Survey, the Bureau of Mines, and the several Federal power agencies, and the questions of law involved are manifold.

The pattern for the future is clearly reflected in legislation proposed and sponsored by the Nation's industrial, scientific and military leaders, including proposals for the resurvey of the Nation's mineral

reserves as the basis of future control and beneficial use; for the creation of a minerals stock pile for industrial and military requirements; for scientific research and development; for the release to industry generally of scientific knowledge acquired in this war from allied and enemy sources; and for the control of patents developed in whole or in part with Federal funds.

Proposals for postwar scientific research and development which have been presented to the Congress have raised questions of law demanding the most careful consideration, since hardly a bill has been introduced which would not duplicate, supersede, or at least curtail existing activities in this field now authorized to be conducted by Bureaus of the Department. The proposals for the stock piling of strategic materials were and will continue to be major legal and legislative problems of Department-wide concern.

The equitable control of patents developed with the aid of Federal funds and the prevention of the monopolistic exploitation of such patents, is the subject of much concern to both industry and the Congress. The Mines Division of the Solicitor's Office has been engaged in drafting regulations with respect to the granting of licenses and the protection of the Government's interests in departmental patents. Many of these patents, including a recent application for one covering a device to locate ores required in the development and control of atomic energy, are of great importance in the future economy of the Nation.

The bills to create regional authorities affect virtually every activity of the Department, and if enacted doubtless would incorporate many of the functions now performed by several departmental agencies—those of the Bureau of Reclamation would be particularly affected as would also those of the Bureau of Mines, the Geological Survey, the National Park Service, the Grazing Service, the General Land Office, the Fish and Wildlife Service, the power projects and other conservation activities. The preparation of reports for congressional committees considering these measures, the marshalling of facts upon which the Secretary and the heads of the various bureaus could base their testimony before those committees and the questions of law involved required months of legal research, preparation and analysis on the part not only of the Legislative Division of the Solicitor's Office but, also, of the lawyers of the bureaus involved.

As the plans develop for the future the vast amount of legal work which is inevitably bound up in the evolution of the reconversion programs becomes discernible. While the Legislative Division of the Solicitor's Office has been the clearing house for proposals originating in the Congress, or proposed for enactment by the Department, the entire legal staff of the Department necessarily has participated to the extent that plans affected a particular agency and its normal, peacetime functions.

SOLID FUELS ADMINISTRATION FOR WAR

The Legal Division of the Solid Fuels Administration for War drafted regulations and orders embodying the Administration's program for the distribution of limited supplies of bituminous coal, anthracite and other solid fuels. It prepared interpretations of provisions of the regulations and drafted exceptions and directions necessitated by constantly changing conditions in solid fuels' production and consumption. It continued to supervise the organization and functioning of industry advisory groups, and also handled all legal problems in connection with compliance proceedings brought to enforce regulations, and cooperated with the Department of Justice in criminal prosecutions. Following liquidation of the Coal Mines Administration in September 1944, and the transfer of the functions of that agency to the Solid Fuels Administration for War, the Division drafted the documents incident to the seizure and possession of struck coal mines by the Secretary under various Executive orders.

WAR RELOCATION AUTHORITY

On December 18, 1944, the United States Supreme Court announced two decisions of major significance to the program of the War Relocation Authority. They were *Korematsu v. United States*, 323 United States 214 (October 1944), in which the court upheld the constitutionality of the original Army orders excluding all persons of Japanese ancestry from west coast military areas, and *Ex parte Mitsuye Endo*, 323 United States 283 (October, 1944), in which the court held invalid the detention of an American citizen of Japanese ancestry conceded to be loyal to the United States. These decisions preceded by 1 day a revocation of the Army's mass exclusion orders and the institution by the Army of a plan for excluding individually from west coast military areas persons regarded as dangerous to the national security. Following these developments, the Solicitor's Office participated in the development and institution of a program designed to effect an orderly return of all eligible relocation center residents to normal communities and the prompt liquidation of the relocation centers, including the handling of legal problems relating to relocation center management, evacuee property management and disposal, and the rehabilitation of relocated evacuees.

GENERAL LAND OFFICE

The Law Division of the General Land Office handled more than 35,000 matters during the fiscal year, including assistance to the Department of Justice in the preparation of litigation; the rendering of legal opinions on a variety of subjects; claims relating to the public domain; the preparation of proposed legislation and reports on pend-

reserves as the basis of future control and beneficial use; for the creation of a minerals stock pile for industrial and military requirements; for scientific research and development; for the release to industry generally of scientific knowledge acquired in this war from allied and enemy sources; and for the control of patents developed in whole or in part with Federal funds.

Proposals for postwar scientific research and development which have been presented to the Congress have raised questions of law demanding the most careful consideration, since hardly a bill has been introduced which would not duplicate, supersede, or at least curtail existing activities in this field now authorized to be conducted by Bureaus of the Department. The proposals for the stock piling of strategic materials were and will continue to be major legal and legislative problems of Department-wide concern.

The equitable control of patents developed with the aid of Federal funds and the prevention of the monopolistic exploitation of such patents, is the subject of much concern to both industry and the Congress. The Mines Division of the Solicitor's Office has been engaged in drafting regulations with respect to the granting of licenses and the protection of the Government's interests in departmental patents. Many of these patents, including a recent application for one covering a device to locate ores required in the development and control of atomic energy, are of great importance in the future economy of the Nation.

The bills to create regional authorities affect virtually every activity of the Department, and if enacted doubtless would incorporate many of the functions now performed by several departmental agencies. Those of the Bureau of Reclamation would be particularly affected, as would also those of the Bureau of Mines, the Geological Survey, the National Park Service, the Grazing Service, the General Land Office, the Fish and Wildlife Service, the power projects and other conservation activities. The preparation of reports for congressional committees considering these measures, the marshalling of facts upon which the Secretary and the heads of the various bureaus could base their testimony before those committees and the questions of law involved required months of legal research, preparation and action on the part not only of the Legislative Division of the Solicitor's Office but, also, of the lawyers of the bureaus involved.

As the plans develop for the future the vast amount of legal work which is inevitably bound up in the evolution of the recovery programs becomes discernible. While the Legislative Division of the Solicitor's Office has been the clearing house for proposals originating in the Congress, or proposed for enactment by the Department, its entire legal staff of the Department necessarily has participated to the extent that plans affected a particular agency and its normal peacetime functions.

SOLID FUELS ADMINISTRATION FOR WAR

The Legal Division of the Solid Fuels Administration for War drafted regulations and orders embodying the Administration's program for the distribution of limited supplies of bituminous coal, anthracite and other solid fuels. It prepared interpretations of provisions of the regulations and drafted exceptions and directions necessitated by constantly changing conditions in solid fuels' production and consumption. It continued to supervise the organization and functioning of industry advisory groups, and also handled all legal problems in connection with compliance proceedings brought to enforce regulations, and cooperated with the Department of Justice in criminal prosecutions. Following liquidation of the Coal Mines Administration in September 1944, and the transfer of the functions of that agency to the Solid Fuels Administration for War, the Division drafted the documents incident to the seizure and possession of struck coal mines by the Secretary under various Executive orders.

WAR RELOCATION AUTHORITY

On December 18, 1944, the United States Supreme Court announced two decisions of major significance to the program of the War Relocation Authority. They were *Korematsu v. United States*, 323 United States 214 (October 1944), in which the court upheld the constitutionality of the original Army orders excluding all persons of Japanese ancestry from west coast military areas, and *Ex parte Mitsuye Endo*, 323 United States 283 (October, 1944), in which the court held invalid the detention of an American citizen of Japanese ancestry conceded to be loyal to the United States. These decisions preceded by 1 day a revocation of the Army's mass exclusion orders and the institution by the Army of a plan for excluding individually from west coast military areas persons regarded as dangerous to the national security. Following these developments, the Solicitor's Office participated in the development and institution of a program designed to effect an orderly return of all eligible relocation center residents to normal communities and the prompt liquidation of the relocation centers, including the handling of legal problems relating to relocation center management, evacuee property management and disposal, and the rehabilitation of relocated evacuees.

GENERAL LAND OFFICE

The Law Division of the General Land Office handled more than 35,000 matters during the fiscal year, including assistance to the Department of Justice in the preparation of litigation; the rendering of legal opinions on a variety of subjects; claims relating to the public domain; the preparation of proposed legislation and reports on pend-

ing bills; the drafting of regulations affecting the public domain and certain hearing procedures; and assistance rendered to congressional committees on proposed surplus property legislation and on various questions with respect to the administration of minerals in the public lands, particularly those relating to the leasing of potassium resources, the legality of withdrawals of public lands made by the Secretary of the Interior, and the purpose and effect of the potassium leasing regulations of January 4, 1945.

GRAZING SERVICE

The Office of the Chief Counsel of the Grazing Service continued to handle an increasing volume of work, including the interpretation of statutes, rules and regulations, and orders affecting the administration of the Federal range; the preparation of contracts and cooperative agreements with individuals, livestock associations, State cooperative grazing districts, and Federal and State agencies; the drafting of proposed rules and regulations, instructions and forms necessary to administer the Taylor Grazing Act; the codifying of rules and regulations for publication in the Federal Register; and many other related subjects.

BUREAU OF RECLAMATION

During the past year, apart from the time devoted to wartime activities, the attorneys of the Bureau of Reclamation, both in the Office of the General Counsel in Washington and in the field, have been engaged in the formulation of plans and the preparation and revision of contracts looking toward a return of the Bureau to its peacetime role and the early resumption of irrigation and other construction projects suspended during the war in accordance with War Production Board regulations. Part of a series of 37 basin reports, to be submitted to the Congress, providing postwar plans for the comprehensive development of the water, land, and hydroelectric power resources of the major basins of the West, are receiving legal review as of the writing of this report. Contracts were drafted involving the disposal of metropolitan water district unused electric energy, heretofore sold to Defense Plant Corporation for use in its magnesium plant, to the city of Los Angeles, Southern California Edison Co., and the California Electric Power Co. Negotiation of repayment contracts with the three irrigation districts of the Columbia Basin project, Central Valley project studies, the organization of three Montana irrigation districts, the treaty between the United States and the United Mexican States relating to the utilization of the waters of the Colorado, Tijuana, and Rio Grande Rivers, and numerous other intricate legal problems involving the multiple-purpose projects of the Bureau, demanded the attention of the Legal Division. Bureau attorneys conducted or participated in a variety

of court cases arising in connection with Federal reclamation. After years of litigation, the United States Supreme Court on June 11, 1945, finally handed down an opinion in the best known and perhaps the most important case, *Nebraska v. Wyoming and Colorado, United States, Intervener*, defining the scope of State and Federal authority in interstate streams.

GEOLOGICAL SURVEY

The Office of the Chief Counsel, Geological Survey, has furnished the legal implementations of the bureau's program in the search for and utilization of the Nation's mineral resources. It participated in the negotiation of 22 new unit agreements embracing 198,408 acres providing for immediate exploration and development of wildcat areas for oil and gas—to discover new oil reserves to replace dwindling known reserves. Seven communitization agreements were approved for the pooling or consolidation of Federal and non-Federal lands required under regulations of the Petroleum Administrator for War as a condition prerequisite to the use of material in drilling wells—a program designed to conserve vital materials without impeding maximum production. An agreement between the Navy and Interior Departments was consummated with respect to the supervision of the lands embraced within the Naval Petroleum Reserves.

An important victory was won in the case of *United States v. General Petroleum Corporation, et al.*, involving additional royalties claimed to be due the United States from the holders of Federal oil and gas leases in the Kettleman Hills oil and gas field, California. The United States District Court held that the Secretary of the Interior has the power, under the Mineral Leasing Act of February 25, 1920, to determine the value of oil, natural gas, and natural-gas gasoline, or any of them, which ruling, if it becomes final, will result in the recovery of additional royalties estimated roughly at \$1,500,000. The Chief Counsel's Office engaged in the defense of the case of *The Ohio Oil Company v. United States*, brought to recover oil and gas royalties alleged to have been wrongfully exacted by the Secretary of the Interior and, although this suit involves only \$10,000, the decision will affect other royalties paid to the United States amounting approximately to \$250,000.

NATIONAL PARK SERVICE

The Office of the Chief Counsel, National Park Service, during the fiscal year handled a large volume of matters involving jurisdiction with respect to hunting, disposal and control of wildlife, and the regulatory powers of the Federal Government over mineral locations and non-Federal lands, in areas administered by the National Park Service, questions with respect to the use of park roads, Federal and

State jurisdiction over parkway crossings, and the Service's authority as to public water reserves and power licenses in national park and monument areas. There were also many legal matters inherent in Service administration, such as water rights, land acquisition, wartime use of areas, drafting and reviewing permits and contracts, preparation of legislation, and assistance rendered the Department of Justice in the Jackson Hole National Monument case of *Wyoming v. Franke*, in which the authority of the Federal Government in establishing the Jackson Hole Monument was upheld by the court in a decision of February 10, 1945. The office had the responsibility for the preparation of the National Park Service law book supplement, as well as the compilation of proclamations, and orders relating to areas in the national park system. The Service's postwar programs of major importance in planning, construction and land acquisition, also required constant legal consideration and counsel.

FISH AND WILDLIFE SERVICE

Participation by the Fish and Wildlife Service, in international fisheries problems became intensified during the year and brought out many questions for consideration by the chief counsel, both in frequent interdepartmental discussions and in the drafting of proposed agreements and legislation. At the same time, studies of the effects on the development and conservation of the wildlife and fishery resources of the numerous proposed irrigation and flood-control projects raised a variety of legal and legislative questions. Proposed legislation relating to the control of pollution and to other specific phases of wildlife conservation affecting long-time programs required the preparation of numerous reports. Of interest were the problems involved in negotiating for the transfer to the government of state lands lying in the Everglades section of the State of Florida. In anticipation of intensified hunting during the 1945-46 season, certain provisions of the migratory waterfowl regulations were revised with a view to offsetting any marked decrease in the waterfowl population.

DIVISION OF TERRITORIES

Implementing the departmental program of increased home rule in the territories, the Office of the Chief Counsel, Division of Territories, in cooperation with the Solicitor's Office, drafted a series of bills for introduction in the Congress and in the territorial legislature. Among the bills so drafted and enacted during the past fiscal year were bills outlawing racial discrimination in Alaska, and providing for a referendum on Alaskan statehood. Conferences with territorial officials and with the War Department culminated in military and presidential proclamations terminating martial rule in Hawaii. The legal staff of the Division of Territories assisted the Department

of Justice in several important cases involving the interests of the Department and the local governments; numerous legal memoranda and opinions with respect to controversial questions were prepared; Executive orders authorizing a variety of activities; and much time was devoted in acting as liaison between the territories and other departments of the Federal Government. The counsel-at-large for Alaska continued to represent the Solicitor and to protect the interests of the Federal Government in the resources of the Territory, handling a most diversified variety of problems affecting property and individual rights.

LEGISLATIVE DIVISION

The variety and volume of matters passing through the Legislative Division continued to increase. Legislation introduced, including reports to committees, the Bureau of the Budget and related correspondence, involved 2,698 items; proposed legislation by the Department, 377 items; legislation proposed by other Departments, 104 items; bills introduced of interest to the Department, 738 items; laws enacted affecting the Department, 101 items. In addition the Division covered all pertinent congressional committee hearings and submitted reports where necessary; prepared or reviewed statements to be made by officials before committees; and participated in all sessions of the Departmental Legislative Committee.

PUBLIC LANDS DIVISION

A substantial part of the work of the Public Lands Division involved questions arising in the administration of the Mineral Leasing Act, particularly with reference to oil and gas matters. Considerable time was devoted to cooperation with a committee from the oil industry in considering suggestions for amendments to the act. The possibility of augmenting the Nation's future oil supply from deposits in submerged coastal lands below low tide and the propriety of Federal administration of these reserves also engaged much attention. An original Supreme Court proceeding to determine title to the mineral rights in these lands is being urged as the appropriate method of settling this question. With the aid of the Division in preparing appropriate regulations and a form of cooperative agreement, an outstandingly important program for sustained timber yield, the first of its kind, was put into effect for the revested Oregon and California railroad lands, reconveyed Coos Bay Wagon Road lands and intermingled State, county, and privately owned timberlands. The Department's policy of conserving isolated tracts for their most economic use, including possible inclusion in Federal, State, or local projects, was clarified and public sales of such tracts approved only after careful consideration. Effective progress was also made in an effort to eliminate foreign control of valuable public land de-

posits of sodium borates and various forms of potassium as minerals vital to our national economy. The Division actively conducted litigation seeking to preserve title in the United States to rich sodium borate lands and railroad grant lands and to sustain administrative practice under the Mineral Leasing Act.

CONSERVATION DIVISION

Matters of outstanding interest handled by the Conversation Division during the fiscal year were original opinions with respect to the excess-land provisions of the reclamation laws; the application of Canada-United States trade agreements to action proposed under amended salmon fishery orders; the acreage limitations on grazing districts under the Taylor Grazing Act; power rate schedules, interest requirements, repayment periods, and minimum revenue requirements for power generated and sold from the Columbia Basin (Grand Coulee) power project; advice to the Governors of Puerto Rico and Alaska as to the extent of their authority in certain matters; questions concerning the liquidation of prewar debts in Japanese currency during Japanese occupation of Manila; and questions of Philippine Constitutional law growing out of the reoccupation of the Islands by the American Forces.

In addition to the usual volume of inquiries involving all phases of personnel and fiscal law, new questions arose with respect to the application of the war overtime pay statutes; the assignment of Federal personnel for duty in foreign countries; the acceptance of foreign-national trainees for assignment within the Department under the Government's over-all cultural-cooperation program; emergency employment of aliens, and the effect of the President's order of June 6, 1945, transferring to the Secretary of the Interior over-all responsibility for the Emergency Refugee Shelter at Oswego, N. Y. The Division continued to render opinions on questions submitted from all bureaus of the Department on matters affecting delegation of authority, damage claims, and administrative findings on appeals from contracting officers' findings of fact, as well as contract matters generally. Of particular interest in connection with the latter was the termination of a contract with private contractors for the construction of an oil refinery in foreign territory, and the negotiation and settlement of a claim by the Department against the operator of the Department's cafeteria.

MINES DIVISION

The Mines Division continued to serve in the dual capacity as a branch of the Solicitor's Office and as counsel for the Bureau of Mines. Among the important services performed has been the work involving patents. Some 67 new inventions have been processed for the De-

partment and 9 for the Synthetic Liquid Fuels Division; 35 Solicitor's opinions have been written concerning the rights of inventors, and 15 patents have been secured through the services of the Department of Justice, 10 of these are assigned outright to the Government. There are pending in the Patent Office approximately 120 patent applications. An amendment to the departmental patent regulations and a new set of regulations governing the granting of licenses under patent rights, if adopted, will centralize the licensing system, protect the Department's interests in inventions and make possible control over information concerning the state of the Department's title to patents.

The Division advised in the establishment of the synthetic liquid fuels program; 31 contracts were processed, 9 inventions studied and applications are going forward to the Patent Office. It is anticipated that this work will assume greater importance as the synthetic liquid fuels program develops. The work of explosives control increased materially; 35 license revocation proceedings were prosecuted. A bill to continue the safety features of wartime explosives control has been drafted and submitted to the industry for discussion.

During the year approximately 200 contracts were reviewed, drafted, redrafted or approved, including approximately 60 for exploratory drilling, 33 for supplies, 25 for cooperative ventures, 35 for architects, engineers, and construction, 10 for mining operations, and other miscellaneous matters including helium.

The Division directed a cooperative in-service training program for attorneys of the Interior Department and 14 cooperating agencies.

PROPERTY ACQUISITION DIVISION

The Property Acquisition Division participated in the preparation of contracts for the purchase of properties and performed the legal work in connection with land acquisitions required for the helium program, synthetic liquid fuels program, and mineral exploration programs of the Bureau of Mines for war and postwar use. It reviewed abstracts of title to more than 237 separate parcels involving over 211,650 acres of land acquired by the Government under the Forest Exchange and the Taylor Grazing Act, and also approved title to thousands of acres of donated land accepted by the Government for national parks. The consolidation of Indian land holdings into usable economic units and the acquisition of homes for Indians also involved considerable detailed legal work.

INDIAN DIVISION

The work of the attorneys of the Indian Division of the Solicitor's Office in cooperation with Bureau lawyers has been directed in great measure toward the fulfillment of long standing treaty and other obligations of the Government to the Indians. A final settlement with

the State of Wisconsin brings to a close a 91 years' controversy over the title to certain lands located within the boundaries of the Menominee Indian Reservation and effectually restores them to the Indian reservation. Hearings were held in Alaska to determine native fishing and other occupancy rights which have been matters of controversy for many years. Assistance was rendered to the House Committee on Indian Affairs in preparing an Indian claims bill which would attempt to settle, once and for all, any and all claims of Indians against the United States. The Department's position in the protection of Indian land titles was sustained in the case of *United States v. Drummond*, 324 U. S. 316, involving the interpretation of highly complicated laws pertaining to Osage Indians in Oklahoma; the court also ruled the United States to be a necessary party to actions in State courts in order that it be bound in Indian cases. The Division also participated in the preparation and presentation of other important cases including *Anglin & Stevenson*, 145 F. (2d) 622, holding that the Federal court could determine an award of attorney fees out of the restricted estate of a deceased member of the Five Civilized Tribes in a suit involving the quieting of title and determination of heirs; *United States v. Board of Commissioners of Fremont County*, 145 F. (2d) 329, holding that lands purchased with funds of an Indian tribe, conveyed to United States in trust for the tribe, are not subject to State taxation; *House v. United States*, 144 F. (2d) 555, 65 Sup. Ct. 270, upholding the right of the United States to maintain a suit for accounting of funds of a full-blood Indian of the Five Civilized Tribes released by the Superintendent without authority of law; *Board of Commissioners of Osage County v. United States*, 145 F. (2d) 1022, affirming the decision of the lower court that the act of June 20, 1936 (49 Stat. 1542), as amended, exempting certain Indian-owned lands from taxation, applied to Osage Indians, and that designation of the homestead as provided in the act is not a condition precedent to the tax exemption granted by the act where the Indian owns more than 160 acres of purchased land; and *County of Thurston Nebraska v. United States*, 149 F. (2d) 485, upholding the constitutionality of the tax exemption acts of June 20, 1936 (49 Stat. 1542), May 19, 1937 (50 Stat. 188), as applied to lands purchased by Indians in the State of Nebraska.

Legislation affecting the restricted lands of Indians of the Five Civilized Tribes was introduced in the present Congress looking to the quieting of titles affected by the decisions of the Federal courts in the cases of *United States v. Hellard*, 322 U. S. 363; *Murray v. Ned*, 135 F. (2d) 407, and *Williams v. United States*, 139 F. (2d) 83. The departmental reports to the congressional committees were prepared in this Division and several amendments suggested therein were adopted by the Congress. Act of July 2, 1945 (Public Law 116, 79th

Cong., 1st sess.). A bill (H. R. 2294) was introduced during the year which if enacted would provide a uniform code of descent of restricted Indian lands. Legislation establishing a new technique in securing repayment of construction charges on Indian irrigation projects was favored by the Division. Act of July 14, 1945 (Public Law 149, 79th Cong., 1st sess.).

The work of the Indian Division during the year relating to war activities involved the giving of legal advice and the review of correspondence, leases, permits and other agreements looking to the discovery and development of strategic minerals and the utilization of Indian and public lands for military purposes and increased food production. Several hundred thousand acres of virgin land in Wyoming, Montana and other States were placed under geological and geophysical prospecting permits during the year.

Division of Information

JOHN E. RYCKMAN, *Director*

DURING most of the 1945 fiscal year the Division of Information was still occupied largely with keeping the public acquainted with the Department's single-minded efforts to supply the essentials of war unstintingly from the Nation's natural resources. Before the year's end, however, with the collapse of the Nazi regime and with unmistakable signs of a similar denouement in the Pacific, the Division began to prepare for a shift of emphasis from the profligate expenditure of nature's treasures to the Department's traditional policy of conservation.

Just as foresight had prepared the Department for an immediate shift to a war basis before nightfall on Pearl Harbor Day, plans had been in the making for more than a year against the possibility of an immediate peace.

Thus, while still conforming to Office of War Information and other wartime security regulations in the handling of such informational programs as the Solid Fuels Administration for War, in exercising judicious restraint in disseminating information regarding the important war-related work of the Bureau of Mines, the Geological Survey and other agencies, the Division was getting ready to resume its peacetime activities that so long had lain dormant.

For example, the Division originated and prepared a comprehensive series of articles dealing with the Department's plan to proceed with postwar construction and conservation programs designed to give employment to veterans equivalent to 1,500,000 man-years of work over the first 10 postwar years. This material was published, with appropriate illustrations, in whole or in part by at least a score of nationally circulated magazines.

Before the end of the year the Division also was responsible for writing and publishing a pamphlet entitled "Our Last Land Frontiers," designed as a guide to veterans in their desires to settle on public lands both in continental United States and Alaska. This booklet proved to be one of the most popular ever issued by the Department with 20,000 copies being distributed by the Department

alone, and many other thousands through veterans' organizations, and through separation centers of the armed forces.

In addition to the booklet, the Division prepared a synopsis in popular form which was published by several national syndicates serving several thousand daily and weekly newspapers and by a dozen or more nationally circulated magazines.

These are merely examples of the directional work of the Division designed to integrate the informational programs of the Department's various bureaus and offices having to do with the development and wise use of such natural assets of the Nation as metals, power, fuel, helium, food, land, timber, and fisheries.

In other words, the Division continued to function as the directing and coordinating office of the Department through which all informational material is channeled from the bureaus to the public. This applies not only to day-to-day press releases of general circulation but also to books and pamphlets prepared by the Bureaus on specialized subjects, over which general printing supervision is exercised by the Publications Section.

The Division was also responsible for the editing, designing the format and supervision of the printing of the Secretary's annual report, as well as for the publication of *Inside Interior*, a monthly newspaper intended to keep the Department's own employees abreast of its activities.

There were no appreciable changes in the organization set-up of the Division, consisting of the Director's office, Radio, Publications, and Photographic Sections, although some changes in assignment of duties have been effected as changing conditions required.

RADIO SECTION

Throughout the year the Radio Section, operating the only modern broadcasting and recording studios in the Government, continued its intensified war service to most war-engaged Federal agencies, under the general supervision of the Director of Information.

Extensive and almost constant use was made of the studio's facilities by the Office of Strategic Services and by the Army and Navy in the preparation of secret programs having to do with psychological warfare. Special training programs were recorded for use in every theater of operation, and, toward the end of the fiscal year, recordings were already begun for use in demobilization work on ships and in Army centers of concentration.

Numerous live programs, as well as recordings, were prepared and broadcast through these facilities for overseas use by the Office of War Information and other agencies affiliated with it. In this work as many as 29 different foreign languages were used.

In addition, special programs, spot announcements, and other material for broadcast were produced for such departmental agencies as the Solid Fuels Administration for War and the War Relocation Authority.

One of the outstanding jobs performed by the Radio Section was the complete production of a series of six 15-minute recordings entitled "This Is Puerto Rico," prepared under the auspices of the insular Government of Puerto Rico. This series, an educational and documentary feature, was designed for use in more than 2,500 high schools of the country to acquaint the rising generation with this American outpost in the Caribbean.

PUBLICATIONS SECTION

The enlarged functions, begun last year, by which the Publications Section is made responsible not only for the procurement of printing but also for editorial content and format of bureau publications, have been continued with obvious success.

Not only have important economies been effected by centering in this section the power to reject faulty or undesirable manuscripts, but better design and more attractive publications have resulted. There is still much to be done in presenting to the public a better-rounded set of publications on the Department's activities. But a good start has been made and further improvements will be accomplished as the Department gets into its stride of peacetime work.

PHOTOGRAPHIC SECTION

While the major portion of the Photographic Section's efforts were devoted to furnishing photographs and other illustrations to Department agencies directly concerned with the war, it also began preparations for enlarged activities in anticipation of peace.

Toward the end of the year, for example, the Division compiled and published a listing of about 1,000 background photographs selected from many thousands of negatives in the Department's photographic files. The list of selected photographs, depicting historic landmarks and other subjects of permanent interest to students of the Nation's natural resources, was furnished to editors of important newspapers, magazines, and photographic syndicates as a backlog of available illustrative material upon which they are privileged to draw in connection with stories or articles dealing with any of a large number of subjects within the Department's purview.

During the year the Division also inaugurated a fortnightly News Picture Service, by means of which photographs of current interest are distributed to about a score of news picture syndicates, illustrated feature services, magazines, and newspapers. Thus, the Department, with comparatively little public expense, is able to enlarge a thousand-

fold its effectiveness in acquainting the public with its varied activities. This service has proved so popular throughout the country that, with the coming of peace, it is contemplated that the Division of Information will be called upon to make it a weekly instead of a fortnightly feature.

These activities of the Photographic Section, while increasingly important, are still virtually incidental to the regular volume of work that it has been called upon to perform. Its principal work, from the standpoint of volume, has continued to consist of furnishing illustrative material for bureau publications, progress reports to Congress and the like, as well as meeting a constant demand for material to illustrate textbooks, guidebooks, pamphlets, and travel literature requested by scientific, trade, and other magazines and publishing organizations.

Division of Personnel and Management

Mrs. J. ATWOOD MAULDING, *Director*

WITH the war continuing throughout another year our immediate problem has been the securing of personnel sufficient in number and quality to meet the war needs. Recruitment has been difficult, especially to meet the continuing demands of the Geological Survey and the Bureau of Mines for geologists, engineers, metallurgists, and other specialized personnel, which has made it necessary to ask for occupational deferments from the military service for some in these groups. Recruitment has also been especially difficult for stenographic and typist positions where the Civil Service Commission has been able to supply few eligibles, and replacements have been dependent upon applicants found by the Department. Special effort has been made to fill as many positions as possible with women, and with men not eligible for military duty. At present fewer than 15 percent of our permanent employees are subject to military service. More women are employed in the Department than ever before, the latest figure being 10,676.

More than 7,500 Interior Department men and women have gone into the armed forces; approximately 500 have been discharged and returned to work. These employees were either placed in their old jobs with no loss of seniority rights or were given higher-grade assignments. One hundred and three of our employees have died in the war and eighteen are missing.

While the number with specialized training and experience deferred from military service is slightly higher than a year ago, this is accounted for by the more liberal policy of the Selective Service System for deferring men over 30 and the necessity for making deferment requests for those found physically unfit for combat. The increase, however, has all been in the older age groups as the number of deferments for those below 30 has been drastically reduced.

The Department continues to fill positions above the entrance grades by promotion from within so far as qualified candidates are available. As part of the program to increase the productive capacity of Interior employees, the Training Section conducted across bureau lines during the year refresher courses in typewriting and shorthand, personnel

administration, secretarial training, and efficiency ratings, as well as orientation classes for new employees. The Department assigned two employees this year to the administrative internship program of the Civil Service Commission.

The Classification Office has allocated approximately 7,811 positions during the year and has made numerous surveys of groups of positions in the field. One of the important accomplishments of the Office has been the establishment of a Standards and Specifications Section to assist in preparing and publishing standards for the allocation of field positions under the Classification Act, which was directed by Executive Order 9512. This will be to a large extent a continuation of studies already started to establish standards for typical positions in the field services of the Department.

On September 8, 1944, the basic policy governing wage-fixing for employees not within the purview of the Classification Act was fixed by Secretarial order. On March 30, 1945, detailed regulations and procedures were issued by the Director of Personnel. In these regulations the procedure fixing rates of pay for ungraded employees by wage boards, which had been followed previously in several bureaus, was extended as a uniform method throughout the Department.

Morale in the Department is high despite the abnormal conditions of war. The number of grievances, disciplinary actions, and appeals of efficiency ratings have continued to run small.

Services to employees relating to group insurance, hospitalization, health, credit, loans, and counseling have been maintained, and with respect to counseling have been implemented further. The recreation program established under the guidance of the employee counseling service is felt to be of inestimable importance as a means of communication between employee counselors, personnel officers, and others interested in employee relations in the Department.

While meeting the immediate war demands, we have tried to strengthen the whole personnel structure of the Department for better administration and postwar expansion. We are proceeding with the program of decentralization, looking to the acceptance of more responsibility by the operating bureaus, the Division being concerned mainly with the formulation of good policies and the maintenance of sound personnel standards. In line with this objective, the Office of the Deputy Director of Personnel in Chicago was discontinued in January 1945, and a delegation of considerable appointing authority was made by the Secretary to the three bureaus headquartered there.

The Division is also gearing itself to the veteran placement problem. As one important step, a veterans placement unit has been established to insure that veterans are apprised of and receive their full rights, and that the Department is able to take advantage of new

Cong., 1st sess.). A bill (H. R. 2294) was introduced during the year which if enacted would provide a uniform code of descent of restricted Indian lands. Legislation establishing a new technique in securing repayment of construction charges on Indian irrigation projects was favored by the Division. Act of July 14, 1945 (Public Law 149, 79th Cong., 1st sess.).

The work of the Indian Division during the year relating to war activities involved the giving of legal advice and the review of correspondence, leases, permits and other agreements looking to the discovery and development of strategic minerals and the utilization of Indian and public lands for military purposes and increased food production. Several hundred thousand acres of virgin land in Wyoming, Montana and other States were placed under geological and geophysical prospecting permits during the year.

Interior Department Museum

H. L. RAUL, *Museum Curator*

THE Interior Department Museum maintains constant and direct contact with the public, through its modern visual educational techniques. It is an efficient instrument to visualize the manifold functions of the Department. More than 100 display cases exhibit material of great historic and scientific interest. They reflect the history, aims, and current activities of the Department, from its beginning, almost a century ago, to the present. Some of them refer to the Department's contributions toward victory.

ATTENDANCE AND FOREIGN VISITORS

During the past year approximately 46,000 persons visited the museum. The Visitors' Register records visitors from every State in the Union with the exception of Delaware. Registrations were received also from Alaska, Hawaii, Philippine Islands, and Puerto Rico. Many visitors from foreign countries also have demonstrated interest in the activities of the Department as illustrated in the museum, and registrations were received from Barbados, Bermuda, Brazil, Canada, China, Colombia, Czechoslovakia, Dominican Republic, England, France, Haiti, Honduras, Italy, Malaya, Mexico, New Zealand, Poland, and Romania.

COLLABORATION WITH BUREAUS

With the assistance of the Bureau of Reclamation, five display cases were completely revised and new material designed to illustrate the double use of water for irrigation and power production, and for war, domestic, and industrial uses. Featured also are methods of flood control, improved navigation, wildlife refuges, and recreational opportunities. Among the revised displays are colorful representations of Central Valley project and building Grand Coulee Dam. One of the recent additions is a new scale model of a modern, 80-acre irrigated farm, showing how water is brought from Reclamation reservoirs to operate an irrigated farm on a year-round basis, and electric fences which separate rotation pastures.

An engraved brass bar, 3 feet in length, designated as the Standard Yard, is exhibited in the General Land Office gallery. This is the original standard which was sent to the Territory of Nevada by the Office of United States Weights and Measures, in June 1861, for the purpose of establishing and checking standard measurements. It was formerly used by the Office of the Surveyor General to check surveyors' chains in surveying the public land. Three large silhouettes entitled "Steamboat and Canal Days," "The Roundup," and "The Sheepherder," totaling 22 feet in length, designed and completed in the museum, were installed in riches over related display cases in the General Land Office gallery. These complete the series of seven historical subjects portrayed by silhouette in this gallery.

A panoramic pictorial enlargement, approximately 12 feet long, portraying the Wyoming Elk Herd, is a new display in the Fish and Wildlife gallery.

In collaboration with the Geological Survey, new material for three display cases and three large wall niches are in preparation.

A large photo-mural, in full color, illustrates the numerous outdoor activities and recreational facilities provided by the National Park Service for residents of the District of Columbia and neighboring communities. This is particularly interesting during the present period of wartime travel restrictions.

Among the special exhibits is a photostat copy of a chart of the northern portion of Luzon Strait, Philippine Islands, which was seized from the Japanese in the Central Pacific, and insignia taken from members of the Nazi armed forces.

COOPERATION WITH OTHER AGENCIES

During the past year the museum has served many organizations, including the San Joaquin Pioneer Museum and the Haggin Memorial Art Galleries of Stockton, Calif.; American and Canadian Sportsmen's Show, Cleveland, Ohio; University of Oregon; State Department; War Department; Navy Department (Office of Naval Records and Library, Taylor Model Basin, and Bureau of Ships). The majority of these services concerned modern display methods, scale model, and diorama techniques. Services in connection with training methods and materials used in visual education and in veterans' rehabilitation programs were rendered to the American Red Cross; Walter Reed General Hospital; and the Disabled Veterans Educational and Reconditioning Service of the Newton D. Baker General Hospital, Martinsburg, W. Va.

Suggestions were outlined in last year's annual report for possible use of the museum's facilities for postwar rehabilitation work, particularly for returning veterans who were on military furlough from this Department.

In addition, special programs, spot announcements, and other material for broadcast were produced for such departmental agencies as the Solid Fuels Administration for War and the War Relocation Authority.

One of the outstanding jobs performed by the Radio Section was the complete production of a series of six 15-minute recordings entitled "This Is Puerto Rico," prepared under the auspices of the insular Government of Puerto Rico. This series, an educational and documentary feature, was designed for use in more than 2,500 high schools of the country to acquaint the rising generation with this American outpost in the Caribbean.

One hundred and three of our employees have died in the war and eighteen are missing.

While the number with specialized training and experience deferred from military service is slightly higher than a year ago, this is accounted for by the more liberal policy of the Selective Service System for deferring men over 30 and the necessity for making deferment requests for those found physically unfit for combat. The increase, however, has all been in the older age groups as the number of deferments for those below 30 has been drastically reduced.

The Department continues to fill positions above the entrance grades by promotion from within so far as qualified candidates are available. As part of the program to increase the productive capacity of Interior employees, the Training Section conducted across bureau lines during the year refresher courses in typewriting and shorthand, personnel

administration, secretarial training, and efficiency ratings, as well as orientation classes for new employees. The Department accepted two employees this year to the administrative internship program of the Civil Service Commission.

The Classification Office has allocated approximately 7,511 positions during the year and has made numerous surveys of group positions in the field. One of the important accomplishments of the Office has been the establishment of a Standards and Specifications Section to assist in preparing and publishing standards for the allocation of field positions under the Classification Act, which was directed by Executive Order 9512. This will be to a large extent a continuation of studies already started to establish standards for typical positions in the field services of the Department.

On September 8, 1944, the basic policy governing wage-fixing for employees not within the purview of the Classification Act was fixed by Secretarial order. On March 30, 1945, detailed regulations and procedures were issued by the Director of Personnel. In these regulations the procedure fixing rates of pay for ungraded employees by wage boards, which had been followed previously in several bureaus, was extended as a uniform method throughout the Department.

Morale in the Department is high despite the abnormal conditions of war. The number of grievances, disciplinary actions, and appeals of efficiency ratings have continued to run small.

Services to employees relating to group insurance, hospitalization, health, credit, loans, and counseling have been maintained, and in respect to counseling have been implemented further. The recreation program established under the guidance of the employee counseling service is felt to be of inestimable importance as a means of communication between employee counselors, personnel officers, and others interested in employee relations in the Department.

While meeting the immediate war demands, we have tried to strengthen the whole personnel structure of the Department for better administration and postwar expansion. We are proceeding with the program of decentralization, looking to the acceptance of more responsibility by the operating bureaus, the Division being concerned mainly with the formulation of good policies and the maintenance of sound personnel standards. In line with this objective, the office of the Deputy Director of Personnel in Chicago was discontinued in January 1945, and a delegation of considerable appointing authority was made by the Secretary to the three bureaus headquartered there.

The Division is also gearing itself to the veteran placement problem. As one important step, a veterans placement unit has been established to insure that veterans are apprised of and receive their full rights, and that the Department is able to take advantage of the

nowledges and skills which they may have acquired while in the service.

A personnel conference was held the week of June 4, in Washington, bringing together the personnel officers of all of the bureaus, including those in the field, for a review of policies and programs and for a look ahead to the reconversion period.

At the close of the fiscal year the Department had 44,453 compensated employees, 4,686 in the Washington metropolitan area, and 39,767 in the field; in addition, there were 1,546 uncompensated personnel.

Interior Department Museum

H. L. RAUL, *Museum Curator*

THE Interior Department Museum maintains constant and direct contact with the public, through its modern visual educational techniques. It is an efficient instrument to visualize the manifold functions of the Department. More than 100 display cases exhibit material of great historic and scientific interest. They reflect the history, aims, and current activities of the Department, from its beginning, almost a century ago, to the present. Some of them refer to the Department's contributions toward victory.

ATTENDANCE AND FOREIGN VISITORS

During the past year approximately 46,000 persons visited the museum. The Visitors' Register records visitors from every State in the Union with the exception of Delaware. Registrations were received also from Alaska, Hawaii, Philippine Islands, and Puerto Rico. Many visitors from foreign countries also have demonstrated interest in the activities of the Department as illustrated in the museum, and registrations were received from Barbados, Bermuda, Brazil, Canada, China, Colombia, Czechoslovakia, Dominican Republic, England, France, Haiti, Honduras, Italy, Malaya, Mexico, New Zealand, Poland, and Romania.

COLLABORATION WITH BUREAUS

With the assistance of the Bureau of Reclamation, five display cases were completely revised and new material designed to illustrate the double use of water for irrigation and power production, and for war, domestic, and industrial uses. Featured also are methods of flood control, improved navigation, wildlife refuges, and recreational opportunities. Among the revised displays are colorful representations of Central Valley project and building Grand Coulee Dam. One of the recent additions is a new scale model of a modern, 80-acre irrigated farm, showing how water is brought from Reclamation reservoirs to operate an irrigated farm on a year-round basis, and electric fences which separate rotation pastures.

An engraved brass bar, 3 feet in length, designated as the Standard Yard, is exhibited in the General Land Office gallery. This is the original standard which was sent to the Territory of Nevada by the Office of United States Weights and Measures, in June 1861, for the purpose of establishing and checking standard measurements. It was formerly used by the Office of the Surveyor General to check surveyor's chains in surveying the public land. Three large silhouettes entitled "Steamboat and Canal Days," "The Roundup," and "The Sheepherder," totaling 22 feet in length, designed and completed in the museum, were installed in niches over related display cases in the General Land Office gallery. These complete the series of 17 historical subjects portrayed by silhouette in this gallery.

A panoramic pictorial enlargement, approximately 12 feet long, portraying the Wyoming Elk Herd, is a new display in the Fish and Wildlife gallery.

In collaboration with the Geological Survey, new material for the display cases and three large wall niches are in preparation.

A large photo-mural, in full color, illustrates the numerous outdoor activities and recreational facilities provided by the National Park Service for residents of the District of Columbia and neighboring communities. This is particularly interesting during the present period of wartime travel restrictions.

Among the special exhibits is a photostat copy of a chart of the northern portion of Luzon Strait, Philippine Islands, which was seized from the Japanese in the Central Pacific, and insignia taken from members of the Nazi armed forces.

COOPERATION WITH OTHER AGENCIES

During the past year the museum has served many organizations including the San Joaquin Pioneer Museum and the Haggin Memorial Art Galleries of Stockton, Calif.; American and Canadian Sportsmen's Show, Cleveland, Ohio; University of Oregon; State Department; War Department; Navy Department (Office of Naval Records and Library, Taylor Model Basin, and Bureau of Ships). The majority of these services concerned modern display methods, scale models, and diorama techniques. Services in connection with training methods and materials used in visual education and in veterans' rehabilitation programs were rendered to the American Red Cross; Walter Reed General Hospital; and the Disabled Veterans Educational and Conditioning Service of the Newton D. Baker General Hospital, Martinsburg, W. Va.

Suggestions were outlined in last year's annual report for possible use of the museum's facilities for postwar rehabilitation work, particularly for returning veterans who were on military furlough from this Department.

LOAN EXHIBITS AND ACCESSIONS

Last October the museum accepted, for an indefinite period, a life-size bust of Thomas Ewing, first Secretary of the Interior, who served from 1849-50. It was loaned to the museum by Mr. Sherman Ewing, a representative of the Thomas Ewing estate. A marble pedestal and bronze inscription plate are also included in this loan exhibit.

A collection of 13 Indian rugs, blankets, saddle blankets, and a dance drum, selected from the Gibson collection, is displayed as a temporary loan exhibit in the radio studio of this Department.

The museum's book collection has been augmented by "Expressions and Impressions," the autobiography of the late A. A. Anderson, which contains many references to early days in the Yellowstone region. This book was presented by the author's daughter, Dr. Eleanor A. Campbell.

SCHOOL CLASSES

In cooperation with various teacher groups and school organizations, the museum has assisted in planning courses in conservation and other activities represented by the Department. Included in these organizations were the Office of Visual Education of the Providence, R. I., Public Schools, and the Fairfax County, Va., Public School System. The museum's special exhibit of strategic minerals has been duplicated, at private expense, for circulation among the schools of Fairfax County, The Virginia Academy of Sciences, and other similar institutions.

ORIENTATION PROGRAMS

During the year the museum added two important services to established governmental employee relations activities. The departmental orientation program for all new employees, managed by the Training Section, Division of Personnel Supervision and Management, was expanded to include explanatory tours of the museum. The administrative intern program, sponsored by the United States Civil Service Commission to promote the development of junior administrative personnel, also included the explanatory tour service in its course of instruction. These students of government administration represented more than 13 agencies.

Conducted tours were given throughout the year to school classes and many other organizations. In some instances unusually large groups attended. For example, the evening tour of 150 persons from the United States Signal Corps, and the Baptist women's organization group of 500 members.

Inquiries were handled daily at the information desk and special services rendered whenever requested. The museum is attractive to the public and of service to the Department. The assistance extended by the officers of the Department and the cooperation given by the bureaus is gratefully acknowledged.

General Land Office:

Review of the year's work:

Public lands for pastures.....

Receipts and expenditures:

Alaskan Fire Control Service.....

Branch of Field Examination.....

Cadastral Engineering Service.....

Oregon and California Revested Lands Administration.....

Estimate of value.....

New problems:

Land settlement opportunities.....

Plans for the future.....

Sustained yield conservation.....

Alaskan development.....

The public lands:

Area of the public lands:

Acreage of lands patented with minerals reserved to the
United States, as of June 30, 1945.....

Homesteads, sales, and other entries.....

Entries and selections, fiscal year 1945.....

Land grants.....

Land exchanges.....

Leases and permits:

Leases other than mineral leases outstanding, as of June
30, 1945.....Mineral leases, permits, and licenses outstanding, as of
June 30, 1945.....

Receipts and expenditures:

Disposition of receipts of the General Land Office, fiscal year
1945.....

Geological Survey:

Alaskan Branch.....

Geologic Branch.....

Topographic Branch:

Conservation Branch:

Classification of lands.....

Mineral lease supervision.....

Field equipment.....

Field surveys.....

Topographic mapping by the Geological Survey in the
United States, Puerto Rico, and Hawaii, to June 30, 1945.....

Funds.....

General office work.....

Library.....

Map Information Office.....

Water Resources Branch:

Activities carried on for other Federal agencies.....

Continuing activities.....

Cooperation with States and municipalities.....

War and postwar activities.....

Work on publications.....

Grazing Service:

Appropriations and allotments.....

Fees collected and distributed.....

Land planning and utilization:

Cooperation with military services.....

Land classification.....

Pierce Act leases.....

Status of grazing districts.....

Range administration:
